

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE AMERICAN CYCLOPÆDIA.

ASHES

ASHES, the solid remains after the burning of combustible substances. When a vegetable or animal substance is burned with free access of air, part of it is resolved into volatile compounds, chiefly water, carbonic acid, and free nitrogen, while the other and generally the smaller portion is left as incombustible residue or ash. If the substance be decomposed with exclusion of the air, a different set of compounds results; and the residue may be charcoal, bone black, or some other substance, depending upon the nature of the material taken for the experiment. Of wood ashes, even the different parts of the same plant furnish different quantities, and ashes of different compositions. The soil itself has an influence upon the kind and amount of materials taken up by the plants. Nearly all the substances found in the soil enter into the composition of vegetable matters, and are found in their ashes. Alumina is, however, very rarely met with. No inorganic substances found in the ashes of plants come from any other source but the soil. Of the portion of wood ashes soluble in water, and removed from them by leaching or lixiviation, the greater part consists of the carbonate, silicate, sulphate, and chloride of potassium. Of the insoluble portion (leached ashes), carbonate of lime commonly forms about one half; the remainder is mostly silicate and phosphate of lime, oxide of iron, and salts of magnesia. It is not supposed that the bases were combined with carbonic acid in the plants, but with organic acids, and that these were replaced by carbonic acid in the process of combustion. Plants that grow in and near salt water contain soda instead of potassa, deriving it from sea salt. The following examples show how the quantity of ashes varies with the wood: From 1,000 parts by weight of oak, well dried, Kirwan obtained of ashes 18.5 parts; from elm, 23.5; willow, 28; poplar, 12.2; ash, 5.8; pine, 3.4. The bark furnishes more ashes than the solid wood, and the branches than the trunk. Peat and coal ashes

contain a large proportion of alumina; oxide of iron, carbonate and sulphate of lime, are also found in them. The principal uses of wood ashes are for making soaps and for enriching land. The soluble salts of potash are dissolved out from them, and oil or fatty matters added to the alkali, to produce the soap. The residue is a valuable manure, but evidently inferior to the ashes before the potash was extracted. Pot and pearl ashes are the salts of potash extracted from wood ashes. The name potash is traced to the method of its preparation from the extract of the ashes boiled down in iron pots. Barilla, or soda ash, is a similar product of sea plants, soda replacing the potash. It was formerly largely imported into this country, but is now excluded by cheaper preparations of soda direct from sea salt. Ashes are sometimes used with lime and sand to increase the strength of mortar, and prevent its cracking. —Bone ashes contain much phosphate of lime, the cause of the fertilizing properties of bones. Phosphoric acid and phosphorus are prepared from these ashes. They are also used to make the cupels in which argentiferous lead is melted and oxidized for obtaining the pure silver. The cupels are merely bone ashes made into a paste with water, or beer and water, and then moulded and dried. —In distilleries, ashes find an extensive use for the rectification of the alcoholic liquors, the alkaline matters neutralizing any acids that may be present, and thus preventing their volatilization. It is a common impression that their great consumption in American distilleries is to give strength to the liquors after their dilution with water, and this is confirmed by the violent caustic quality, not unlike that of the ley of ashes, for which much of the common whiskey of the country is remarkable. Ashes mixed with salt make a strong cement for iron pipes. Cracked pipes repaired with it bear as heavy pressure as new pipes. The cement sets on application of heat of 600°. —*Shower of Ashes*, a phenomenon

which frequently accompanies the eruption of a volcano. Quantities of matter resembling fine gray or black ashes are thrown aloft from the crater to prodigious heights, and borne by the winds to an astonishing distance. On the eruption of the volcano Tomboro, in the island of Sumbawa, east of Java, in the year 1815, a shower of ashes fell for 19 hours in succession. An English cruiser, 100 m. away from the island, was surrounded by the cloud, and received from it an addition to its freight of several tons' weight, and a Malayan ship was covered 3 feet deep. The ashes fell upon the islands of Amboyna and Banda, the latter 800 m. to the eastward, and this apparently in the face of the S. E. monsoon, which was then blowing, but really carried by a counter current, the existence of which in the higher regions of the atmosphere was then first established. A similar phenomenon was observed in the eruption, in January, 1835, of the volcano Coscuina, on the S. side of the gulf of Fonseca in Guatemala. Its ashes were carried to the eastward, over the current of the trade winds, and fell at Truxillo, on the shores of the gulf of Mexico. Ashes from Etna were deposited in Malta in 1829; and in A. D. 79 the cities of Herculaneum and Pompeii, which had 16 years before been visited by an earthquake, were buried beneath the showers which fell from the neighboring volcano of Vesuvius. Volcanic ash is a mechanical mixture of minerals and rocks absorbed by trituration against each other, and consequently exhibits great difference of structure and composition. Not being a product of combustion, it can hardly be called a true ash.

ASHFORD, a town of Kent, England, 45 m. S. E. of London; pop. 5,500. It has damask manufactories, and the population is rapidly increasing in consequence of the favorable situation of the town at the junction of three railroad lines.

ASHLAND. I. A N. E. county of Ohio; area, 340 sq. m.; pop. in 1870, 21,933. It is crossed by the Ohio and Pennsylvania and the Pittsburgh, Fort Wayne, and Chicago railroads. Its surface is hilly and undulating, and the soil is of unsurpassed fertility. In 1870 the county produced 467,684 bushels of wheat, 537,798 of Indian corn, 551,245 of oats, 117,416 of potatoes, 33,674 tons of hay, 344,187 lbs. of wool, 668,473 of butter, 418,011 of cheese, 733,855 of flax, and 110,742 of maple sugar. Capital, Ashland. II. A new N. W. county of Wisconsin, bounded N. by Lake Superior, and separated on the N. E. from Michigan by the Montreal river; area, about 1,500 sq. m.; pop. in 1870, 221. The county is drained in its southern portion by affluents of the Chippewa river. Iron ore is found in a ridge called Iron mountain, which is 1,200 feet high.

ASHLEY, a S. E. county of Arkansas, bordering on Louisiana, bounded W. by the Sabine and Washita rivers, and intersected in the west by Bayou Bartholomew; area, 870 sq. m.; pop.

in 1870, 8,042, of whom 3,764 were colored. The surface is undulating and highly fertile. In 1870 the county produced 201,905 bushels of Indian corn, 34,269 of sweet potatoes, and 7,856 bales of cotton. Capital, Fountain Hill.

ASHMOLE, *Elias*, an English antiquary, founder of the Ashmolean museum at Oxford, born in Lichfield, May 23, 1617, died in London, May 18, 1692. He was a chancery solicitor. In the civil war he quitted London and settled at Oxford, adopted the royalist cause and became captain in Lord Ashley's regiment of horse, and after the battle of Worcester withdrew to Cheshire. On the restoration Charles II. bestowed upon him the offices of Windsor herald, commissioner of excise, and secretary of Surinam, with other appointments. He was for a time the intimate associate of the astrologers and alchemists Lilly, Booker, Sir Jonas Moore, and Wharton, and in 1650 translated and published Dr. Dee's *Fasciculus Chymicus* and *Arcanum* (on the Hermetic philosophy, &c.). He compiled a collection of the various unpublished writers on chemistry, which in 1652 he published under the title of *Theatrum Chymicum Britannicum*. In 1658 he announced that he had abandoned astrology and alchemy in his "Way to Bliss," a treatise on the philosopher's stone. In 1650 he had made a catalogue of the coins in the Bodleian library, and in 1659 obtained from the younger Tradescant the museum of coins and curiosities which he and his father had collected at their house in Lambeth. In 1672 he presented to the king a history of the order of the garter, for which he received a grant of £400. He was also the author of "History and Antiquities of Berkshire," and of an autobiography. In 1679 his chambers in the Temple were burned, and the greater part of his library, with 9,000 ancient and modern coins, destroyed. The rest of his valuable collection of coins was presented to the university of Oxford, which prepared a suitable building for them in 1682. His books were transferred to the same institution according to his will.

ASHMUN, *Jehudi*, agent of the American colonization society, born in Champlain, N. Y., in April, 1794, died in New Haven, Conn., Aug. 25, 1828. He graduated at Burlington college in 1816, and after preparing for the ministry was chosen a professor in the theological seminary at Bangor. Removing soon after to the District of Columbia, he engaged in the service of the colonization society, at first as editor of a monthly journal, but sailed for Africa, June 19, 1822, to take charge of a reënförceement for the colony of Liberia. Upon his arrival he found himself called upon to act as the supreme head of a small and disorganized community surrounded by enemies. In a short time he reanimated the spirit of the colonists, and restored their discipline. Three months after his arrival, by the aid of some fortifications he had constructed, and his own extraordinary bravery and conduct, they re-

ASHES—BOL.

pelled a surprise from a party of 800 savages, and defeated them entirely a few days later. When obliged by ill health to abandon the country, March 26, 1828, he left a community of 1,200 freemen.

ASHTABULA, a N. E. county of Ohio, bordering on Lake Erie and Pennsylvania; area, 420 sq. m.; pop. in 1870, 32,517. The surface is level, the soil clayey and adapted to grazing purposes. It is drained by Grand and Conneaut rivers, and traversed by two railroads. In 1870 the county produced 190,191 bushels of wheat, 557,632 of oats, 382,556 of Indian corn, 363,957 of potatoes, 58,678 tons of hay, 197,464 lbs. of wool, 1,134,877 of butter, 1,193,089 of cheese, and 146,306 of maple sugar. Capital, Jefferson.

ASHTON-UNDER-LYNE, a manufacturing town and parish of Lancashire, England, on the Tame, 6 m. E. S. E. of Manchester; pop. in 1871, 32,030. The extensive factories for cotton spinning and weaving, calico printing, and other branches of the manufacture of cotton goods, employ more than 15,000 hands.

ASHTORETH (plur. *Ashtaroth*; called by the Babylonians Mylitta, by the Assyrians Ishtar, and by the Greeks Astarte, and nearly identical with the Egyptian Athor or Hathor), the great female deity of the ancient Semitic nations on both sides of the Euphrates, and chiefly of Phœnicia. By Ashtoreth was originally meant the moon—"the queen of heaven"—and subsequently the planet Venus. Under her name is supposed to have been worshipped the principle of conception and production, in contradistinction to that of generation, variously represented by Baal, Belus, or Jupiter. According to many critics, she is identical with the Asherah of the Scriptures, the divinity of happiness. In Phœnicia she was at first represented by a white conical stone; afterward with the head of a bull or a cow; and ultimately as a human being with a thunderbolt in one hand and a sceptre in the other. Ashtoreth was sometimes worshipped in groves, sometimes in temples. Cakes made in the shape of a crescent, and male kids, are said to have been the offerings in which she most delighted. Eunuchs dressed in feminine attire, or women, were her favorite priests; and many of the rites in which they indulged at her altars were of the most lascivious character. The dove, the crab, and the lion among animals, and the pomegranate among fruits, were sacred to Ashtoreth. Statues and groves consecrated to her were very numerous in Syria. In Bashan a town of Og was named from her worship, Ashtaroth Karnaim (horned Astartes). The idolatry of Ashtoreth was introduced into Israel in the days of the judges, and was not finally extirpated till the reign of Josiah.

ASH WEDNESDAY, the first day of Lent, called by the fathers of the church *caput jejunii*, the beginning of the fast, or *dies cinerum*, ash day, in allusion to the custom of sprinkling the head with ashes. In the Roman

Catholic church, on this day the priest marks the sign of the cross with ashes on the foreheads of the people, repeating the words, *Memento, homo, quod pulvis es, et in pulverem reverteris*: "Remember, man, that thou art dust, and unto dust shalt return."

ASIA, the largest of the recognized continental divisions of the globe. The name, which was originally used in a much more limited sense than at present, comes to us from the Greeks, though believed by many to be of Semitic origin; its import is still a matter of question. The estimates of the area of Asia differ very considerably. That of Élisée Reclus gives the extent of the continents as follows, in square miles: Asia, 16,771,879; America, 14,902,989; Africa, 11,244,958; Europe, 3,822,320; Australia, 2,972,916; total, 49,725,062. Thus, considering Australia a continent, Asia comprehends almost exactly one third of the solid land of the globe, exclusive of the great groups of islands called Micronesia, Melanesia, and Polynesia. In this estimate the Japanese islands are regarded as belonging to Asia, although separated from the continent by considerable channels. Asia, thus considered, is bounded by the Arctic ocean, the Pacific, the Indian ocean, the Red sea, the Mediterranean, the Archipelago, the Black and Caspian seas, and European Russia. On the extreme N. E. it is cut off from America only by the narrow Behring strait. Between Asia and Africa the only connection is the isthmus of Suez. The separation between Europe and Asia is rather geographical than physical or political, the low range of the Ural mountains, which for the greater part forms the nominal line, being little more than a watershed, and running almost midway through the Russian empire. Europe is physically a corner arbitrarily cut off from the northwest of the great Asian continent. The bulk of Asia forms a solid square lying between the Arctic circle and the tropic of Cancer, and lon. 65° and 120° E. Among the projections from this solid square on the west are the peninsulas of Asia Minor and Arabia; on the north, the Siberian capes; on the east, the N. E. extremity of Siberia, with its southern prolongation of Kamchatka and the peninsula of Corea; on the south, India and the Malay peninsula. Asia as a whole forms a great trapezium, its main axis running N. E. to S. W., chiefly through Siberia, the intersecting line passing N. and S., nearly on the meridian of 100°, from Siberia on the north, in lat. 78°, to the S. extremity of the Malay peninsula on the south, almost under the equator. Including the Japanese islands, and a few others which may be properly considered as belonging to the continent, Asia thus extends from lat. 78° N. to the equator; or, including the islands of Sumatra and Java, and some minor insular prolongations of the Malay peninsula, to lat. 10° S.; and from lon. 26° E. to 190° E., equivalent, counted in the other direction, to 170° W. Asia

thus includes every climate of the globe, and all varieties of soil and production. The coast is deeply indented on every side. On the west it is cut into by the Mediterranean and the Black sea; on the north by numerous bays and gulfs of the Arctic ocean; on the east by the Okhotsk sea, the sea of Japan, the Yellow sea, and the gulf of Tonquin; on the south by the gulfs of Tonquin and Siam, the bay of Bengal, and the Arabian sea, and its prolongation, the Persian gulf. Its entire coast line is somewhat more than 33,000 m.; Reclus puts it at 35,886 m.—The great mountain ranges, which contain many of the loftiest summits on the globe, are arranged in the form of knots, from the central point of which ranges radiate in various directions. There are four grand systems, the Altai, the Hindoo Koosh, the Himalaya, and the Armenian, which divide the whole continent into a series of plains and plateaus of greater or less elevation. The central point of the Altai group is in the geographical centre of the continent, about lat. 50° N., lon. 90° E. Half way across the continent its median line runs E. and W. upon the parallel of 50° N., splitting into various folds. It sends a branch S. W., which unites with the Belur Tagh and the Hindoo Koosh; and one N. E., which under the names of the Yablonnoi and Stanovoi runs to the Arctic ocean. The Altai range separates the great northern plain of Siberia from the steppes of Mongolia and Mantchooria. The centre of the Hindoo Koosh range lies in about lat. 35° N., lon. 73° E. It branches eastward, under the names of the Kuen-lun and Karakorum, into Chinese Tartary, and westward to the S. shore of the Caspian, where the range receives the name of Elburz and approaches the Armenian group. The Hindoo Koosh, with its prolongations, separates the great desert of Gobi from China and Thibet, and divides the steppes of Turkistan from the plateau of Iran. The Himalaya, from the extreme western point, where the Indus cuts through it, to the eastern extremity, where the hills fail altogether on the right bank of the Brahmapootra, measures 2,000 m. in length, with an average breadth of 180 m. The western Himalaya, around the valley of Cashmere, has no peaks exceeding 16,000 or 18,000 ft. in height. In the middle of the range rise the stupendous peaks of Gaurisankar or Mt. Everest, 29,002 ft. above the level of the sea, Dhawalagiri, 26,826 ft., and Kinchinjunga, 28,156 ft. Aconcagua in Chili, now held to be the highest peak of the Andes, is 22,422 ft.; its head is therefore a mile and a quarter below that of Mt. Everest. Northward, under the name of Belur Tagh, the Himalaya range is continued between Independent and Chinese Tartary, where it is joined by the Thianshan mountains, which stretch into the desert of Gobi and the upland plains of Mongolia, and here and there connect with the Altai system. The eastern extremity of the Himalaya is connected with at least five chains,

which radiate fanwise, traversing parts of China and Further India. The Armenian group, of which Ararat is the culminating point, lies in parallel folds at the head of the peninsula of Asia Minor, between the Caspian, the Black sea, and the Mediterranean. It connects N. with the Caucasus, a somewhat isolated chain between the Caspian and Black seas, and in the west forms the Taurus; of its southern branches, the one, Libanus, follows the course of the Mediterranean; the other, running southeastwardly, forms the eastern boundary of the Mesopotamian plain. Besides these main groups are many ranges which claim mention. Among these are the Chang-pe Shan, a coast chain of Mantchooria; the Khingan Oola, on the E. border of the desert of Gobi; the Peling, Nan-ling, Yun-ling, and Yun-nan in China proper; and the Vindhya and Eastern and Western Ghats in Hindostan. In S. W. Asia there is the chain of the Arabian peninsula, joining on to Libanus. A notable chain branches off in the far northeast, near the arctic circle, traverses the coast of the peninsula of Kamtchatka, and disappears under the ocean, its summits appearing in the Kurile, Japanese, and Loo Choo islands. It forms the ocean rampart of the continent, enclosing between it and the mainland the seas of Okhotsk and Japan.—Apart from the mountain ranges Asia may be considered as consisting of two vast upland plateaus and six great lowland plains. The eastern plateau is a tract nearly as large as the whole of Europe, including the table land of Thibet and the desert of Gobi, extending N. to the Altai, and S. E. to the gulf of Tonquin. It is separated from Hindostan by the Himalaya range, some of the passes through which are higher than the loftiest peaks of the Alps. Cultivation is here carried on as high as 10,000 ft., and pasturage is found 2,000 ft. higher. On the southeast this table land is bounded by the Yun-nan and other almost unknown alpine ranges of China. On the north it is separated by the Altai mountains from the great plain of Siberia. The western plateau, or Iranian table land, has a general elevation of about 5,000 ft., rising sometimes to 7,000, or sinking to 2,000 or 1,200. It may be divided into three parts: Iran proper or Persia, Armenia, with Azerbaijan and Kurdistan, and Asia Minor. Persia has a mean elevation of 3,000 ft. A large part of its surface consists of salt plains covered with sand and gravel. In the Armenian division, the table land is compressed to half its more eastern width. Asia Minor, the western division, is bounded along the shores of the Black sea by wooded mountains which rise to the height of 6,000 or 7,000 ft. These sections present many diversities of soil and scenery. A considerable part of Persia is barren and arid, but interspersed with beautiful valleys. The coasts of the Persian gulf are generally sandy and sterile. A large portion of Khorasan and the adjoining regions is a desert of

clayey soil, impregnated with salt and nitre, varied here and there with patches of verdure. Beloochistan is mostly an arid plain covered with coarse red sand. The mountainous region of Armenia, extending toward the Black sea, abounds in fertile valleys set among rugged hills. There are several smaller and detached plateaus. Imbedded in the Ural mountains is a large plain rich in minerals. The highlands of Syria rise gradually from the neighboring deserts to an elevation of above 10,000 ft., and slope by a succession of terraces down to the narrow coast plain of Palestine, with a deep depression, the valley of the Dead sea, 1,300 ft. below the level of the ocean. In India the plateau of the Deccan rises to the height of 1,500 or 2,000 ft., shut off by the Western Ghats from the level coast of Malabar, by the Eastern Ghats from that of Coromandel, and by the Vindhya and Malwa mountains from the low plains of Hindostan. There are six great Asian lowlands: 1. That of Siberia on the north, which stretches from the northern declivities of the Altai mountains to the shores of the Arctic ocean. It is mostly cold, barren, and gloomy, hardly fitted for the abode of man. 2. The lowland near the Caspian sea and the Aral, a sterile waste, much of it lying below the level of the ocean. 3. The Syro-Arabian lowland, the southern and western parts a desert, with few green spots. But wherever there is water this lowland is wonderfully productive. Its N. E. section, lying between the Euphrates and the Tigris, known formerly as Mesopotamia and Babylonia, once supported powerful nations. Though now sterile and almost uninhabited, it needs only the restoration of the ancient system of irrigation from the two great rivers to render it one of the most productive regions of the earth. 4. The lowlands of Hindostan, comprising the great Indian desert, in the northwest, together with the fertile plains of Bengal, a region not exceeded even by China for capacity to support a dense population. 5. The Indo-Chinese lowlands, comprising the long levels of Burmah, watered by the Irrawaddy, and the low alluvial regions of Cambodia and Siam. 6. The immense Chinese lowlands, commencing in lat. 40° N., and spreading southward to the tropic of Cancer. This plain, containing an area of about 200,000 sq. m., nearly that of France, supports a population of more than 100,000,000, in proportion double that of England, more by half than that of Belgium, and much more than twice that of any other country in the world, except a portion of India.—The hydrography of Asia is regulated by its mountain ranges. There are six main river systems: 1. That of Siberia comprises the Obi, the Yenisei, and the Lena, each, roughly speaking, about 2,500 m. long. These carry off the waters of the Altai chain into the Arctic ocean. The Obi, the most western of the great Siberian rivers, is formed by two rivers

rising in the Altai range. In lat. 61°, a little N. of the parallel of St. Petersburg, it receives its great affluent the Irtysh, and the stream falls into the Arctic ocean in lat. 67°. The double basin of the Obi occupies a third of the area of Siberia. The Yenisei drains an area of about 800,000 sq. m., receiving in its course many large branches. It debouches in lat. 72° into the gulf of Yenisei. The Lena, draining about 700,000 sq. m., rises in the mountains N. of Lake Baikal, runs N. E. for half its course to Yakutsk, receives in lat. 63° the Aldan, its greatest tributary, and thence runs between masses of frozen mud, in which are found the remains of extinct species of the elephant and rhinoceros, falling into the ocean near lat. 78°, nearer to the pole than the mouth of any other great river. The Obi is the only Siberian river navigable for any distance; but, like all the others, it is frozen over for a great part of the year. 2. The Chinese river system comprises four minor divisions. The Hong-kiang or Si-kiang, rising in the province of Yun-nan, after an E. S. E. course of 1,000 m., falls into the bay of Canton. The Yang-tse-kiang descends in several streams from the Pe-ling mountains, which divide China proper from Tartary. Its length is nearly 3,000 m., a fifth part of which is navigable for large ships. In volume of water it is exceeded only by the Amazon and the Mississippi. It divides China proper into two nearly equal parts, passing through the most populous provinces. Its course is very winding, the general direction being first southeasterly and then northeasterly. It falls into the Yellow sea in lat. 32° N. The Hoang-ho or Yellow river, 2,500 m. long, has its source near that of the Yang-tse-kiang, but for a long distance the rivers are separated by mountain chains which border the table land. They then approach, and in 1851 their mouths were only 100 m. apart. In that year the Hoang-ho burst through its northern banks, and in 1853 its lower course had wholly changed, its present mouth in the gulf of Pechili-li being 260 m. N. of the former one. Nine similar changes are recorded within 2,500 years, the various mouths ranging over a coast line of nearly 850 m. Nearly all of the Chinese rivers are tributaries of these two great streams, the principal exceptions being the Hong-kiang and the Pei-ho or White river, which have their own basins. The Pei-ho, rising near the great wall, becomes navigable a few miles E. of Peking, and is an important channel for trade. It is also connected with the great canal. The Amoor, having its source in Mongolia, for a great part of its course separates Chinese Manchoooria from the Russian Amoor Country. Its lower course is wholly within the Russian dominions. Its length measured along its windings is nearly 2,400 m., or about 1,600 in a direct line. It falls into the sea of Okhotsk, in lat. 53°. 3. Of the Indo-Chinese system, the principal rivers are the Irrawaddy and the Salween, which water Burmah; the

Menam, which traverses Siam; and the Mekong, or Cambodia, which flows through Anam. These rivers traverse regions little known. 4. The Brahmapootra and the Ganges form a double system. The Brahmapootra, according to the still doubtful assumption which makes the Dzang-botziu its upper course, rises in the lofty table land of Thibet, its head waters being not far from those of the Indus. After watering the long valley of Thibet, it makes a sudden bend to the south, cuts through the Himalaya chain near its E. end, and falls into the bay of Bengal, its waters near the mouth sometimes interlocking with those of the Ganges. The latter rises on the southern side of the Himalaya, and after running S. E. through the plains of Bengal, and receiving in its course 12 large rivers, falls into the bay of Bengal. The Brahmapootra and the Ganges drain an area of about 500,000 sq. m., and there is scarcely a spot in Bengal more than 20 m. distant from one of their tributary streams, navigable even in the dry season. 5. The Indus rises near the head waters of the Dzang-botziu, but breaks through the Himalayan chain toward the N. W. end, and after a course of 1,800 m. falls into the Arabian sea, on the opposite side of the peninsula of Hindostan. It drains about 350,000 sq. m. 6. The Euphrates and the Tigris, rising in the mountains of Armenia, flow for some distance close to each other, but after descending into the plain diverge to a distance of more than 100 m., again approach, and finally unite, falling into the Persian gulf under the name of the Shat-el-Arab. The region between them is the Mesopotamia of the ancients. The length of the Euphrates is about 1,800 m.; that of the Tigris, which pursues a more direct course, about 1,150. The basin of the Euphrates and Tigris occupies about 250,000 sq. m.—The lakes of Asia are of less importance than those of America or Africa. The Caspian and the Aral, however, commonly called seas, may more properly be regarded as lakes. The former, 700 m. long and 200 broad, lies 83½ ft. below the level of the Black sea. Although it receives the waters of the Volga, the largest river of Europe, it has no outlet, and its waters are salt. The Aral, 300 m. long and at its centre 150 broad, lies about 40 ft. above the same level; its waters are salt, but less so than those of the Caspian. It is probable that these two lakes were once united. Lake Baikal, in S. Siberia, has an area of about 13,000 sq. m., being, next after Superior, Michigan, and Huron, the largest body of fresh water on the globe, and lies about 1,400 ft. above the ocean level. Lake Balkash, or Tenghiz, 250 m. long and 70 broad, has an area of upward of 8,000 sq. m., approaching that of Erie. China has six considerable lakes, of which the two largest, Po-yang and Thung-thing, have each an area of about 3,000 sq. m., a third of that of Erie. The Tengrinorin in Thibet is of about the same dimensions. In Turkish Armenia

is the great salt lake of Van. In Persia are the large salt lake of Urumiah, the small fresh-water lake of Hamun, and the little salt lake of Bakhtegan. Lake Asphaltitea, or the Dead sea, in Palestine, is notable for its great depression and the exceeding saltiness of its waters.—The proportion of Asia practically uninhabitable, either on account of extreme cold or the absence of water, is very great. A considerable part of Siberia lies north of the zone of cultivation. The great sand plain of Gobi, larger than France and England, is practically a desert. E. of the Caspian lies the large sandy desert of Khiva in Turkistan; and a still larger one occupies the centre of Iran. The great peninsula of Arabia is mainly a desert, which stretches northward and includes a considerable part of the plain of the Euphrates, having altogether an area of nearly 1,000,000 sq. m. Between the plains of Hindostan and the left bank of the Indus lies the Indian desert, 400 m. broad. Probably fully a quarter of Asia may be considered a desert region.—The climate of Asia embraces every general variety and every local incident: the rainless and riverless plains of Gobi, and the superabundant moisture of the Indian seacoast; the extremes of heat and cold in Siberia and the steppes; the more equable and agreeable climate of Asia Minor; gradations of temperature indicated both by a latitude ranging from the equator almost to the pole, and by a range of elevation from several hundred feet below the level of the sea to 29,000 feet above it. In no part of the earth's surface are the modifications of temperature, and consequently of products, more strongly marked; while in some spots the inhabitants behold at one view in their valleys and hillsides the animal and vegetable life of the tropics, of the temperate, and of the frigid zone. The vast plains of Siberia are exposed to the extremes of temperature. In Tobolsk the thermometer for weeks during the summer remains at from 80° to 90°, while the mean winter temperature is below zero. At Yakutsk the mean annual temperature is 13·43°, while in the summer it rises to 80°. The reason for this extreme variation is the distance of these plains from the ocean. The veil of mist which in more equable climates moderates the intensity of the rays of the summer sun is wanting; while in the winter no breeze laden with moisture is present to temper the extreme cold natural to the high latitude. The prevalent winds are from the southwest. These reach eastern Siberia after having traversed wide stretches of land covered with ice and snow, and being thus deprived of their caloric and moisture, they become cold land winds. This applies to the whole of Asia N. of lat. 35°. Compared with the maritime portions of Europe, the difference is striking. In Peking, lat. 39° 54', the mean annual temperature is 9° lower than at Naples, which lies a little to the north; and 4·5° lower than at Copenhagen, which is 17° nearer the pole. The rain-

less plain of Gobi, just N. of and considerably less elevated than Thibet, is exposed to such extremes of temperature that only the hardiest shrubs can exist. The western plateau is also excessively cold in winter and excessively hot in summer. In northern India the great differences in elevation occasion great variations of climate within very moderate distances. Over an immense region one may pass in a single day through all the range of climates; torrid at the foot of the mountains, temperate on their sides, arctic at the top. In southern India regular rainy and dry seasons, occasioned by the monsoons, greatly modify the climate. The direction of the prevailing winds also affects the temperature. On the southern declivity of the Himalayas, in lat. $30^{\circ} 45'$, the snow line begins at the elevation of 12,982 ft.; on the northern declivity the warm winds from the Thibetan plateau raise the snow line to 16,630 ft.—Asia is rich in minerals. Gold is widely diffused in the Ural and Altai mountains, China, Persia, and Japan; silver in Siberia, Cochin China, and India; copper and iron in very many localities; mercury in China, Japan, and India. The island of Banca vies with Cornwall in the production of tin. Coal has been found in northern China and Japan; the area of its production is not ascertained. Petroleum, in its various forms, is abundant in parts of China and India, in Siam and the valley of the Euphrates, and on the shores of the Caspian. Salt is common all over the continent. Precious stones are more widely diffused in Asia than in any other part of the globe, every-variety being found. The mines of India have produced nearly all the great diamonds discovered. The most valuable pearls are those found on the coasts of Ceylon and of the Persian gulf.—The geological features of Asia are considered under the special heads of the different countries and mountain ranges. The continent presents fewer traces than any other of volcanic action. Volcanoes are confined mainly to the peninsula of Kamtchatka, many of the mountains of which are only masses of lava. The peninsula of Cutch and the delta of the Indus present here and there traces of volcanic action, and are often agitated by subterranean forces. Mt. Ararat is also a volcanic peak. But the long line of islands forming a prolongation of the Asiatic continent is the great volcanic region; and the Japanese islands are also volcanic. The broken isthmus which connects the Indo-Chinese peninsula with Australia is a great line of fire. From Papua to Sumatra every large island is pierced with one or more volcanic outlets. Java has the largest number.—The flora of Asia, while in general similar to that of the other continents in corresponding latitudes, yet presents some peculiarities. Asia is especially the land of spices, odoriferous gums, and medicinal plants. North of the 60th parallel, the ground is perpetually frozen at a very small depth below the surface. Here and

there trees are found as high as 70° ; but for the most part the soil is covered with snow and ice for nine or ten months of the year. When this melts the plains are clothed with mosses and lichens, mixed with dwarf willows, and the swamps and morasses with coarse grass, sedges, and rushes. In the far north the plants live between the air and the earth, their tops scarcely rising above the soil, while their roots creep upon the very surface. The few woody plants trail along the ground, rarely rising an inch or two above it. The *salix lanata*, the giant of these miniature forests, never grows more than 5 inches high, while its stem, 10 or 12 feet long, lies hidden among the protecting moss. Somewhat further south, a beautiful flora makes its appearance in the brief hot summer. Potentillas, gentians, saxifrages, ranunculi, artemisias, and many others spring up, blossom, ripen their seed, and die in a few weeks. The Siberian steppes are bounded on the south by forests of pine, birch, and willow. The upper courses of the great rivers are bordered with poplars, elms, and maples. The Siberian pine, with edible seeds, reaches the height of 126 feet; the *pinus cembra* grows around Lake Baikal almost up to the line of perpetual snow. The greater part of Thibet is sterile. Frost begins early in September and continues till May. In some parts snow falls every month of the year. There are, however, many sheltered spots, heated by radiation from the bare mountain flanks, where grains and fruits of every kind flourish. Wheat, barley, buckwheat, and rice are native; maize has been introduced, and is successfully cultivated. There are olives, pears, apples, peaches, apricots, grapes, mulberries, and currants; the various species of melons are noteworthy for their quality and quantity. The Himalayan mountains form a distinct botanical district. Immediately below the snow line the vegetation is of an arctic character; lower down there are forests of pine, oak, walnut, and maple; the flowers are mainly species of rhododendron. At an altitude of about 5,000 feet the transition from a temperate to a tropical flora takes place. The transition zone lies between the 35th and 27th parallels of N. latitude, where the tropical flora becomes mixed with that of the temperate zone. The prevailing plants on the Chinese low grounds are glycine, hydrangea, camphor, laurel, the wax tree, clerodendron, rose of China, *thuja*, and *olea fragrans*, the flowers of which are used to flavor the finest teas. The India pride, paper mulberry, and other plants cover many of the hills. Of the tea plant there are two main species. The one, bearing small leaves, furnishes the tea consumed at home and exported to Europe and America; the other, with larger leaves, furnishes the brick tea consumed mainly in Thibet and N. E. Siberia; as used it is mixed with butter, forming a soup rather than a beverage. Rice is here the most important cereal. The plains of Hindostan are so completely sheltered

from the cold northern winds, and heated and watered by the monsoons, that the vegetation early assumes a tropical character. In the jungles among the lower ridges of the Himalaya ferns and orchidaceous plants abound. Trees of the fig tribe are a special characteristic. Some, as the banian, throw off shoots from their branches, which take root on reaching the ground, and become independent trunks, sending off other branches, which also take root, until a forest is formed around the parent stem. Palms of many kinds abound in India; of some species every part is useful to man. Cotton is of spontaneous growth. The native fruits of India are numerous. The orange, the plantain, the banana, the mango, and the date, areca, palmyra, and cocoanut palms, are all of Indian origin. The flowers are notable for their brilliancy of color. The island of Ceylon, which may be regarded as the southern extremity of the Indian peninsula, is the home of those species of laurel of which the bark constitutes cinnamon and cassia. The flora of Arabia is peculiar, being chiefly marked by the number of the plants producing odoriferous and medicinal gums. Oceans of barren sand, dotted here and there, wherever water is found, with oases, like islands, cover a great part of Arabia and the adjacent Syria. The prevalent vegetation consists of grasses growing under the shade of the date palms; while plants of the acacia tribe spring up scantily in the arid sand. Coffee, originally brought from Abyssinia to Arabia, has thence been widely diffused; the production in Arabia is small compared with the whole amount. The chief features of the Asiatic flora, excluding the arctic regions, may be thus summed up: The principal forest trees are aloes, bamboo, birch, chestnut, cypress, ebony, fir, gutta percha, ironwood, larch, mangrove, maple, myrtle, oak, palm, pine, poplar, rosewood, sandalwood, teak, and willow. The fruits are almond, apple, apricot, banana, banian, betel, cashew, citron, cocoa, date, fig, grape, guana, guava, lemon, lime, mangosteen, mulberry, olive, orange, pandanus, peach, pear, plantain, plum, pomegranate, shaddock, tamarind, and walnut. The most important spices and condiments are camphor, cassia, cinnamon, clove, mace, and nutmeg. The tea and coffee plants furnish the bulk of the non-alcoholic beverages of the world. The leguminous plants, such as the bean, pea, and lentil, present a great variety of species. The yam supplies the place of the potato. Cereals are widely diffused in their proper localities. Tobacco has been introduced, and is extensively cultivated. The sugar cane is indigenous. Hemp and flax are produced in large quantities. Among the native drugs are aloes, anise, camphor, datura, jalap, myrrh, opium, and sarsaparilla.—The zoölogy of Asia covers a wide field. It includes the whole class of domesticated animals. The ass, camel, goat, hog, horse, and ox came from Asia. Of the deer

tribe there are many species, from the antelope to the reindeer. The Asiatic elephant differs considerably from its African congener. Besides some special anatomical peculiarities, it is distinguished by the smaller size of the ears and tusks, the latter being often entirely wanting. In Africa the elephant has probably never been domesticated; in Asia it has from time immemorial been made the servant of man in peace and war. Of oxen there are at least four distinct species: the Indian ox (*bos indicus*), remarkable for its large hump, and held sacred by the Hindoos; the yak (*bos grunniens*) of central Asia, used as a beast of burden rather than of draught, notable for its silky tail; the buffalo (*bos bubalus*), often found wild, but capable of domestication; and the gayal (*bos garcaus*) of Indo-China. Among goats, that of Cashmere is famous for its silky hair, from which the costly shawls improperly styled camel's hair are made. Persia has a peculiar variety of sheep with a fatty tail. Many varieties of dogs exist; among the nobler species are the mastiff of Thibet, used for carrying burdens, and the Persian greyhound. Generally the dog is accounted an unclean animal, but a small species is fattened for food in China, the hams being considered a great delicacy. In India the pariah dog is the principal scavenger. Of the greater carnivora, the lion, leopard, and tiger are the chief. The Asiatic lion is smaller than the African, and lacks the flowing mane which forms the striking feature of the male of the African species. A species of leopard, the cheetah, has been partially tamed, and is used in hunting. The tiger is peculiar to Asia, abounding in the warm plains of the south and east, never crossing the deserts which separate India from Persia, but sometimes straying as far north as Siberia. Wolves and foxes are numerous in the colder, hyænas and jackals in the warmer regions. There are numerous species of bears; those of the cold regions are large and ferocious; those of the warmer parts are small and inoffensive, living mainly upon insects, fruits, and honey. Among about 422 species of quadrupeds found in Asia, 288 are stated to be peculiar to that continent. The tropical portions abound in monkeys, of which the species are numerous; some have long tails, some short ones, others none at all; but none have the prehensile tails of some American species. The birds of Asia include eagles, vultures, and falcons, of the predatory orders, with nearly all the varieties of game and domestic fowls, except the turkey. Lizards and other saurian reptiles are numerous in the rivers of the warmer parts of the continent; the gaval is the largest of its species. Pythons and other large serpents are found in the jungles. Of the larger venomous serpents, the cobra de capello is the most dreaded. Of fishes, the *salmonide* are abundant in the northern rivers, constituting the chief food of the natives and their train dogs. The

gold fish is a native of China. Of molluscan animals, the pearl oyster claims special notice, found chiefly in the Persian gulf and on the coasts of Ceylon.—Russian Asia includes the whole of the continent north of about 50°, with considerable southern extensions in the extreme east and in the west, reaching beyond 89°, the chief of which is a strip between the Black sea and the Caspian, including Caucasia and some territory acquired from Persia. Russia is slowly extending her domination among the independent tribes toward India, which it threatens to reach at no very distant date. Chiefly between lat. 50° and 40° lie Turkistan, Mongolia, and Mantchouria, inhabited by tribes which are more or less independent. Chiefly between lat. 40° and 30° lie Turkey, Persia, Afghanistan, and Thibet, with China at the east, extending southward to a little below 20°, and the main Japanese islands. Between lat. 30° and 20° lie Arabia, extending southward beyond 13°, southern Persia, Beloochistan, and the northern portions of Hindostan and Further India. South of lat. 20° are the main parts of the Indian peninsulas, the eastern including Burmah, Siam, and Anam, with the Malay peninsula, reaching southward almost to the equator.—The population of Asia is estimated at about 790,000,000, or nearly three fifths of the entire inhabitants of the globe. It is very unequally distributed over the continent. China proper and British India, with an area of less than 2,500,000 sq. m., have upward of 500,000,000; while Siberia, with about 5,000,000 sq. m., has less than 4,000,000. At least half the population of the globe is concentrated in China and India. Ethnologists usually group the inhabitants of Asia into three great classes: 1. The Mongolian race embraces almost all the peoples of the north, east, and southeast, including Siberia, Tartary, China, Thibet, and the Indo-Chinese peninsula, besides the dominant people of Turkey. But while the physical characteristics of the Chinese are similar to those of the Tartars, so great is the distinction between their languages that many have considered them as of a wholly distinct race. 2. The Aryan race embraces the main populations of Hindostan, Afghanistan, Beloochistan, Persia, and Caucasia, besides Russians, Greeks, Armenians, and others in Siberia, Turkey, and elsewhere. 3. The Semitic race includes the Syrians and Arabians, besides Jews in various parts. The Malay race appears on the continent only in the peninsula of Malacca. (See ETHNOLOGY.) Only a small part of the inhabitants of Asia can be properly designated as barbarous, for most of them have from time immemorial possessed a literature and established forms of government. Nor can they be called half civilized with much more propriety than the term might be applied to the ancient Egyptians, Assyrians, Greeks, and Romans. Their civilization, however, assumes a type presenting marked differences

from that of Europe and America. Up to a certain point, and in certain directions, the Asiatics made great advances in every department of thought and culture; but that point once reached, the progress of development was checked. In China the laws, literature, art, and industry have remained almost fixed for ages. So, too, although in a somewhat less degree, in India. The changes which have been wrought have sprung from without, from the pressure of foreign races or the influence of a new religion, rather than from a principle of growth from within. Their very languages show a lack of progressiveness. The Chinese language now is the Chinese of 2,000 years ago. The Arabic of the Koran is the Arabic of to-day.—The religions of Asia fall mainly within three great classes: Buddhism in China and Japan, respectively modified by and mingled with Confucianism and Sintoism; Brahminism in India; and Mohammedanism existing in almost every region, but especially in the Turkish dominions, Persia, and the smaller states of western Asia. The pagans on the one hand, and the Christians and Jews on the other, are too few to be taken into the general account. The Greek church may nominally number 7,500,000, the Roman Catholic 4,500,000, the Protestant 500,000. Religion seems to be almost the only changeable thing in Asia. In two centuries Buddhism became the predominant religion of 300,000,000 people; in half that time Islamism spread from Arabia to Persia, Hindostan, and Tartary; and within a few years Babism, a new religion, has sprung up in western Asia, and is rapidly spreading in Persia, Turkey, and India. (See BABISM.)—The political institutions of Asia present a variety of forms, among which the republican and constitutional are not to be found. Strict absolutism is the prevailing form. In many parts of Arabia and Tartary various nomadic tribes have a patriarchal government, under their own chiefs, although they nominally recognize a higher authority. In the true sense, only Turkey, Persia, Afghanistan, China, Japan, Burmah, Siam, and Anam can be called independent countries. All others are more or less dependent upon the great empires of Asia or Europe. In China the government is an absolute monarchy. More than a third of the continent is under the government of Russia and England. The most extraordinary foreign conquest is that by the British, which in a century and a quarter has made England mistress of more subjects than were ever ruled by any Roman emperor. Compared with the British possessions, those of the French in Cochin China and the Portuguese in India and at Macao in China are quite insignificant, while Holland and Spain possess only islands near the continent. Turkey should be considered an Asiatic power with possessions in Europe, rather than a European power with possessions in Asia. Great Britain, Russia, France, and Portugal

are therefore the only European powers who hold any portion of Asia. The principal political divisions of Asia may be classified as follows, placing the independent powers first in the order of their importance, and grouping some of the minor ones together: 1. China proper, with the islands of Formosa and Hainan. Chinese dependencies: Thibet, Chinese Tartary, Mongolia, Mantchooria, and Corea. 2. Turkey in Asia: Asia Minor, Turkish Armenia, Syria, Mesopotamia, Kurdistan, and part of Arabia. 3. Japan. 4. Persia. 5. Arabia. 6. Afghanistan, Herat, Beloochistan. 7. Further India: kingdoms of Anam, Burmah, and Siam. 8. Turkistan: khanates of Bokhara, Khiva, Kokan, and Koondooz. 9. Russian Asia: Siberia, Amoor Country, Russian Turkistan, Caucasia. 10. British India and native states under British influence. 11. French possessions: Cochin China, Pondicherry. 12. Portuguese possessions: Goa, Macao. Only roughly approximate statements of the area and population of most of these divisions can be given, for which reference is made to the separate articles upon them.—Asia is regarded as the birthplace of mankind. It is the cradle of all the great religious movements—of Hindoo pantheism and Buddhism, Hebrew monotheism and Persian dualism, Christianity and Mohammedanism—and the earliest seat of science and literature. Here flourished in hoary antiquity the secluded empire of China, and the Aryan communities which produced Zoroaster and the Vedas, and reared the stupendous monuments of Hindostan. Asia was the seat of the Assyrian, Chaldean, Median, Persian, Syrian, and Parthian empires. The names of Babylon and Nineveh, of Jerusalem, Sidon, Tyre, Palmyra, and Antioch, of Susa, Ecbatana, Persepolis, Ctesiphon, and Seleucia, of Sardis, Ephesus, and Miletus, keep before our minds the ancient glories of Asiatic power and culture; while in after ages Bagdad, Bassorah, Damascus, Aleppo, and even the distant Samarcand and Balkh in the wilds of central Asia, bespeak the progress of Asiatic civilization and intelligence. Phœnicia was the great teacher of Greece and the other countries bordering on the Mediterranean. When western civilization had been developed, Asia Minor was the theatre where Asia and Europe met. Persia and Hellas for a century and a half wrestled for supremacy, until semi-Hellenic Macedonia established her sway over both. The Seleucidæ of Syria became the successors of Alexander in the East, but finally yielded to the Parthians on one side and the Romans on the other. Rome extended her power to the Euphrates, and Asian Nicomedia was for a time a favorite seat of her emperors. In neighboring Nicæa Constantine had the dogmas of her new religion, received from Jerusalem, established. But Arabia produced a new faith and a new race of conquerors, and the caliphs triumphed over the Cæsars of the East, and restored power to its ancient seats

on the Euphrates, Tigris, and Orontes. Re-established Persia was merged in their dominions. Sultan Mahmoud of Ghuzni conquered Afghanistan, and carried Mohammedanism beyond the Indus. In the west of Asia the cross, about a century later, began a deadly struggle with the crescent, which lasted for ages, and terminated with the total discomfiture of the crusaders. Turkish tribes, Seljuks and others, had in the meanwhile become the chief rulers of Moslem Asia. But now a vast human flood, under Genghis Khan, surged in from the plains of eastern Asia, overwhelmed China, India, and western Asia, and rolled on as far as the centre of Europe, thus renewing the devastations of the Huns and other northern Asiatic tribes who desolated the West-Roman empire before its fall. The Mongols retired from Germany, but their yoke remained firmly fixed on Russia, where the Golden Horde held sway for more than 200 years. In Bagdad they terminated the dynasty of the Abbasside caliphs. At the same epoch they established the successors of Genghis Khan on the throne of Afghanistan and northern India, and thus gave rise to the great empire of which Delhi afterward became the capital. The great body of the Mongols themselves embraced Buddhism. The Mongols of India adopted Mohammedanism. By the same irruptive movement, the native dynasty of the Chinese was displaced, and a Mongol line of sovereigns set up in their stead, of whom Kublai Khan was the first and ablest. The conquests of these fierce tribes, which had penetrated from the Chinese wall to Silesia and the shores of the Mediterranean, induced a feeling of terror in Christendom. Attempts were made by missionaries, sent into the heart of Asia, to establish friendly relations with the Mongols. Marco Polo also travelled in central Asia and Mongolia, and, after residing for a period at the court of Kublai Khan, the conqueror of China, brought home admirable accounts of central Asia, China, and India. The vast Mongolian empire of Genghis had, after a few generations, crumbled into pieces. The tribes from whom the guards of the throne and persons of the caliphs had been chosen had assumed the position of independent conquerors, and had founded the Ottoman empire. In 1299 Othman led his followers into the ancient province of Bithynia, nearly opposite Constantinople, and made Brusa his capital. Amurath and his son Bajazet soon overran the provinces of Asia Minor, and crossing into Europe possessed themselves of the Byzantine provinces. A new invasion of the Mongols under Tamerlane now swept over Asia and overthrew Bajazet (1402), but Amurath II. restored the Ottoman power, and his successor Mohammed II. established himself in Constantinople (1453). Under Solymán the Magnificent (1520–'66), the Ottoman empire reached its present limits, comprising Asia Minor, Syria, the country as far as the Tigris, and a part of Arabia. A quarter of a century after the permanent establish-

ment of Mohammedanism in Constantinople, Bernardo Diaz doubled the Cape of Good Hope (1486). Two years later Vasco da Gama arrived at Calicut, and afterward Almeida and Albuquerque were sent out and formed Portuguese settlements, Goa being captured and made their capital (1510). At this period China was in the hands of a Chinese dynasty, which had been established in 1358 by the extirpation of the Tartar rulers. In central Asia the thrones of Samarcand, Ispahan, Afghanistan, and Khorasan were filled by descendants of Genghis or Tamerlane. A number of petty chiefs maintained their independence; and the Uzbecks, the successors to the country of the Turks, harassed all the territories within their reach. In Persia the first of the Sufi dynasty had just ascended the throne. Albuquerque directed a successful expedition against Malacca, where he received the submission of Pegu and Siam. He also seized Ormuz at the mouth of the Persian gulf. A Portuguese embassy was sent to China, and the Portuguese having gained the favor of the court of Peking by extirpating a band of pirates that infested the coast, permission was given them to settle at Macao. From this point and from Goa they directed their operations, and in 50 years were masters of the Spice Islands, and monopolized the whole trade of the eastern ocean. The subjugation of northern India by the emperor Baber in 1526, and a succession of able princes, consolidated the empire of the Moguls in India. Abbas the Great, shah of Persia (1587-1628), raised the Persian empire to its highest pitch of modern greatness.—The brilliant successes of the Portuguese in India inspired adventurers of other nations with hopes of wealth. But it was not till 1600 that the English East India company was formed, and in 1612 English factories were established by leave of the native authorities at Surat, Ahmedabad, Cambay, and Gogo. In 1644 the native dynasty of the Chinese was terminated by the rebellion of the mandarin Li-tse-ching, and the Manchoo Tartars again ruled the vast empire of China. About the same time the settlement of Madras was founded by the East India company, and subsequently the factory at Calcutta; and in 1661 the Portuguese ceded to the English the island of Bombay. The East India company, which had been unsuccessful as a trading undertaking, was reorganized, and in 1708 a new body of adventurers was formed, and admitted to a participation in its rights and privileges. This body was destined before the lapse of a century to acquire and consolidate a larger and more powerful empire than had ever been governed by the Moguls in India. Dutch and French trading companies had also obtained a footing in India. On the death of Aurungzebe in 1707, the affairs of the empire had rapidly fallen into confusion. The various rajahs became virtually independent, and the Mahrattas, who first appeared as freebooters during the reign of Aurungzebe, ex-

tended their dominions across the peninsula. In 1746, war having broken out between England and France, Labourdonnaie, the French governor of Mauritius, conducted an expedition against Madras, the chief British settlement in India, which capitulated on the understanding that it should be ransomed. Dupleix, governor of the French settlement of Pondicherry, conceived the scheme of consolidating the states of Hindostan into one mighty empire, and with the aid of native allies was at first successful against the English; but Clive saved the menaced existence of the East India company, and by 1760 the British had subdued the finest provinces of Bengal, Behar, and part of Orissa. From that time the limits of the British empire in India have steadily increased. A great revolt of the natives was put down in 1857-'8, and the government was immediately afterward transferred from the East India company directly to the crown.—In the north a few Cossacks brought Siberia under Russian dominion toward the close of the 16th century, and Peter the Great obtained a foothold in central Asia by assisting the shah of Persia against the Afghans. A plot concocted with Turkey for the dismemberment of the Persian kingdom was defeated by the energy of the usurper Nadir Shah, who for a brief space restored the waning glories of the Persian name, and passing the Indus pursued a career of conquest as far as Delhi. During his return he was murdered by mutineers (1747), and again the Persian empire was dismembered, Afghanistan being erected into an independent kingdom by Ahmed, one of Nadir's followers. The Russians have during the present century gradually extended their power, consolidating their rule over the Caucasian regions, and acquiring new possessions on the Aras, the Amoor, and the Jaxartes. Turkey has had conflicts with Russia, Persia, and her own vassal, Mehemet Ali of Egypt, but has escaped without a considerable loss of territory. Persia has been constantly declining, and has lately suffered a terrible depopulation from famine. China has seen foreign enemies in her capital, and half her territory ravaged by a powerful insurrection. Japan has been compelled to open her ports and cities to the abhorred occidentals. Afghanistan has been torn by foreign and domestic wars. Arabia has witnessed the overthrow of the Wahabites, and several minor conflicts, but is on the whole as isolated and unsubdued as ever. What was formerly Independent Tartary is now half reduced by Russia. The political influences of Asia are balanced by British supremacy in the south and Russian in the north. These two great powers have long antagonized each other at the court of Persia, the key to central Asia and northern India. In China, Russian influence is perhaps greater than that of any other nation. In the west, Turkey keeps up the appearance of a great power, but her influence in general Asiatic affairs is a cipher.

ASIAGO, a town of N. E. Italy, in the province and 17 m. N. of Vicenza; pop. 5,140. It has manufactories of straw hats. Asiago is the foremost among the "seven German communities" of Venetia.

ASIA MINOR, a peninsula at the western extremity of Asia, forming a large part of Asiatic Turkey, between lat. 36° and 42° N. and lon. 26° and 41° E., and bounded N. W. by the Dardanelles (the Hellespont of the ancients), N. by the sea of Marmora (Propontis), the Bosphorus, and the Black sea (Pontus Euxinus), E. by the Armenian mountains and their S. W. prolongations to the gulf of Iskanderun (of Issus), S. by the Mediterranean, and W. by the Archipelago (Ægean sea); area, about 212,000 sq. m. The eastern portion of the district consists of an elevated plateau from which rise mountain ranges of considerable height,

among them the Taurus and Antitaurus (see **TAURUS**), culminating in the extinct volcano of Arjish Dag (Argæus), about 18,000 ft. above the sea, and more than 9,000 above the plain. Between the abrupt edges of the high table land and the sea N. and S. of the peninsula intervenes only a narrow strip of low, level coast land. But on the west this strip is wider, forming an extensive and very fertile plain—that portion of the country to which the name of the Levant was several centuries ago first and properly applied, though the term has since been indefinitely used, often of the whole peninsula. The rivers are small; the chief are the Sakaria (Sangarius), Kizil Irmak (Halys), and Yeşil Irmak (Iris), which flow into the Black sea, and the Sarabat (Hermus) and Meinder (Meander), which empty into the Archipelago. On the bar-

ren plateau the climate is dry and very hot in summer, but in winter cold; the N. and S. coasts are less subject to extremes of temperature; while the coast plain has one of the pleasantest climates in the world. The fruits of the fertile strip of land along the coast were celebrated in ancient times, and are still the most important productions of the country. —During the earliest period of its history Asia Minor appears to have been inhabited by a number of different tribes, and even by entirely different races. The names of these tribes gave rise to most of the designations afterward given to the divisions of the peninsula. The boundaries of these were not well defined until, under the successors of Alexander, they became separate states, generally under the rule

of Macedonians and Greeks. The divisions on the N. coast were as follows: Bithynia, with the towns of Prusa (now Bursa), Nicomedia (Isnik), and Nicæa (Isnik), a country first inhabited by the Bebryces, a Mysian or Phrygian tribe, and afterward conquered by the Bithyni, who, according to Herodotus, came from Thrace; Paphlagonia, with its chief city Sinope (founded by a Greek colony), named from the Paphlagonians, from whom it was conquered by the Lydians, after which it was ruled successively by Persians, Macedonians, and Greeks; and finally Pontus, with Trapezus (Trebizond), first occupied by savage tribes of which little is known, then colonized by the Greeks, and afterward the kingdom of the famous Mithridates. On the W. coast

were three other divisions: Mysia, including the plain of Troy and the royal city of Pergamus, in the district of Teuthrania; Lydia (capital, Sardis), whose founders, the Lydians, were probably a Semitic people, who established the first enduring empire of which we have authentic record in Asia Minor; and Caria, settled, according to Herodotus, by colonists from the islands of the Ægean. On the W. coast also, and within the boundaries of the three divisions just named, were the famous Greek colonies of Æolia, lying principally in S. W. Mysia, Doris in southern Caria, and between the two Ionia, with its confederation of twelve cities (Phocæa, Smyrna, Ephesus, Miletus, &c.), peopled by Greek colonists, according to tradition emigrants from Attica in the obscure time of Codrus, who here maintained the reputation of their race for progress and civilization. On the S. coast were Lycia; Pamphylia, so called from the number of tribes composing its inhabitants (Πάμφυλοι, people of all races); Pisidia, parallel with and just N. of the narrow coast strip of Pamphylia; and Cilicia, with the city of Tarsus, in ancient times peopled by the most formidable pirates of the East. The inland districts were Phrygia, whose inhabitants claimed to be autochthonous; Galatia, named after the Gauls who deserted the army of the later Brennus to settle here; Cappadocia (capital, Mazaca, now Kaisariyeh), first ruled by the Medes, afterward by the Persians; Isauria, peopled by a tribe of mountaineers dreaded as daring robbers; and Lycæonia, first mentioned by Xenophon, and inhabited by an ancient tribe from whom it took its name.—In reviewing its history Asia Minor cannot be treated as a united whole; for details concerning its different divisions the titles just given are referred to. The following outline, however, may serve to show how inextricably its fortunes are complicated with those of the great nations which for 3,000 years contended for its dominion. Though the traditions regarding its first settlement are obscure, it appears that the Lydians, coming from the east, were among the first inhabitants of the country. Their government is at all events the first of which we have any detailed record. It flourished until King Cræsus was defeated by Cyrus, and the Persian empire gained the dominion of the peninsula, holding it from about 554 to 333 B. C. The campaign which in the last-mentioned year ended with the battle of Issus now added the country to the conquests of Alexander. It remained under his various successors until the victories of L. Scipio (190) and Manlius (189), followed by the treaty with Antiochus in 188, the bequest of the kingdom of Pergamus to Rome by Attalus III. (133), and the overthrow of Mithridates (65 B. C.) gave the territory to the Romans, in whose hands, and those of their followers of the Byzantine empire, it continued till its conquest by the Turks in the 13th century.—Asia Minor now forms a part of Turkey in Asia; its larger

portion constitutes the district called Anatolia, or Natolia, from the old Greek name given to Asia Minor—'Ανατολή, the east or land of the rising sun. Officially, it includes several eyalets, but the name Anatolia is generally applied to the whole region. For details as to its present condition, see **TURKEY**.

ASINAI, a tribe of Indians on Trinity river, Texas, frequently mentioned in accounts of La Salle's expedition and early Louisiana history under the name of Ceniz. They were a branch of the confederation known as the Texas, were sedentary, cultivating rudely maize, beans, squashes, melons, and tobacco, and making mats and earthenware. They lived in large beehive-shaped cabins, each holding 15 or 20 families, and at a very early day procured horses from the Spaniards to use in war and hunting. La Salle visited them in 1686, and the French subsequently, under La Harpe and St. Denis, tried to gain them; but the Spaniards established missions and posts among them in 1715. Before the close of the century they ceased to be noticed as a separate tribe, and are now apparently extinct, unless they are represented by the Arapahoes.

ASKEW, *Asceugh*, or *Aysceugh*, Anne, an English Protestant lady, a native of Lincolnshire, who was burned at Smithfield, July 16, 1546. Her husband, named Kyme, was a strong Catholic, and turned her out of doors because she embraced the principles of the reformers. She went to London to sue for a separation, and attracted the sympathy of the queen, Catharine Parr, and many of the court ladies. Her denial of the corporeal presence of Christ's body in the eucharist caused her arrest and committal to prison. Burnet says that after much pains she signed a recantation, but this did not save her. She was recommitted to Newgate, and asked to disclose who were her correspondents at court. She refused to reply, though she was racked in the presence of the lord chancellor. As she was not able to stand after the torture, she was carried in a chair to the stake, and suffered along with four others, undergoing this last trial with signal fortitude.

ASMANNSHAUSEN, a village of Prussia, province of Hesse-Nassau, on the right bank of the Rhine, 2 m. below Rüdesheim; pop. about 600. It is famous for the wine of Asmannshausen, one of the best red Rhenish wines.

ASMODEUS, or *Asmodi* (Heb. *Ashmedai*, from *shamad*, to destroy), an evil demon mentioned in the later Jewish writers. In the book of Tobit he is described as murdering the seven husbands of Sarah, one after the other. In consequence of this he has been facetiously termed the evil spirit of marriage, or the demon of divorce. In the Talmud he figures as the prince of demons, and is said to have driven Solomon out of his kingdom. Tobit got rid of him by prayer and fasting. Asmodeus is the hero of Le Sage's novel *Le diable boiteux*.

ASMONEANS, or *Hasmoneans* (Heb. *Hasmonaim*), the name of a Jewish priestly family

which, under its founder Mattathias, the great-grandson of Asmonæus, and his five sons, liberated Judea from the yoke of Antiochus Epiphanes and his successors, and subsequently held both the high-priestly and the princely dignity, until supplanted by Herod. They are also known, though not properly, as Maccabees. Mattathias raised the standard of revolt in 167 B. C., dying soon after. His fifth son Jonathan, and his grandson John Hyrcanus, fully established the independence of the country; and the son of the latter, Aristobulus I., assumed the royal title (106). The rivalry of Hyrcanus II. and his brother Aristobulus II., nephew of Aristobulus I., brought about the intervention of Rome, and the disguised subjection to her under Herod. Antigonus, the son of Aristobulus, who was the last to fight for the rights of his house, perished by the hand of the Romans (37), and Herod successively extirpated the rest of the house, including his own wife Mariamne and his two sons by her. (See HEBREWS.)

ASNIÈRES, a village of France, in the department of the Seine, on the railroad from Paris to St. Germain, nearly 4 m. N. W. of Paris; pop. in 1866, 5,455. The kings of France formerly had a castle here. The place, with its surroundings, was very conspicuous in the fights of the Paris communists with the government troops in the early days of April, 1871.

ASOPUS. I. A river of Bœotia, now called the Oropo. It rises about 6 m. N. of Mt. Elatea (anc. *Cithæron*), flows E. through Bœotia, and empties into the channel of Egeiro in the territory of Attica, near the town of Oropus; length about 25 m. II. A river of Peloponnesus, now called the Hagios Georgios (St. George). It flows from the mountains S. of Phlius N. E. through Argolis into the bay of Corinth. III. A river god, identified in legend with each of the above described rivers. The legends connecting him with the Asopus in Peloponnesus trace his descent from Neptune. He married Metopa, daughter of Ladon, and by her had two sons and twelve or twenty daughters. Jupiter bore off his daughter Ægina, whereupon Asopus revolted, but was struck by a thunderbolt and reduced to submission.

ASP, a name given to more than one species of the venomous serpents. By naturalists it is confined to the *vipera aspis* (Schl.), which is a native of the European Alps. The historical asp, with which Cleopatra is believed to have destroyed herself after the death of Antony, is generally supposed to have been the *cerastes Hasselquistii*. From many circumstances, however, and more especially from the description of Pliny, it is evident that the asp of the Roman writers generally, and therefore doubtless the asp of Cleopatra, is the common and celebrated Egyptian species, the *naja haje* of the modern Arabs. This reptile was chosen by the ancient Egyptians as the emblem of the good deity, Cneph, and as the mark of regal dignity. It is closely allied with the cobra de

capello, *naja tripudians*, called *ndg* by the Hindoos, which is still worshipped in some of the temples in India. The Hindoos believe

Asp.

that, in sagacity and its malicious tenacity in treasuring up a wrong to avenge it, this serpent is in no wise inferior to a man. The *naja* is of a dark greenish hue marked with brownish; is hooded like the cobra when it expands itself in rage, but wants the peculiar mark on the back of the neck which characterizes the Asiatic species, and which has been compared to a pair of spectacles. It varies in length from three to five feet, and is one of the deadliest serpents known. The bite produces acute local pain in the first instance; then a sense of deadly sickness; after which the sufferer falls into a comatose state, with convulsive fits, each less violent than the preceding one. In the last of these he dies, usually not many minutes after being struck. Owing to the almost instantaneous dispersion of the poison through the blood, it is not believed that excision could be of the slightest utility; nor is any certain antidote known against the deadly fluid when once in the veins.

ASPARAGUS, a genus of perennial plants, of the natural order *Liliaceæ* and the sub-order *asparageæ*, and differing only in the fruit from the *asphodeleæ*. The genus is distinguished by tuberous root stocks, branching stems, thread-like leaves, jointed pedicels, a 6-parted perianth, small greenish-yellow or white flowers, and a spherical berry. It embraces 26 species, many of which become hardy shrubs, and climb with their spiny branches as if by tendrils. A few of them are common in the East Indies and around the Mediterranean; most

Common Asparagus (*Asparagus officinalis*). Root, Fruit, Flower, Shoot, and Mature Sprig.

of them are rare and of little importance, and none are natives of America. Of the wild species, the most widely spread are the *A. acutifolius* and *albus*, the needle-leaved and the white, the former of which is common in France, Spain, Barbary, and the Levant; the latter is found in the same countries, France excepted, and is remarkable for its white flexuous boughs and green caducous leaves; the young shoots of both are eaten by the Arabs and Moors. The best known member of the genus is *A. officinalis*, the common or garden asparagus, esteemed as a delicate culinary herb from the time of the ancient Greeks. It is thought to be native both on the shores of England and in rocky and sterile districts in Europe and Asia, and when it has attained its full development is an elegant plant, from 3 to 4 feet high, with numerous branches loaded with fine and delicate leaves, and covered with small, greenish-yellow, bell-shaped, and almost solitary flowers. The young and tender shoots of the plant, cut when but a few inches from the ground, before ramification, are served for the table. It loves a dry, deep, and powerfully manured soil, and is raised from seeds either planted in seed beds in the spring and transplanted the next year, or planted at first where they are to remain. During the first two years the young heads should not be cut; half of them may be cut in the third, and after that the full crop. The supply will begin to diminish after 10 or 12 years. The beds for asparagus are usually about 4 feet broad, and should be manured and trenched at least 2½ feet deep. The plants are in rows about a foot apart, and are thinned out till they stand about 6 inches from each other in the row, and in growing a cluster of heads branch from each root. The crop may be reaped as often as it appears, being cut from a little below the surface of the ground; yet the plant degenerates by being cut late in the season. The bed should be annually, in the autumn, replenished with manure, dug in between the rows as deeply as possible without injuring the roots, and covered with pulverized manure, seaweed, or other litter during the winter, as a protection from the frost. Asparagus is easily forced by the use of hot-beds, but the process of transplanting always injures or destroys the roots; and if, instead of transplanting, the bed be covered and the trenches filled with hot dung, which mode is sufficient to forward the crop one or two weeks, care must be taken to give the plants time to rest and recover in the later part of the season.

ASPASIA, a Milesian woman who fixed her residence at Athens about the middle of the 5th century B. C. By her great eloquence, political and literary ability, and personal fascination, she at once obtained a commanding position among the leaders of the state, and gained the affection of Pericles so far that he separated himself from his wife and made Aspasia his consort as well in private life as in political affairs. The fact that the laws of

Athens conferred no rights upon foreign women, and allowed no actually legitimate marriage with them, has given rise to the impression that Aspasia was a courtesan. The many enemies of Pericles, especially the satirists of the time, also conveyed this idea by their attacks, but it seems to have been without foundation; she was held in universal esteem, and her union with Pericles was as close as the Athenian law allowed, and continued through his life. The enemies of Pericles attributed to her influence the outbreak of the war with Samos and of the Peloponnesian war; but the best historians deny this. She is also said with obvious exaggeration to have instructed Pericles in oratory; but it is certain that she assisted him greatly in the government, and that her own eloquence was remarkable. When the Athenians named Pericles the Olympian Zeus, Aspasia was called Hera (Juno). Her house was the resort of all the leading statesmen and philosophers of Athens; and in many of their works her great abilities are celebrated. After the death of Pericles (429) she attached herself to a cattle dealer named Lysicles, whom she instructed in oratory and by her influence raised in position. Her son by Pericles took his father's name, being legitimated by a popular decree, and became a general of high rank. He was put to death with five others in consequence of the unsuccessful result of the battle of Arginusæ (406).

ASPEN. See **POPLAR**.

ASPERN AND ESSLING, two villages lying about a league apart, on the N. side of the Danube, a short distance below Vienna, which were the principal strategic points in a desperate battle to which they have given a name, fought May 21 and 22, 1809, between Napoleon's army and the Austrians under the archduke Charles. The Austrians attacked while the two bodies of the French force were separated by the river, inflicting a severe defeat, and finally compelling Napoleon to retreat to the island of Lobau. Masséna, who secured the retreat by the defence of Essling, received from it his title of duke of Essling. The Austrian loss was 4,000 killed and 16,000 wounded; Napoleon's loss 8,000 killed and 80,000 wounded. Marshal Lannes was among the mortally wounded. The success of the Austrians was more than counterbalanced soon after by their defeat at Wagram (July 5, 6).

ASPHALTITES LACUS. See **DEAD SEA**.

ASPHALTUM, or **Asphalt** (Gr. ἀσφαλτός), a mixture of different hydrocarbons, some of which contain oxygen, by the majority of chemists and geologists supposed to be of vegetable origin, while others derive it from the remains of animals. It is also called bitumen, mineral pitch, and Jews' pitch (from Lacus Asphaltites). (See **BITUMEN**.) It is more bituminous than the coals, and when pure is of the consistence of resin; but the consistence varies with the temperature and with the amount of liquid bitumen or petroleum which may be mixed with it, holding the more solid asphaltum in solution. It

is often intermixed with stony substances, and sometimes even contains 80 per cent. of carbonate of lime. Pure asphaltum is soluble in oil of turpentine, naphtha, and carbonates of the alkalis, but insoluble in water; alcohol dissolves out of it about 5 per cent. of a resinous substance, and ether takes up 20 per cent. of another resin that is not affected by the alcohol. It yields also a volatile oil. The remainder is a substance named by M. Boussingault *asphaltene*, the composition of which is $C_{20}H_{16}O_8$. Asphaltum burns readily, with a red smoky flame, and leaves no ashes except those due to its impurities. Its specific gravity ranges from 1 to 1.8; its color is black and dark brown, and it does not soil the fingers. It melts at the temperature of boiling water, and consequently is unfit for use as fuel, and cannot be economically used for gas. Most of the geological formations contain it, but it is particularly common in the secondary and tertiary calcareous and sandy strata. In the primary rocks it is found only in small veins. It is obtained in large quantities on the shores of the Dead sea, rising to the surface, where it forms solid lumps which are thrown on the shore. Some of the other noted localities are a lake on the island of Trinidad, $1\frac{1}{2}$ m. in circumference, which is hot at the centre, but is solid and cold toward the shores, and has its borders over a breadth of three fourths of a mile covered with the hardened pitch, with trees flourishing over it. The inhabitants powder the asphaltum and drive it by a blast upon burning coals; thus used it gives out as much heat as an equal weight of the best English coal. It is thrown over bagasse or wood fuel in the manufacture of sugar. At various places in South America are similar lakes, as at Caxatambo and Berengela, Peru, where it is used for pitching boats; in California, near the coast of Santa Barbara. It occurs in smaller quantities, disseminated through shale and sandstone rocks, and occasionally limestones, or collected in cavities or seams in these rocks, in Derbyshire, Cornwall, and the French department of Landes; and at Val de Travers, Neuchâtel, impregnating a bed in the cretaceous formation, and serving as a cement to the rock, which is used for buildings. Grahamite from West Virginia, described by Prof. Wurtz of New York in 1865, resembles asphaltum in its pitch-black lustrous appearance.—A rigorous analysis applicable to all asphaltum cannot be given, as each bed may present different results. The following ultimate analyses have been made:

	Carbon.	Hydrogen.	Oxygen.	Nitrogen.	Ash.
1. Bastennes,	75.50	8.90	2.60	1.65	8.45
2. Auvergne,	77.64	7.56	8.85	1.03	5.13
3. Cuba,	82.94	9.10	6.25	1.91	0.40

Nos. 1 and 2 were by Ebelman, No. 3 by Wetherill. The action of heat, alcohol, ether, naphtha, and oil of turpentine, as well as the above analyses, show that the so-called asphaltum from different localities is very various in composition, and that the true composi-

tion of any one of them is not known. They contain volatile oils, heavy oils, resins soluble in alcohol, solids soluble in ether but not in alcohol, other solids not soluble either in alcohol or ether, and nitrogenous substances.—Asphaltum was used by the ancient Egyptians in embalming, and appears to have been employed in the construction of the walls of Babylon. It is now used for pavement, for making water-tight tanks, as a coating for tubes of glass and iron used for conveying gas or water, and for various other purposes of like nature. Asphalt is used in Paris in two different forms: first, the natural rock, unalloyed, with which streets are paved; second, a mixture of asphalt with bitumen and fine gravel for the construction of sidewalks. The rock is found principally at Seyssel and Val de Travers, and is transported to Paris by canal and rail. Pure asphaltic rock is preferred for streets and roads. When this is heated to near 800° F., it crumbles to a mass of brown powder, which when compressed in a mould and allowed to cool recovers its original hardness and appearance. If the hot powder, instead of being placed in a mould, be spread about two inches thick on a hard foundation and pressed or packed by a hot iron pestle or roller and allowed to cool, the surface will immediately solidify, forming a crust identical with the original rock. The discovery of this application was due to accident. Fragments of asphaltum, dropping from the carts which transported it from the quarries along the road, became heated by the sun and were crushed to powder and compacted by the continual passage of carts, until they formed a hard, smooth track. The matter was investigated, and led to the present method of asphaltum road making. The sidewalks of Paris are made of mastic of asphaltum, with an addition of bitumen and fine gravel, and can be more properly described under PAVEMENT.—**Artificial Asphaltum** is made from bitumen or the refuse tar of the gas house. Coal tar is heated to a degree that renders it hard and brittle; of this 25 parts are mixed with 50 parts slaked lime in fine powder and 75 parts river gravel. These ingredients are thoroughly incorporated in a cast-iron boiler, heated for two hours, and drawn off into moulds. The blocks thus obtained are treated subsequently like mastic of asphalt for sidewalks, except that the temperature is carried higher. Another patent gives the following proportions: Residue of tar containing considerable non-volatile oil, 25 to 50 per cent.; carbonate of lime in dry powder, 50 per cent.; silica and clay, 25 per cent. This is stirred in a boiler over a slow fire for ten hours and run off into moulds. The mineral constituents must be previously strongly heated to expel air and moisture, in order to facilitate the thorough incorporation with the pitch. Artificial asphaltum is used for coating gas pipes to protect them from corrosion; also for sidewalks, roofing, flooring, especially for

stables, and water-tight tanks. A concrete prepared of 95 lbs. asphaltum, 5 lbs. bitumen, and 150 lbs. broken stone, has been employed in France for marine constructions. The use of prepared asphaltum in the United States has been largely increased since the discovery of petroleum and of a deposit of a solid hydrocarbon called Grahamite, and also in consequence of the great extension of gas manufacture by which the supply of raw material has become practically inexhaustible.

ASPHODEL (*asphodelus*), a genus of ornamental perennial plants belonging to the natural order *liliaceæ*, and to the sub-order *asphodeleæ*. They are all natives of the old world, and are found abundantly in Greece, Sicily, Asia, and Barbary. The genus comprises 12 species, all of which have a bulbous root, erect undivided stem, long leaves, and showy flowers arranged in clusters, which in most of the species are spikes. The *luteus*, or common yellow species, is an old inhabitant of European gardens, into which it was introduced from the shores of the Mediterranean. It is branchless, about 2½ feet high, has scattered and almost pili-form leaves sheathing the stalk, and flowers of a beautiful golden yellow. It blossoms during six weeks in mid-summer. The *ramosus*, or white and branched asphodel, has a naked stem with ramifications near the summit, each of which is terminated by a spike of white star-shaped flowers having their petals streaked with purple. The ancients had a superstition that the manes of the dead

Asphodelus ramosus.

were nourished upon its roots, and they therefore planted it in the neighborhood of sepulchres, and made it sacred to Proserpine. It still covers the hills and valleys of Apulia, where it furnishes nourishment to the sheep. The *albus*, or upright asphodel, differs from the preceding by having a branchless stem, and also by having its flowers a little smaller and nearer together. The other species of asphodel are much less frequently cultivated in gardens.

ASPHYXIA (Gr. *ἀσφύξια*, from *ἀ* privative and *σφύξις*, pulse), literally, a temporary or a final suspension of the motion of the heart, and the pulsation of the arteries. The word is now used exclusively to signify a condition of imperfect or suspended respiration, in which the blood is no longer arterialized by the influence of the air, irrespective of the motion of the heart, which may continue some time

after respiration ceases. The immediate baneful effects of the suspension of respiration arise from the privation of oxygen, and from the retention of the carbonic acid previously formed, which becomes a blood poison. If the circulation be disproportionately augmented, carbonic acid is formed, and being morbidly retained, convulsion and death ensue. If the respiration is unduly and disproportionately augmented, the subject is cooled, for mere pulmonary respiration is a cooling process, by the difference of temperature of the inspired and expired air; and in this case also the subject dies, but now from loss of temperature. This latter is the case in the asphyxiated patient, if the respiratory movements be unduly hastened. On the other hand, if in the asphyxiated we excite the circulation, without simultaneously and proportionately inducing the respiratory movements, we destroy the patient by carbonic acid, formed in the course of that circulation, and uneliminated by respiration. This statement explains the injurious and fatal tendency of the warm bath which was formerly recommended in asphyxia, for it is injurious, and has doubtless of itself proved fatal in cases in which the patient without it would have spontaneously recovered.

ASPINWALL, or *Colea*, a city and seaport of the United States of Colombia, the Atlantic terminus of the Panama railway, situated on the island of Manzanilla in Limon or Navy bay, in lat. 9° 21' 28" N., lon. 79° 53' 52" W., 47 m. by rail N. N. W. of Panama; pop. in 1872, about 6,500. The island of Manzanilla (area, 650 acres) was in 1852 ceded to the railway company for ever. The harbor of Aspinwall is one of the best on the coast. The town was founded by the railway company in 1850, and was originally intended to serve merely as a port of transit; but it has become a centre of supply for many neighboring towns. The office and freight depot of the railway company, the former of brick and the latter a massive stone structure 800 by 80 ft., are the only edifices worthy of note. The railway company's wharf, 40 ft. wide, extends out from the shore upon a coral reef nearly 1,000 ft. The former insalubrity of the place has been in great part remedied by raising its level and by thorough drainage. The port is now (1872) visited monthly by three steamers from New York, four from English, two from German, and two from French ports.

ASPLAND, Robert, an English dissenting minister, born in Cambridgeshire, Jan. 28, 1782, died Dec. 30, 1845. In 1799 he entered the university of Aberdeen, but in the following year he resigned his scholarship on account of the change in his theological opinions, which prevented him from remaining longer a beneficiary upon a Calvinistic endowment. For a year or two he tried to occupy himself with trade, but he soon resumed his theological pursuits, and in 1801 was ordained pastor of the General Baptist congregation at Newport, Isle of Wight, with liberty to preach Unitarian

doctrines. He was then not 20 years old. In 1805 he was installed pastor of the Gravel Pit chapel, Hackney, where he continued until his death. Mr. Aspland stood for years at the head of the active Unitarian clergy of England. In 1806 he established a religious magazine, the "Monthly Repository," and took the lead in founding the Unitarian fund society for the support of popular preaching and the relief of indigent ministers. In 1815 he established the "Christian Reformer," a monthly magazine of considerable influence. The list of his publications numbers 50, and since his death a volume of sermons and several pamphlets from his pen have been edited by his son.

ASPRONONTE, a mountain in the S. W. corner of Italy, near Reggio, celebrated for the battle of Aug. 28, 1862, between the Italian troops under Pallavicini and the volunteers of Garibaldi. The latter, who had crossed over from Sicily to march on Rome, against the warnings of the royal government, was defeated, wounded in the foot, and taken prisoner with the larger portion of his men.

ASPROTAMO. See **ACHELOUS**.

ASS (*equus asinus*), the humblest member of the horse family, known to be of eastern origin. He is first mentioned in Genesis, in the history of Abraham, who, when he went down to Egypt on account of the famine in Palestine, found that Pharaoh was possessed of "sheep, and oxen, and he asses, and man servants, and maid servants, and she asses, and camels." At that time, probably, as was the case during all the historic ages of Greece, a species of ass was wild on the mountains of Syria, Asia Minor, and throughout Persia; and in the latter country and Armenia, in the region about the sources of the Tigris and the Euphrates, and the shores of Lake Van, it exists in a state of nature to the present day. Asses are mentioned in Xenophon's Anabasis as occurring in great numbers in parts of Mesopotamia. These animals, which he simply terms wild asses (*δρακὶ δρυπιοι*, of which words the specific Latin name *onager* is merely a corruption), were in company with ostriches, antelopes, and bustards; they were eagerly pursued by the horsemen of the army, and are described as being possessed of extraordinary speed and endurance. The wild asses of the same country are still possessed of the same characteristics. They have always been the special quarry of the Persian monarchs, and Nadir Shah was indefatigable in his pursuit of them, and considered the running down of one with his greyhound a feat equal to the winning of a battle or conquering a province. The flesh was considered the most exquisite of venison. The wild ass of Xenophon, and that, probably identical with it, hunted by the shahs of Persia, is presumably the dziggetai, or *equus hemionus* of Pallas, which, as its specific name (*hemionus*, half-ass) indicates, possesses as much of the horse as of the ass in its character and qualities. The best breed of ass comes from the

East, where he has been long carefully cultivated as a saddle animal. The rocky nature of the soil and mountainous face of the country in Palestine favored the employment of this

5

WILD Ass (Dziggetai).

hard-hoofed, sure-footed, patient, and enduring animal, as much as it discouraged that of the delicate, fine-limbed, high-bred courser of Syria and Arabia. Lieut. Col. Smith, who has devoted much attention to the equine families of the East, found near Bassorah a breed of white asses, remarkable for their excellence, which he had reason to believe are of a breed as ancient as the time of the kings of Judah.—The characteristics of the ass, as distinguishing him from the horse, are: 1, inferiority in size, although doubtless this in European countries is in great part in consequence of centuries of cruel treatment, scanty fare, and want

Ass (*Asinus vulgaris*).

of attention in breeding, the animal having been for ages regarded only as the drudge of the poor; 2, a rougher and more shaggy coat, capable, however, of much improvement by warm keeping and a little grooming; 3, the shortness and stiffness of his pastern joints, and the hard solidity of his sound upright hoofs, which seem almost incapable of lameness, and render him the safest and most sure-footed of animals in difficult mountain passes; 4, the extraordinary length of his ears, resembling those of the hare more than those of his own race; 5, the peculiar cross which he bears on his back, formed by a longitudinal dark stripe along the course of the spine, and a transverse bar across the shoulders, which in-

dicates his family connection with the untamable members of his race, the zebra and quagga, who are yet more conspicuously striped, and of whose character and disposition the ass possesses many points. The usual color of the ass is gray, mouse-colored, or black; and as he tends to bay, dun, or chestnut, the horse colors, the quality deteriorates. The dental system of the ass assimilates that of the horse, and in like manner indicates the age of the animal by the changes and marks of the teeth. The male ass is capable of propagation at two years, the female somewhat earlier; the latter carries her foal 11 months, producing it in the beginning of the 13th. The sexual vigor in both sexes is excessive, which may explain the fact that in the hybrids of the ass and horse the offspring are much nearer, as well in organization as in temper and appearance, to the former than to the latter progenitor. In all cases the mule is an ass modified by a strain of the horse; not a horse modified by a cross with the ass. The hybrid foal of the male ass and the mare is the true mule; that of the stallion and the she ass, the hinny—the latter being less strongly tinged with the blood and having less of the form of the ass, owing to the superior influence of the male in the physical form and external organization of the progeny. The mule, like the ass, brays, owing to a peculiar construction of the larynx; while the hinny neighs, like its sire.—There is no doubt but that with careful breeding, grooming, stabling, and nutritious feeding, the ass might be improved at least as much as any other domestic animal. As it is, he is admirably adapted for a beast of burden in cold, mountainous countries, in which, on a quarter of the food required by a horse, he will safely carry burdens under which the more generous animal would break down, over places in which the other could not keep its footing. Under kind treatment, he is hardly inferior in docility to the horse or the dog. The female is excessively fond of her young, and both sexes are susceptible of strong attachment to their owner. In elevated countries, where the soil is light, asses are serviceable in an agricultural point of view; although in the United States, to which they were first introduced by Gen. Washington, they are little used except for the propagation of mules. The best asses are obtained either from Smyrna, the island of Cyprus, or from Spain, where the race has been particularly cultivated, as it has also in Peru, with a view to the business of mule-raising, which in both these countries is important.

ASSAB, or **Saba**, a bay in the Red sea, on the coast of Africa, 40 m. N. W. of the strait of Bab-el-Mandeb, in lat. $12^{\circ} 55'$ N., lon. $42^{\circ} 45'$ E., 16 m. long and 5 m. wide. It is bordered on the W. by high table land, and in its front are the coral islands of Darmabah and Darmahis, the last forming near Cape Luma a safe harbor for small craft. The neighboring inhabitants are the Danakil, who are

virtually governed by their own sultan, though the khedive of Egypt claims to be their legitimate ruler. The bay of Assab was purchased in 1869 by an Italian steamboat company as a coaling station on the voyage from Italy to Egypt through the Suez canal to India.

ASSAM, a province at the N. E. extremity of British India, presidency of Bengal, between lat. $25^{\circ} 50'$ and $28^{\circ} 20'$ N., lon. $90^{\circ} 40'$ and $97^{\circ} 30'$ E., bounded N. by Bhotan and Thibet, N. E. by Thibet, E. and S. by Burmah, and S. W. by Bengal; area, 21,800 sq. m.; pop. variously estimated at from 200,000 to 700,000, the smaller number being probably more nearly correct. The country lies between two mountain ranges, branches of the Himalaya, which are joined at its eastern end, and rise both on its northern and southern side to the height of nearly 20,000 feet. These send out offshoots along the sides of the valley which forms the province, and which consists of a long and level plain, studded here and there with groups of hills. The number of considerable streams exceeds 60, so that Assam is supposed to contain more rivers than any other equal extent of territory in the world. The Brahmapootra is the chief of these, flowing through the centre of the country from E. to W. The soil is fertile, and the climate temperate and agreeable. A regular rainy season, like that of the tropics, lasts from March till October, swelling the rivers and flooding great districts of the plain, obliging the inhabitants to construct high causeways between the towns and villages. Earthquakes are frequent, but seldom severe. The country is rich in minerals, containing coal and petroleum, iron, and gold dust in some of the river sands. Tea, silk, sugar, tobacco, and ivory form leading articles of trade. The tea plant is indigenous here, and is largely cultivated under the auspices of the English "Assam Tea Company," more than 17,000 acres of tea plantations having been under cultivation within the last few years. Tigers, leopards, bears, deer, and other wild animals abound, and elephants are very numerous. The Assamese are akin to the Hindoo races. They are lithe and active, though generally slight in frame; they are almost beardless, and have unusually smooth skin. They live in huts of bamboo and mats, and lead rather indolent lives, carrying on few and unimportant industries. The most widespread religion is Brahminism, but there are also many Mohammedans. Assam was governed by a series of kings, concerning whose origin and reigns little is known, until the 17th century, when a formidable attempt was made by the Mogul emperors to attach it to their dominions. This was defeated; but from that time the country became the prey of revolutions, and gradually declined in power till 1770, when the British troops interfered in a revolution against the rajah, and occupied a portion of the territory. In 1826, in the war with Burmah, the British finally took possession of the country.

ASSASSINS (Arab. *Hashashin*, hashish smokers), a secret political society in Persia, Syria, and Arabia, in the middle ages, a branch of the Ismaelians, so called from the imam Ismael ben Jafar. It took its origin in Persia about A. D. 840 from Abdallah, son of Maimun Kadah, a believer in the ancient Magian worship, who undertook by the preaching of his *dais* or missionaries to reestablish the old religion, or at least to overthrow the power of the Abbasside caliphs. His followers were sometimes called Ibabié, "indifferents," and sometimes Ismaelians, because they favored the pretensions of the descendants of Mohammed ben Ismael, of the house of Ali. One of his disciples, Ahmed, called Karmath, raised the standard of revolt, and for a whole century the East was involved in wars. Another partisan of the sect, the dai Abdallah, who styled himself a descendant of Mohammed ben Ismael, escaped from prison, where he had been confined by the caliph Motadhad, and succeeded in seating himself on the throne of Africa under the name of Obeidallah Mahdi, A. D. 909. This person was the founder of the dynasty of the Egyptian caliphs, who, tracing their descent to Ismael ben Jafar Sadik, and from him to Fatima, the prophet's daughter, are known by the name of Fatimites or eastern Ismaelians. The secret policy of this sect was to overthrow the Abbasside caliphate. In the reign of Hakem-biamr-illah a lodge was instituted at Cairo called Dar el-Hikmet, house of wisdom. Access to this lodge, and the use of the books and mathematical instruments kept in it, as well as instruction by the professors, who were paid by the government, were free to all. In this lodge were taught nine secret doctrines deduced from those of Abdallah ben Maimun Kadah. In the first degree the mind of the novice was purposely perplexed, and a hidden meaning of the text of the Koran was suggested. After an oath of unconditional obedience the pupil was initiated into the second degree, which inculcated the recognition of divinely appointed imams, who were the source of all knowledge. The third degree taught their number, which could not exceed seven; these were Ali, Hassan, Hossein, Ali Seimolabidin, Mohammed el-Bakir, Jafar es-Sadik, and Ismael his son. The fourth grade taught that since the beginning of the world there have been seven divine lawgivers, or speaking apostles of God, each of whom had by command of heaven altered the doctrine of his predecessor. Each of these had seven coadjutors in succession, who, as they did not appear openly, were called *mutés* (*samit*). The first of the *mutés* was named Sus, and the seven speaking prophets were Adam, Noah, Abraham, Moses, Jesus, Mohammed, and Ismael ben Jafar. The fifth degree taught that each of the seven mute prophets had twelve apostles for the extension of the true faith, the number twelve being the most excellent after seven. After these five degrees the precepts

of Islamism were examined, and it was shown that all positive religious legislation must be subordinate to the general and philosophical. The dogmas of Plato, Aristotle, and Pythagoras were adduced as proofs and laid down as axioms. In the seventh the student passed from philosophy to mysticism. In the eighth the pupil was perfectly enlightened as to the superfluity of all prophets and apostles, the non-existence of heaven and hell, the indifference of all actions, for which there is neither punishment nor reward either in this world or the next; and thus was he matured for the ninth and last degree, in which he became the blind instrument of his superior. This lodge was closed by the general of the caliph Amer Biakim-illah, but was soon reopened.—One of the initiated *dais* was Hassan ben Sabah, who became the founder of the eastern branch of Ismaelians, the Assassins. Banished from Egypt, he went to Aleppo, Bagdad, and Persia, preaching his doctrine and making proselytes. Partly by stratagem and partly by force, he got possession of the almost impregnable castle of Alamut (eagle's nest) in the Persian province of Ghilan, strengthened it, and made it the seat of the central power of the Assassins. The basis of his political and religious system was: "Nothing is true, and everything is lawful." The knowledge of all the degrees was to be imparted only to a chosen few. The bulk of his followers were only initiated far enough to confuse their minds and leave them dependent upon their leaders, and the observance of all the precepts of Islamism was most strictly enjoined. At Alamut, and when their power was extended in other places also, the Assassins had splendid walled gardens with flower beds and fruit trees of every description, limpid streams, luxurious halls, and porcelain kiosks, adorned with Persian carpets and Grecian stuffs, drinking vessels of gold and silver and crystal, and charming maidens and handsome boys. A youth who was deemed worthy by his strength and resolution to be initiated, was invited to the table and conversation of the grand master; he was then intoxicated with hashish and carried into the garden, which on awakening he believed to be paradise. Sleeping again, he was carried back to the side of the master; and when the effect of the drug had passed away he believed that he had actually had a foretaste of the bliss of paradise, and henceforth blindly devoted himself to the will of his master, eagerly seeking an opportunity to sacrifice himself in order to attain eternal life. Later, when one of the grand masters allowed the enjoyment of every pleasure to all, the sect frequently intoxicated themselves with hashish, whence their name Hashashin, corrupted by the crusaders into Assassins, which, in view of their bloody deeds, came to signify men who practise secret murder in general. Jelal ed-Din Malek, sultan of the Seljuks, having sent an ambassador to the grand master to require his obedience and fealty, Hassan ben Sabah called into his presence

several of his followers. Beckoning to one of them, he said, "Kill thyself," and he instantly stabbed himself; to another, "Throw thyself from the rampart," and the next moment he lay a mutilated corpse in the moat. Then turning to the envoy, the grand master said, "Go tell thy lord, in this way I am obeyed by 70,000 faithful subjects." The grand master was called *seyed*, the lord, or more commonly *sheikh el-jebel*, chief of the mountain region (incorrectly translated old man of the mountain), because the order always maintained itself in castles among the mountains in Persia, Irak, and Syria. He never assumed the title of sultan or emir, and preached not in his own name, but in that of the invisible imam who was to appear at a future period. Immediately under the grand master were the *duah el-kibar*, grand recruiters or priors, his lieutenants in the three provinces to which his order extended. Under these were the *duah* or *dais*, the religious nuncios and political emissaries, the initiated masters. Then followed the *refika*, fellows, who were advancing to the mastership through the several grades of initiation into the secret doctrine. Next came the *sedavi*, the guards of the order, the warriors, and devoted murderers; then the *asasik* (aspirants), the novices; and finally the profane or the people. Hassan laid down for his dais seven rules of conduct: 1. The *ash-inai-risk* (knowledge of the calling) comprised the maxims for the judgment of character necessary in selecting subjects. 2. The *teenis* (gaining confidence) taught them to gain over candidates by flattering their inclinations and passions. 3. As soon as they were won, it was necessary to involve them by doubts and questions on the religious commands and absurdities of the Koran. 4. The *ahd*, or oath, bound the aspirant in the most solemn manner to inviolable silence and submission. 5. The candidates were taught how their doctrines agreed with those of the greatest men in church and state. 6. The *teasis* (confirmation) recapitulated all that preceded. 7. The *teensil* (allegorical instruction), in opposition to the *tensil* or literal sense of the divine word, was the principal essence of the secret doctrine, reserved only to a few of the initiated.—Hassan ben Sabah was speedily attacked by the sultan Malek, but he sustained himself, and even gained new strongholds. The practice of assassination by which he became the terror of eastern monarchs was first tried upon his early friend the grand vizier Nizam ul-Mulk. The death of the sultan, apparently by poison, soon followed, and then ensued a fearful series of murders and reprisals. Fakhr ul-Mulk Abul-Mosaffar, who had succeeded his father Nizam ul-Mulk as grand vizier, and another of the royal family, were assassinated. One of Sultan Sanjar's slaves, who had been won over to the Assassins, stuck a dagger into the ground near his master's head while the latter was asleep. Some days after the sultan received a letter from Alamut,

saying, "Had we not been well disposed toward the sultan, we might have plunged the dagger into his heart instead of the ground." Peace was then concluded between the parties, and many privileges were granted to the Assassins. Hassan ben Sabah survived all his nearest relations and most faithful disciples. He slew two of his sons without any apparent cause. He died in 1124, at the age of 90 years, and was succeeded by his general and chief dai, Kia Busurg-Omid, in whose time hostilities were renewed by Sultan Sanjar, and great numbers of the Assassins were put to death. The vizier of Damascus gave them the castle at Banias, near the source of the Jordan, which became the centre of their power in Syria. In 1118 Abul-Wefa, the prior there, entered into a treaty with Baldwin II., king of Jerusalem, by which he bound himself to put the city of Damascus into his power in return for the city of Tyre; but the plot was discovered by the sultan, and the greater part of the Assassins and the crusaders were attacked and cut to pieces. At Cairo the Fatimite caliph Abu Ali Mansour fell by the dagger of an Assassin, and shortly after (1185) the Abbasside caliph was assassinated at Bagdad. The Assassins now spread all over the western part of Asia, from the confines of Khorasan to the mountains of Syria, from the Caspian to the southern shores of the Mediterranean. In 1171 the last of the Fatimite dynasty died, and the lodge at Cairo was overthrown. Saladin, who became sultan of Egypt, proved a formidable enemy to the Assassins. In the month of Ramazan, 1163, Hassan II., the fourth grand master, summoned the inhabitants of the province to Alamut, where he addressed the multitude, announced the day of resurrection or revelation of the imam, and commanded them to break the fast and give themselves up to all kinds of pleasure. A similar proclamation was made throughout the country, and was received by a majority of the people with joy. In 1175 the Assassins made two futile attempts on Saladin's life, and he in return ravaged their territory, and only desisted from completely annihilating their power on condition of his being in the future safe from their daggers. About 1191 Conrad, lord of Tyre and marquis of Montfort, a near relation of Leopold, duke of Austria, was murdered by two Assassins, said to have been hired for that purpose by Richard I. of England; and it seems that the imprisonment of the latter by Leopold was in reprisal for the death of his kinsman. Hassan III. prohibited everything that his grandfather and father had allowed, and again enforced the observance of the precepts of Islamism; and no assassinations were committed in his reign. By this prudent conduct he acquired the good will of the Moslem princes, and received from the caliph of Bagdad the title of sovereign prince, a favor never granted to any of his predecessors. Under his successor, Aladin Mohammed, the use of the dagger was resumed. About 1252 Hulaku, monarch of the

Mongols, captured Roknedin, the last of the grand masters, in his castle of Maimundis. Roknedin and his whole race were condemned to massacre; 12,000 captives were assembled and slaughtered at once; troops went through the provinces to execute the sentence, and many of the castles were demolished. In 1270 Sultan Bibars overthrew their authority in Syria. For about a century longer the Ismaëlians were numerous in Persia, but with diminished power. Assassins are said to remain still in some parts of the Lebanon and Persia, but only as a heretical sect of Islamism, and they seem to have lost all remembrance of their former power and murderous tactics. Some of their doctrines and practices are also traced in those of the Druses. The Persian Ismaëlians consider their grand master as an incarnation of the Deity. A few years since the fact of the existence of the order in India, widely diffused, was disclosed through a suit brought in the English courts for the possession of its records by a person claiming to be grand master.

ASSAULT, any wilful and unlawful attempt or offer, with force or violence, to do a corporal hurt to another. In New York it has been added to a definition of substantially the same import, that the assault may consist of any act tending to such corporal injury, accompanied with such circumstances as denote at the time an intention coupled with the present ability of using actual violence against the person. But this illustration is not quite correct, for to cover the cases of pointing firearms, though they are not loaded, at persons, the ability to do the injury need not be actual, but it is sufficient if it be only apparent. Nor need there be an actual intention to do the violent act; for if the assaulter causes it to be believed that he has such an intent, though he has not in fact, the assault may be committed. There must be some exhibition or threatening appearance of force, and this must ordinarily be of physical force. A threat alone is not an assault; yet such threat, spoken under circumstances which of themselves, so to speak, import restraint or force, may constitute the offence. One who, having an open knife in his hand, and being within striking distance of another, demanded with threatening words the surrender of a certain paper, was held guilty of an assault. Force may be exhibited by the raising of the hand or a weapon as if to strike, or to hurl something; or by the pointing of a gun or pistol within the range of the arm, as if to shoot with it, and even though it is not loaded, if it is reasonably supposed to be loaded by the person assaulted; or by wilfully riding a horse so near a foot passenger, or driving or attempting to drive a carriage against the carriage of another, or even by driving it toward the other, so as in any of these cases to excite reasonable fear of injury; or by pursuing another with a dangerous weapon, and coming so near him that he may reasonably apprehend danger. But an assault may be

committed, even though the violent show of force is not actually within reaching distance, provided it be so near as to excite a fear of immediate harm in a person of fair firmness. Thus, where one was approaching another with clenched fist, as if to hit him, but was stopped by bystanders just before he got near enough to do so, he was held guilty of an assault. The force, and thus the assault, may exist to the eye of the law, even though it is not apparent on the face of the facts, and where from the submission or consent of the victim it seems that it could not have existed. This is illustrated by those cases in which schoolmasters or physicians have, by virtue of the authority or the trust reposed in them in these relations, induced young girls to submit to indecent maltreatment. In such cases the consent is regarded by the law as neither intelligent nor voluntary. Further, the force must be unlawful. Therefore it is not an assault when a father or a schoolmaster, for good reasons, chastises a child within proper limits. —Certain assaults are described as aggravated assaults. Such are assaults upon magistrates in courts of justice, or against other officers of the law. But it seems that to constitute such an offence, the person assaulted must be known to be such an official, or there must be grounds upon which it can fairly be presumed that he was known to be so. —Assault is a misdemeanor; that is to say, it is of an inferior degree of criminality, and is ordinarily punishable by fine or imprisonment, or by both. —Assault must be distinguished from battery. The words are commonly used together, for the reason that the two offences are usually committed together; but they are in fact distinct and separate. Battery is the actual infliction of the threatened violence. But the law will not permit even the threat of it, and therefore makes that a substantial offence, namely, an assault. (See BATTERY.)

ASSAYE, or *Assye*, a village of Hindostan, in the Nizam's dominions, 43 m. N. E. of Aurungabad, near which in September, 1803, the duke of Wellington (then Gen. Wellealey), with 2,000 British troops and 2,500 sepoy, defeated the much more numerous combined force of Scindia and the rajah of Nagpoor.

ASSAYING (old Fr. *assaier*, mod. Fr. *assayer*, to try), the chemical examination of an ore, a metal, or an alloy, to determine the proportions of its ingredients. The assay of a gold ore, to obtain the amount of gold present, consists of several operations. Fifty grammes of the ore are mixed with 80 grms. of oxide of lead, 20 of carbonate of soda, 4 of charcoal dust, and 12 of powdered glass. If the ore contains much silica, the glass may be left out; if much sulphur, 2 grms. of nails should be added. The mixture is placed in a Hessian sand crucible, covered by a layer of salt, and heated in a furnace for half an hour at a gentle heat, and then for half an hour at a white heat. When this crucible is taken out of the furnace and allowed

to cool and then broken open, a button or globule of lead will be found at the bottom, covered by a dark glassy slag and a layer of salt. This button contains the gold and most of the silver of the original 50 grms. of ore. The oxide of lead, the quartz, and carbonate of potash form a fusible glassy slag which absorbs earthy impurities. The oxide of lead and nitre unite to drive off the sulphur as sulphurous acid. The coal dust reduces a portion of oxide of lead to a fine spray of metallic lead, which in settling alloys the gold and silver, carrying them to the bottom of the crucible. The button usually contains, besides lead, gold, and silver, some copper, nickel, antimony, and sulphur, if these substances were present in the ore. The process of separating gold and silver from the other metals with which they are alloyed depends on the principle that they cannot be converted into oxides when heated in the air, while the other metals with which they are generally alloyed can be oxidized at a high temperature, especially when a large quantity of lead is present. The lead button is placed in an earthenware dish made of fire clay, called a scorifier (*scoria*, slag). A wind furnace containing a muffle is used for heating the assay in this and in the succeeding operation. The fuel generally employed is coke or anthracite; charcoal is sometimes used when the other cannot be obtained. The muffle is a flat-bottomed earthen vessel, 8 or 10 in. long, 3 or 4 in. wide, and 2½ or 3 in. high, its top arched over, one end open, the other closed; in fact it is half a cylinder open only at one end. In its roof and sides are little apertures through which the air drawn in at the open end can pass. It is set in the furnace, in the front of which is an opening corresponding to the open end of the muffle. Coals are heaped around and upon it to expose it to the full heat of the furnace. In the scorifier, when heated to a bright red heat, the so-called baser metals are oxidized and form a slag, leaving a small quantity of pure lead alloyed with silver and gold. This alloy while in the molten state is poured into a cooling mould, hammered to free it from slag, and is then ready for the next operation, which is called cupellation, and is performed in a little cup called a cupel. The cupels should be prepared of bone ashes well burnt, ground, and washed, and then shaped into cylindrical forms an inch or so high and 2 in. in diameter, their tops having a shallow depression to hold the metal. These cupels have the property of absorbing the oxides of metals and of holding those that will not oxidize; but as they cannot absorb a greater weight than their own of oxide of lead or litharge, not quite so much of this metal should be put into any one cupel as its own weight.—At the mints the assayer is mostly called upon to practise his art upon coin and bullion, alloys of copper, lead, gold, and silver, or containing two or more of these metals. In this case the previous operations of fusion in the crucible

and lagging in the scorifier are omitted, and the assay begins at this point. The alloy to be assayed is carefully weighed in a delicate balance. It may be from 2 or 3 grammes, or even less, if already considerably alloyed. A proper quantity of lead, known to contain no silver, is put with it, and the two are placed by means of small tongs in the cupel, which with the muffle has been brought to a full red heat in the furnace. It is convenient to carry on several of these operations at once, and therefore a number of the cupels are usually introduced together on the floor of the muffle. The metals when placed in the hot cupel immediately melt and form a bright globule, which spins around and keeps in continual motion. The air drawing in through the muffle oxidizes its surface, and fumes of the oxide of lead are carried off by the draft. At the same time a floating scum of the oxide is constantly flowing down the sides of the globule and sinking into the cupel, while freshly formed oxide replaces it. Any copper that is present is oxidized with the lead and absorbed into the cupel. Thus the operation goes on till it terminates by all the lead being oxidized, which is indicated by a sudden brightening up and subsequent darkening of the little globule, and the cessation of the appearance of the fumes and scum of oxide. This little globule, which is pure silver, pure gold, or an alloy of the two metals, shows by its weight the quantity that was in the sample. Care should be taken to avoid too intense heat, as this may volatilize a portion of the silver; and the globule should not be cooled suddenly, as the pure metal absorbs oxygen when melted, and gives it out in cooling. If the change is sudden, some silver is apt to be ejected with the gas. By a little experience and care this operation is made so perfect that no sensible difference should be detected in the weight of two buttons obtained from two assays of equal weights, when tested by a balance that turns with ⅕ of a milligramme. The quantity of lead that should be added is a matter that can only be determined by experience. Too little lead for the oxidation of impurities prevents the formation of a clean button of silver, free of oxide, and too much lead is apt to carry down with it into the cupel a small quantity of silver. This operation is often performed with the blowpipe, and small cupels adapted to its uses. The weight of the little button is ascertained by the size of the round hole, of a graduated series of such holes in a brass plate, which it fits, the weight of a button of silver or one of gold for each hole having been previously ascertained. In skilful hands this is conducted very expeditiously, and with considerable accuracy. It is especially adapted to the testing of argentiferous lead ores, to determine approximately their percentage in silver. The lead also may be quantitatively determined by the reducing process with the blowpipe, that must precede the cupelling. If the button

when taken from the cupel proves to be pure silver, it shows at once the value of the sample of ore or bullion; but if it contains gold, as in the gold assay, the amount of gold must be found out and subtracted from the weight of the button, and the amount of each metal will then be known. To this end the alloy of these metals is separated by the process called parting, or quartation, as it is usually conducted upon an alloy made to contain at least three parts of silver to one of gold. If the silver is in larger proportion, the gold cornet will crumble; but when of small amount compared with the gold, it is shielded by the gold from the action of the dilute nitric acid which is used to dissolve out the silver. To insure a perfect union of the gold and silver added to it, it is well to melt them with lead, and then separate the lead by cupelling. More heat may be safely applied than when silver is cupelled without gold, as the alloy of these cannot waste by volatilization. The button is hammered out, heated red-hot, and annealed, and then rolled into a thin plate, which is coiled up of the size of a quill, and called a cornet. This is put into a parting glass, and two or three times its weight of pure nitric acid is poured upon it. Some heat is applied, when red fumes of hyponitric acid are given off, and in a short time the silver is dissolved, and the gold is left, still retaining the form of the coil, but forming a brittle, spongy, brown mass. The solution of silver is poured off, and a strong acid is added to the gold, and heated to dissolve out the last traces of silver. This is poured off, and the gold is washed with hot distilled water. It is carefully taken out, put in a crucible, and heated, when it shrinks together and regains its metallic lustre and the fine color of gold, with its softness and flexibility. Being now weighed, the process is finished by the calculation of the quantity lost. The silver is recovered by precipitating it from the solution by the introduction of bright sheets of copper, for which metal the acid has a greater affinity than for the silver. It is ascertained that in this process the silver is never entirely taken up by the nitric acid, and that some gold is dissolved by the strong acid, as is found by preserving for years the same acid to extract the last traces of silver. The inside of the bottle containing it becomes at last coated with fine gold. This has been noticed in the British mint, and full 80 grains of gold have been collected from bottles thus used. Very small errors are thus involved in estimating the quantities of silver and gold by this process.—Assayers and metallurgists at the present time prefer what is termed the wet method, performed by the aid of acids and solutions, and called wet in contradistinction to the dry or furnace assay, for the determination of the amount of iron, zinc, copper, and antimony in the ores of these metals. The estimation of the amount of iron in an ore is performed by the aid of a solution of perman-

ganate of potassium. When a solution of this salt, which is of a beautiful violet color, is added to a solution of protoxide of iron, the protoxide is immediately converted into the peroxide, and the solution loses its color. If, however, the permanganate of potassium is added with constant stirring until all the protoxide is converted into peroxide, and one drop too much added, that one drop will color the whole iron solution very distinctly. It is found that the same amount of iron always requires the same amount of permanganate of potassium to give the first color. The permanganate of potassium is termed a standard solution. If then 0.2 grm. of iron is dissolved in acid (muriatic), and the standard solution added from a measuring tube, we can determine the amount of solution needed for 0.2 grm. iron; and when an ore is dissolved, and changed to protoxide by dissolving zinc in it, and the standard solution added, we obtain the amount of the solution needed for the amount of iron in the ore. And the problem is solved by this proportion: as first amount of standard is to second amount of standard, so is 0.2 grm. of iron to the amount of iron in the ore. The dry method of assaying iron ores is still used to assist the masters of iron furnaces in planning the proportions of ingredients to be used in the blast furnace for the production of iron. It is based upon the same principles as the reducing them in the blast furnace. The oxygen with which the metal is combined must be taken up by presenting to it some substance for which it has stronger attractions than for iron, and the earthy impurities must have such substances added to them that the product of their union will be a glassy fluid, through which the globules of metallic iron can easily sink and collect together in a button. Charcoal is the substance for deoxidizing the ore in the blast furnace and in the crucible. The matters for aiding the fusion, called the flux, vary according to the earthy ingredients of the ore. The desired glassy fluid is a silicate of lime and alumina, and it may be of magnesia. If the ores already contain much silica, carbonate of lime, with the addition of some alumina or common clay, constitutes the proper flux. Ores deficient in silica require an addition of it. Some ores contain such a mixture of proper fluxing ingredients, that they melt easily without any addition of these matters. In the crucible, a little borax increases very much the fusibility of the mixture. The ore and fluxes should be thoroughly ground and mixed together, and placed in a brasqued crucible, that is, one carefully filled and rammed with fine charcoal, moistened with water to a paste, and out of the top of which a cavity is excavated for holding the assay sample. The crucible is to be placed in a wind furnace, and gradually heated for half an hour, when the whole force of the blast is to be applied for half an hour longer. A button of cast iron will be found in the bottom of the crucible when it has cooled.—The wet as-

say of copper is performed by dissolving a weighed amount of ore in nitric acid, and removing sulphur if present by an addition of chlorate of potassium. Muriatic acid is added, and the nitric acid removed by evaporation. The residue is dissolved in water and muriatic acid and filtered; the copper is precipitated from this solution by pure zinc or iron, and the resulting copper sponge is washed by decanting the liquid and replacing it by distilled water, and then quickly dried and weighed as metallic copper; from this weight the value of the ore is easily calculated. The dry assay of copper is still in use in Cornwall, at Swansea, and at some other places. It is, as conducted by metallurgists, often an empirical process, the fluxes being added with very vague ideas as to their true effect. The ores are properly classified into those which contain no sulphur, arsenic, or any foreign metals but iron; those which contain sulphur, iron, arsenic, antimony, &c. Ores of the first class, containing over 3 per cent. of copper, are reduced in a crucible by the addition of three parts of black flux. Poorer ores may be assayed in the wet way. The second class are sulphates or sulphurets. The former are easily decomposed by heat in a platinum crucible, when they may be treated as substances of the first class. The sulphurets, under which general head are included most of the workable ores of commerce, are treated in a great variety of ways. The first operation, after reducing them to fine powder, is to roast or calcine them, to expel the sulphur. This process requires care and experience, and is most thoroughly effected, according to Mitchell, by adding one tenth of their weight of carbonate of ammonia to the roasting mass in the crucible, constantly stirring it in as the calcining goes on. Sulphate of copper is produced by the roasting; and on addition of carbonate of ammonia, by double decomposition, sulphate of ammonia forms, which being volatile can be expelled by heat. The ore is then thoroughly mixed in a mortar with 25 per cent. of its original weight of lime, and 10 to 20 per cent. of fine charcoal, and 1½ time its weight of dry carbonate of soda. The whole is to be placed in the same crucible in which the roasting was done, and covered with its weight of glass of borax. It is then subjected to a moderate heat for a quarter of an hour, and to a bright red heat as much longer. On cooling, and breaking the crucible, the button of copper will be found in the bottom. It is well to make two parallel assays of these ores, that one may confirm or disprove the other.—The varieties of lead ores which are most commonly subjected to assay are the sulphurets (galena) and the carbonates. The former is treated by taking 400 or 500 grains, coarsely powdered, and mixing with it one fourth its weight of black flux, one fourth of iron nails, and one eighth of cream of tartar. The crucible should be large enough to contain double the quantity, and the charge

should be covered with common salt half an inch deep. After being exposed to a high heat for ten minutes, the lead may be poured out, or suffered to cool in the crucible. If the ore contain much earthy or pyritous matter, a less proportion of iron filings should be used, and a little fluor spar and borax be added. Galena is conveniently assayed in an iron crucible, the crucible itself furnishing the material for desulphurizing the ore. The usual quantity, say 400 or 500 grains, is mixed with 2½ times its weight of carbonate of soda, and put in an iron crucible, which is covered. The galena is decomposed, and sulphuret of iron formed. The lead is poured out into an ingot mould, and the crucible well tapped to obtain all the lead. Another sample is immediately put in while the crucible is hot, and the operation repeated as long as the crucible lasts. The carbonates are assayed with half their weight of black flux, and a little cream of tartar, with a superficial covering of salt.

ASSELYN, Jan, a landscape painter, born in 1610, died in Amsterdam in 1660. He studied under Jan Miel and Isaiiah Vandervelde at Antwerp, and under Peter van Laer (Bamboccio) at Rome. In his landscapes taken from the vicinity of Rome, which are enriched with ruins of edifices, and decorated with figures and cattle in the style of Berghem, he imitates the manner of Claude Lorraine. He also painted battle pieces of considerable merit. He was surnamed *Krabbetjie* (little crab, crab-like) by the Dutch artists at Rome, on account of a contraction in his fingers.

ASSEMANI. I. Joseph Simon, a Syrian orientalist, born at Tripoli (Tarablus) in 1687, died in Rome, Jan. 14, 1768. After spending many years in the study of eastern languages, he was employed to collect oriental manuscripts for the library of the Vatican, and finally appointed custodian of the collection, which he largely increased. His principal works are: *Bibliotheca Orientalis Clementino-Vaticana* (Rome, 1719-'28); *Kalendaria Ecclesie Universa* (1755-'7); *Bibliotheca Juris Orientalis Canonici et Civilis* (1762-'4). He edited also an edition of the *Opera Ephraemi Syri* (1732-'46). **II. Stephan Evodius**, nephew of the preceding, born at Tripoli in 1707, died Nov. 24, 1782. Like his uncle he devoted himself to the study of oriental languages, and like him was made custodian of that department of the library of the Vatican, from which post he was appointed archbishop of Apamea. His investigations among oriental manuscripts were embodied in his two works, *Bibliotheca Mediceo-Laurentina et Palatina Codices Manuscripti Orientales* (Florence, 1742), and *Acta Sanctorum Martyrum Orientalium et Occidentalium* (Rome, 1748). **III. Joseph Aloysius**, brother of the preceding, born at Tripoli about 1710, died in Rome, Feb. 9, 1782. Pursuing the same studies as his uncle and brother, he was appointed professor in the Sapienza at Rome. His works are: *Codex Liturgicus Ecclesie*

Universalis (Rome, 1749), and *De Catholicis seu Patriarchis Chaldaeorum Nestorianorum* (Rome, 1775). IV. *Simon*, a distant relative of the preceding, born at Tripoli, Feb. 20, 1752, died in Padua, April 8, 1821. In 1785 he was appointed professor of oriental languages at Padua, and acquired fame as a student of oriental numismatics, on which subject he published his *Museo cyfico Naniano illustrato* (Padua, 1787-'8), and other works.

ASSEN, a town of the Netherlands, capital of the province of Drenthe, 14 m. S. of Groningen, on the Horn-Diep, which is connected by means of a canal with the Zuyder-Zee; pop. in 1867, 8,448. Near the town are celebrated giants' graves.

ASSER, or *Asserius Menevendi*, a monk of St. David's or Menevia, in Wales, died about 910. At the request of Alfred the Great he left his monastery for a part of each year to visit the court, where he read Latin with the king and corrected his translations. Alfred gave him many ecclesiastical preferments. Some authorities say he became bishop of Sherborne. Asser's great work is his "Life of Alfred," in Latin. The earliest edition is that of Archbishop Parker, at the end of Walsingham's "History" (1574). The best edition is that of Wise (Oxford, 1722), entitled *Annales Rerum Gestarum Alfreði Magni*. This is our chief authority for the events of Alfred's public and private life from his birth to 889, and conveys much incidental intelligence about the laws, manners, and general civilization of Wessex. Thomas Wright, in the *Biographia Britannica Literaria*, maintains that this life was written at a later date, and Asser's name affixed to it.

ASSIENTO (Sp. *asiento*, treaty), a term used to designate the treaties made by Spain with foreign countries for the supply of negro slaves to her South American provinces. The Spanish government, having no settlements on the African coast, encouraged adventurers to supply slaves by securing to them a monopoly of the trade, with other commercial privileges. The Flemish merchants received the contract from Charles V.; Philip II. gave it to the Genoese, under whose title the traffic was chiefly carried on by British traders; and Philip V. to a French company. The terms of this last asiento were the privilege of sending a ship of 500 tons with merchandise free of duty to Spanish America, and the payment of a sum on each imported negro, the minimum number of slaves being fixed at 4,800 annually. This contract was transferred by the same king to the South sea company, but abrogated shortly after at the peace of Aix-la-Chapelle. It never gave satisfaction to Spain; and the contractors always lost money, their local factors and agents reaping the profits.

ASSIGNATS, the paper currency of the French revolution, first issued in the spring of 1790, to be redeemed by the sale of the confiscated property of the clergy and the emigrants. The assignats kept their value above 90 per cent.

till 1792, but from that time they began to droop. The original issue of 1,200,000,000 francs was increased to 45,578,000,000, besides which there were in circulation a great number of counterfeit notes manufactured abroad. Great efforts were made to prop the market, and stringent laws were enacted to fix prices and force the people to accept the notes at their nominal value; but they soon fell to 60 per

cent., and in 1795 were worth only 18 per cent. In 1796 they were redeemed at $\frac{1}{5}$ of their face in *mandats*, entitling the holder to enter at once upon possession of the public lands at an estimated price. The mandates soon fell to $\frac{1}{10}$ of their nominal value, and in July, 1796, a law was passed authorizing the circulation of mandates at their current value, which resulted in the speedy disappearance of the notes.

ASSIGNATIONS, Russian paper money, introduced early in the reign of Catharine II., about the year 1770, principally to carry on the wars against the Turks. The standard currency was then as now the silver ruble, and the paper assignments on the banks—likewise founded by Catharine—were to represent in full the standard silver coin. But they soon fell until the assignment ruble was worth only one half, one third, and finally one fourth of the original value; and thus it became necessary to specify the nature of the ruble in all transactions. From 1787 the use of assignments as currency was general. In the reign of Paul I. the merchants of St. Petersburg, foreign and domestic, refused to receive assignments at the government standard in payment. Stringent ukases for facilitating the circulation of assignments all over the empire proved unsuccessful, and at the death of Paul (1801), and during the greater part of the reign of Alexander I., the assignment ruble was generally worth one fourth of the silver. During the wars against Napoleon the issue of assignments increased excessively, but no considerable additional depreciation took place. With peace the assignments rose, and finally the government fixed the standard at 8 rubles 60 copecks, either of copper or assignments, for a silver ruble, one assignment ruble equalling 100 copecks copper, and four copecks copper making one of silver. On account of the facility of carrying large

amounts in paper, the assignments soon came into such demand as to be worth a premium. This premium naturally increased with the distance inland, and the fluctuations were so irregular that in 1839 a ukase regulated the value of the assignments at $3\frac{1}{2}$ to 1 silver, and ordered that henceforth the silver ruble should be the legal unit in all negotiations and legal documents; that a new paper money, called "bills of credit," should be issued, and the old assignments gradually withdrawn from circulation and destroyed. This was accomplished.

ASSIGNMENT, in law, the making over or transferring of any species of property. It also signifies the deed or instrument by which the transfer is operated. The assignment of a lease is the transfer of the assignor's whole estate in the term created by the original lease. The difference between an assignment and an underlease is that the underlease retains the reversion, whereas the assignment parts with it. Assignment in commercial law was formerly much restricted. Bills of lading and bills of exchange were not assignable. All interests in personal property, of which a man has not the actual possession, but merely the right to recover, are choses in action. Thus a debt, whether specialty or simple contract, is a chose in action, a something to be recovered. These were not assignable. These restraints were, however, evaded by a license to use the name of the legal creditor. Even under a bill of sale of goods, the property in them does not pass unless by actual delivery and possession as against *bona fide* creditors. Both by the English and French law, property in the power and disposition of a debtor may by process of law be transferred to his creditor.

ASSING. I. *Rosa Maria*, a German poetess, sister of Varnhagen von Ense, born in Düsseldorf, May 28, 1783, died Jan. 22, 1840. The outbreak of the French revolution obliged her family to take up their residence in Strasburg, and in 1796 they removed to Hamburg. After the death of her father in 1799 she became a teacher. In 1816 she married Dr. Assing, a physician of Königsberg, who on her account removed to Hamburg, where his house became a favorite place of literary reunion. The poet Chamisso was a frequent visitor. Rosa's poems have been published, with a memoir of her life, under the title of *Rosa Maria's poetischer Nachlass* (Altona, 1841). II. *Ludmilla*, daughter of the preceding, born at Hamburg, Feb. 22, 1827. After the death of her parents she resided in Berlin with her uncle, the celebrated Varnhagen von Ense, occupying a daughter's place in his house, and receiving an unusually complete education. She first published essays in newspapers and reviews, and in 1857 produced a biography of the countess Elisa von Ahlefeldt. Several other biographies followed from her pen. On the death of her uncle she edited the unpublished portion of his *Denkwürdigkeiten*, issuing the 8th and 9th volumes in 1859. In 1860 she also published Alex-

ander von Humboldt's letters to her uncle, and in 1861-'2 the diaries of Varnhagen von Ense himself. The manner in which political events are treated in this collection brought her into disfavor with the court, and in May, 1862, an action was begun against her in Berlin—she having in the autumn of 1861 taken up her residence in Florence—which resulted in her conviction as a traducer of the king, queen, and various personages, and in her sentence to eight months' imprisonment. A similar trial, and sentence to two years' imprisonment, followed the publication of the remaining volumes of the collection in 1864; but she never actually underwent these punishments. She has since translated much from the Italian.

ASSINIBOIN, a river of British North America, rising in lat. $51^{\circ} 40'$ N. and about lon. 105° E., and joining the Red river of the North at Fort Garry, Manitoba, in lat. $49^{\circ} 54'$ N. Its course is a distance of over 400 m. At a point 22 m. above Fort Garry it is 120 ft. wide, and has here in summer a mean depth of about 6 ft.; 140 m. from its mouth its breadth becomes 230 ft. and its mean depth over 8 ft.; at 280 m. its depth increases to over 11 ft. with a width of 185 ft. It receives in its course the waters of the Little Souris, Qu'appelle or Calling river, the Rapid river or the Little Saskatchewan, White Sand river, and Beaver creek. At its junction with the Little Souris, 140 m. from Fort Garry, the volume of water is 12,899,040 gallons an hour; while at Lane's Post, 118 m. lower down, this volume is diminished, Mr. Hind asserts, more than one half; a result which he attributes to evaporation. At Fort Ellice the secondary banks are 240 ft. high, forming an eroded valley nearly a mile and a half wide. Parts of its course are bordered by inconsiderable forests of oak, ash, elm, maple, birch, poplar, and aspen.

ASSINIBOINS, a tribe of Indians of the Dakota family, in Montana territory, United States, and in Manitoba and the region round about in British America. They were a part of the Yankton Sioux, but after a bitter quarrel about women separated from the mass of the nation about the beginning of the 17th century, and the two parties have since been hostile. Their own distinctive name is never used: the neighboring Algonquin tribes called them Assinipwalak, Stone Sioux, or Stone Warriors, as some infer from the nature of their country near the Lake of the Woods. The adventurous French missionaries reported them as a nation as early as 1640, and at a very early period they traded furs on Hudson bay. In the British provinces they are divided into Assiniboins of the prairies, who are tall, vigorous, and thievish, and Assiniboins of the woods, who are wretchedly poor. They extend from Souris or Mouse river to the Athabasca, and number some 5,000. There are Roman Catholic and Methodist missions among them at Lake Ste. Anne and Pigeon lake. They are friends and allies of the Crees,

and live intermixed with them. In the United States the Red Stone Assiniboin and Upper Assiniboin were estimated in 1871 at 4,850 souls.

ASSISI (anc. *Asisium*), a town of Italy, in the province and 13 m. E. S. E. of Perugia, picturesquely situated on the declivity of a steep hill; pop. about 6,200. It is especially noted as the birthplace of St. Francis, the founder of the order of Franciscans, and contains 12 monasteries of that order. Here are the church and monastery in which St. Francis is buried, and about 2 m. from the town is the celebrated Portiuncula or church where Francis began the preaching of his ascetic life. Assisi was once a Roman municipium of some importance, having a temple of Minerva, of which several Corinthian columns still stand. The region around abounds in mineral waters.

ASSIZE, a term of the common law, having reference to several distinct subjects. Its most general uses are to designate an ordinance for regulating the sale of provisions, and the periodical sittings held by the judges of England and law officers in the various circuits of England and Wales, for the trial of lawsuits as well civil as criminal. The term is of uncertain derivation. It may be either from Lat. *assido*, to assess, or *assideo*, to sit near or together, both of which are incident to the functions discharged at assizes. Suits for the recovery of land were anciently tried by writ of right, or of assize. On these occasions the sheriff impanelled four knights and twelve assistants to try the matters in dispute. This assize could only be held before a judge of the principal courts at Westminster, whereby enormous expense was entailed on the jurors, the parties, and the witnesses. To remedy this grave inconvenience, provision was made by Magna Charta that an assize should be held annually by a judge in each county. This declaration was enlarged by the statute of Westminster (18 Edward I., c. 8), which gave jurisdiction to the judges to sit in the grand assize, not only for the purpose of settling disputes as to land, but also for the adjudication of all civil actions. The sittings thus held are familiarly known as sittings at *nisi prius*. This term originated from the form of the process for summoning and impanelling the jury, which, following the words of the statute of Westminster, directs the sheriff to summon a jury to be at Westminster on the first day of term, unless before (*nisi prius*) a judge shall come to try issues in the county.—The criminal jurisdiction of the court at the assizes is derived from a commission of oyer and terminer and general jail delivery. Courts for these purposes are held at each assize. Two assizes a year are held throughout England and Wales, and in the metropolitan and some other counties which comprise populous districts. Three assizes are held under modern statutes. Courts of quarter sessions are also held in the several counties, cities, and boroughs. The sessions despatch business of a quasi-judicial character,

as ale-house licenses, poor-law questions, or appeals under certain statutes; and of late years, with a view of relieving the pressure of assize business, jurisdiction has been given to county magistrates sitting in sessions to decide certain criminal causes of minor importance. Under the statute, the assizes are held by two judges of the superior courts of Westminster, one of whom usually presides in the criminal, the other in the civil court. All reserved points of law, exceptions, and other purely legal questions arising out of the proceedings at the trial, are argued subsequently at Westminster before the full court. Final judgment cannot be entered up until after the first four days of the term next after the assizes, which gives opportunity to move the court above for new trials, to set aside verdicts, or to stay judgment for any cause assigned. To obviate the evils of the delay thus afforded by common law, a recent statute gives discretion to the judge at *nisi prius* to certify for immediate execution, in all cases of simple contract debts. The bar at the assizes, or "upon circuit," as the more correct phrase is, is composed of the same barristers who argue at Westminster, each in his particular circuit, selected at the beginning of his career, and from which by etiquette he cannot deviate except in extraordinary cases.—**Assize of Bread**, or provisions (*assise venalium*), in England, was the ordinance of a royal officer, or of the municipality, fixing the price and quality of bread, beer, meat, fish, coals, and other necessaries. This was anciently fixed by the clerk of the market of the king's household. By some municipal charters this power was delegated to the corporation. The earliest distinct notice of such an assize bears date 1203. All regulations of the kind were abolished for London and its vicinity in 1815, and they have everywhere fallen into disuse.—**Assizes of Jerusalem** were the laws made in 1099 by Godfrey of Bouillon, and his princes and clergy, for the regulation of the kingdom of Jerusalem, formed in the first crusade.

ASSUAY. See ASUAY.

ASSUMPSIT (Lat., he undertook), in law, the compendious title under which an extensive class of actions are included. After stating the cause of action, the pleadings state that thereupon "the defendant promised to pay." Assumpsit may be either special or common, also called *indebitatus assumpsit*. Under the former are included actions upon written contracts or agreements of all kinds; actions for derelictions of duty by professional men, carriers, or warehousemen; in short, under every circumstance where a contract is in actual existence or can be predicated from the relations of the parties. Common assumpsit is an action brought for goods sold and delivered, money lent, &c. Theoretically all actions of assumpsit are brought to recover compensation in the nature of damages; but, where those damages can be immediately ascertained by the acts of the parties, as for goods sold and

delivered, where a price has been agreed upon, then it is common assumption.

ASSUMPTION, a festival of the Roman Catholic church, instituted to commemorate the ascent of the Virgin Mary into heaven. From a very early period it has been a belief in the western and oriental churches that after her death the Virgin was taken up, body and soul, into heaven. This event is called in the ancient ecclesiastical writings the "assumption," "passage," or "repose," and is mentioned by various early authors, among whom are St. Gregory of Tours in the 6th century, and Andrew of Crete at the beginning of the 8th. The date of the institution of the festival is unknown, but it is mentioned as having been celebrated with great solemnity before the 6th century, in both Greek and Latin churches. It falls on Aug. 15.

ASSUMPTION, a S. E. parish of Louisiana, W. of the Mississippi river, having within its limits Lake Verret and a part of Bayou La Fourche; area, 820 sq. m.; pop. in 1870, 13,234, of whom 6,984 were colored. The soil is very fertile, and the parish is one of the most productive sugar districts in the United States. In 1870 it produced 246,929 bushels of Indian corn, 17,229 lbs. of rice, 9,558 hhd. of sugar, and 499,135 gallons of molasses. Capital, Assumption.

ASSUMPTION, a city of South America. See **ASUNCION**.

ASSUMPTION, one of the Ladrone group of islands in the Pacific ocean, lat. $19^{\circ} 41' N.$, lon. $145^{\circ} 27' E.$ It is of volcanic origin, rises to the height of about 2,000 feet, and is nearly 10 miles in circumference. It produces coconuts, rice, oranges, and breadfruit.

ASSURANCE. See **INSURANCE**.

ASSWAN, or **Assuan** (anc. *Syene*; in the Hebrew Scriptures, *Seveneh*), a town on the southern border of Egypt, on the right bank of the Nile, opposite the island of Elephantine, in lat. $24^{\circ} 5' N.$, a little below the 10th cataract, where the river is first navigable; pop. about 4,000. The tropic of Cancer was anciently but erroneously drawn here. The surrounding country is sandy and desolate, and, with the exception of a few palm groves, is almost destitute of vegetation. The inhabitants are Egyptians, Nubians, and the descendants of Bosnian troops garrisoned there by Sultan Selim I., the conqueror of Egypt, in 1517. Asswan has considerable commerce in dates, senna, wicker baskets, ivory, ostrich feathers, tamarinds, coffee, and slaves. On the S. side are the ruins of an ancient Saracen town, where during the middle ages 20,000 persons died by one visitation of the plague.

ASSYRIA (Gr. *Assyria*; Heb. *Ashshur*), an ancient country in Asia, lying upon both banks of the Tigris, the seat of one of the great monarchies of antiquity, and now comprised within the easternmost dominions of the Turkish empire. The name comes from Asshur, a son of Shem and grandson of Noah, probably

a leader in one of the great early migrations, who was deified and recognized as the tutelary divinity of the country occupied by the descendants of the clan of which he was the chief. In its earlier and most limited sense, Assyria was a narrow territory, mainly on the E. bank of the Tigris, including the triangle formed by that river and the Greater Zab (the Zabatus or Lycus of the classical writers), a district especially known as Aturia; the district of Adiabene, between the Greater Zab and the Lesser (the Caprus of the Greeks and Romans); and some regions to the southeast of the latter. Assyria was thus bounded N. by the snowy Niphates range, which separated it from Armenia, and E. by the Zagros mountains of Kurdistan, which separated it from Media, and on the S. and W. it bordered on Susiana, Babylonia, and western Mesopotamia. It was mountainous in the north and east, a rolling plain in most other parts, and east of the Tigris well watered. Later, when Assyria became the predominant power in the region, the name came to embrace also all northern Mesopotamia. Still later, and in the widest sense, Assyria denoted the entire plain watered by the Euphrates and the Tigris, together with the countries to the west, north, and east, which became subjects of or tributary to the great Assyrian empire.—There is no record of the time when the country was first peopled. Berosus, whose chronology from the commencement of the historic period is confirmed from various sources, makes a period of 36,000 years before the capture of Babylon by Cyrus (538 B. C.); but of this, 34,080 years belong to a mythical dynasty of 86 kings. This number is merely assumed to make up the grand Chaldean cycle of 36,000 years. His historic chronology begins at 2458 B. C., a short period before the time when, according to the Scriptural narrative, Nimrod established his reign in "Babel, and Erech, and Accad, and Calneh, in the land of Shinar," out of which land "went forth Asshur, and builded Nineveh, and the city Rehoboth, and Calah, and Resen between Nineveh and Calah," all cities on or near the upper Tigris. From this time for fully 1,000 years there is no record of Assyria in the Hebrew writers; and down to about 1850, when the inscriptions of Nineveh and Calah had been unearthed and deciphered by Botta, Layard, and others, there was absolutely nothing known of the true history of this great empire, which lasted more than 1,000 years, except as it was for a brief space connected with that of the kingdoms of Israel and Judah. The legends of Ninus, Semiramis, Ninyas, and Sardanapalus have no other foundation than that among the Assyrian kings was one named Asshur-idanni-pal, or similarly, and a queen Sammuramit; that Nineveh was taken by a revolt in which the Medes took part; and that the final destruction of the great palace was by fire.—The earliest known native document of Assyrian

history is impressed upon three clay cylinders found by Layard at Kileh-sherghat, the earlier Asshur, one of the capitals, the only one situated on the right bank of the Tigris. It forms the records of King Tiglath-pileser I., whose date is by other records fixed at about 1130 B. C. From this and other monuments it appears that for many centuries there were in the lands on the Tigris and Euphrates two rival kingdoms, Babylonia and Assyria, each in turn superior to the other; and that about 1250 Assyria had come to be a powerful and compact kingdom, under a single monarch, surrounded on the north and east by scattered tribes, who sometimes coalesced into temporary alliances, but were one by one beaten down and rendered tributary. The Assyrian capital was at Kileh-sherghat, the old Asshur, some 60 m. below Nineveh, and on the opposite bank of the Tigris. On the west it reached the Euphrates; on the south was the rival kingdom of Babylonia. For the next two centuries the history of Assyria is almost a blank. During this period a compact kingdom of Israel was founded by David. The dominion of David and Solomon stretched beyond the range of Lebanon, nominally reaching quite across the desert to the banks of the Euphrates; but it is clear that neither David nor Solomon ever came into contact with the Assyrian power. This power seems indeed to have then become enfeebled; and when, after the separation into Israel and Judah, the Hebrews were pressed back within their old limits, the new kingdom of Damascus had arisen. When our record is resumed, the residence of the Assyrian kings had been removed 40 m. up the Tigris to Calah (now Nimrud), on the E. bank of the river. At the angle formed by the junction of the Upper or Greater Zab, Calah was only 20 m. below the site now recognized as that of Nineveh, and possibly was considered a part of that great city. The monarch whose reign was from 886 to 858 appears on the inscriptions as Asshur-nasir-pal (or, according to other readings, Asshur-izir-pal or Asshur-idanni-pal), "the great king, the powerful king, king of hosts, king of Assyria." He overran the mountain region of Armenia and Kurdistan, and his furthest expedition was through Lebanon and the valley of the Orontes to the Mediterranean shore, where he received the submission of the chief cities of Phœnicia. From Lebanon he brought back the cedar which was used to ornament his palace at Calah or Nimrud. The sculptures from this palace are among the most striking of all the Assyrian remains. He was succeeded by his son Shalmaneser II., whose reign lasted from 858 to 823. He is known as the "black obelisk king," from an obelisk 7 feet high and 22 inches wide, now in the British museum, upon the four sides of which is portrayed, pictorially and literally, the history of his 27 campaigns. These were carried on upon the middle Euphrates, in Babylonia, in the moun-

tains of Kurdistan and Armenia, upon both slopes of Lebanon, down the valley of the Orontes, and in the kingdom of Israel. Among the prostrate figures is one described as Jehu the son of Omri, the king of Israel. The Assyrian king moved down the Mediterranean coast, leaving Judah on his left untouched, but receiving tribute from the Phœnician cities of Tyre, Sidon, and Byblus. Five years before his death Shalmaneser was dethroned by a revolt headed by his eldest son. This revolt was put down by a younger son, Shamash-iva, who reigned 13 years (823-810), carried his arms into Media and Babylonia, and was succeeded by his son Iva-lush, who married Sammuramit, a Babylonian princess who, as the only female ruler recorded in Assyrian history, furnished the Greek fabulists with the name of Semiramis. Babylonia and Assyria seem now to have been formally united; the government of the former being specially put into the hands of a member of the royal Assyrian family, who acted as viceroy. Nineveh, the main ruins of which are now visible at Koyunjik and Nebbi-Yunus, opposite Mosul, had now become the Assyrian capital. The book of Jonah, who is believed to have lived during this period, is of historical value from the glimpse which it affords of the extent of that great city in its palmiest days. If we assume that the 120,000 persons who "knew not their right hand from their left," that is, children, is an approximation to the census, the population of the city would be about 600,000. It is mentioned as a city of three days' journey, containing also "much cattle"; other authorities say it was 17 m. long and 10 broad. The probability is that Nineveh, like Babylon, was a district, about as large as our District of Columbia, enclosed with high walls, containing pastures, fields, and gardens, besides several strongly fortified points. Three other reigns fill up the interval from 781 to 745. With the last of these the reigning dynasty seems to have come to a close; for in 745 we find Tiglath-pileser II., apparently a usurper, on the throne, with his capital at Calah. The duration of the new dynasty, known as the lower monarchy, is variously estimated at 120 or 139 years—745 to 625 or 606. The names of five out of the seven kings of the last dynasty are familiar from their occurrence in the Hebrew records. The first of these was Tiglath-pileser II. His accession (745) coincides closely with one of the great eras of history. The first Greek Olympiad began a generation earlier (776); Rome was, according to her traditions, founded eight years before (753); the Babylonian era of Nabonassar is synchronous within two years (747). Thus the last and most splendid age of the Assyrian empire coincides with the infancy of Greek and Roman civilization. The records of this Tiglath-pileser are fragmentary, for Esar-haddon, his fourth successor, undertook to destroy all the palaces of his pre-

decessor, and to use the materials for the construction of new ones of his own. The work was incomplete when the Assyrian kingdom came to an end. When Tiglath-pileser came to the throne he found all the tributary nations in a state of revolt. In reducing them he struck first at the nearest ones, Babylonia and Chaldea; these were soon reduced to submission. He then had to turn to Syria and Palestine. Hitherto the kingdom of Judah had been able to keep aloof from the quarrels of its neighbors; but now Pekah, king of Israel, and Rezin, king of Syria, entered into a league against Ahaz, the new king of Judah, who applied to Tiglath-pileser for assistance, and paid him tribute. The Assyrian reduced Syria, overran Israel, and began that series of deportations which we know as the captivities, carrying away the people of the northern districts of Israel. Ahaz was now summoned to Damascus to pay homage to his protector and to satisfy his exactions. The Hebrew chronicle records: "Ahaz made Judah naked, and Tiglath-pileser distressed him, but strengthened him not." The next Assyrian king was Shalmaneser IV., of whose short reign (727-721) no mention is found in the Assyrian records yet discovered; but from the Hebrew records we know that he carried on the war against Israel, whose king Hoshea refused to pay the tribute levied upon him. Samaria was beleaguered, and captured after a siege of three years, and her king was "cut off as the foam upon the face of the water." Shalmaneser died during this siege, leaving an infant son. The war was carried on by the *tartan*, or general-in-chief, who soon assumed the government, taking the name of Sargon, or, as the inscriptions are read, Sargina or Saryukin. This Sargon, though only once mentioned in the Hebrew records, is shown by the Assyrian inscriptions to have been a great ruler. He had to finish the war in Palestine. How he did this he tells: "I besieged, took, and occupied the city of Samaria, and carried away 27,280 people who dwelt in it. I changed the former establishments of the country, and set over them my lieutenants." A strong power was now again established in Egypt, which was trying to spread itself to the east. Sabaco, the Egyptian king, had already entered into an alliance with Hoshea of Israel, and was marching to his aid. Sargon, having taken Samaria, moved to meet Sabaco, marching down the Mediterranean coast. The encounter took place at Raphia, near Gaza. The Egyptians were defeated; and Sargon in time came into possession of all the strong places on the Phœnician coasts, though he seems to have been foiled in an attack upon Tyre. All these wars occupied a space of ten years. From them Sargon was recalled by troubles nearer home. Babylonia had asserted its independence under a king called Merodach-baladan, who sought to strengthen himself by alliances with Elam (Susiana) on the east, the

Arabs, Damascus, and Judah on the west, and even with Egypt and Ethiopia. In Judah the national spirit had revived under Hezekiah, who received the messengers from Merodach-baladan with favor, and made an ostentatious display of his resources, but did not formally join the league. Sargon attacked the confederates in detail, routed the Elamites on the plains of Chaldea and marched upon Babylon, defeated Merodach-baladan, took him prisoner, and assumed his kingdoms but spared his life. He then overran Damascus, pushed down the seacoast, and sent a successful expedition over sea to Cyprus. Merodach-baladan took occasion to revolt, and recovered his throne. A conspiracy was formed at home, and Sargon was assassinated (704). His residence was originally at Calah; he rebuilt the walls of Nineveh; but his chief ambition was to replace that capital by a new city on a beautiful site 10 m. N. of Nineveh. This royal residence was named Hisr Sargina, "the house of Sargon." From the ruins of this palace, at Khorsabad, have come many of the most valuable of the Assyrian relics. Sargon was succeeded by his son Sennacherib, the greatest of the Assyrian kings (704-680). The disasters of the last few years of Sargon had reduced the dominions of his son to little more than Assyria proper. Babylonia was in open revolt. In the third year of his reign Sennacherib undertook its reconquest, which was effected in a single brief campaign. The next year he made successful expeditions against Media and Armenia. Hezekiah of Judah had renounced his allegiance to Assyria, conquered Philistia, and formed an alliance with Egypt and Ethiopia. In the fourth year of his reign (701) Sennacherib regained all Hezekiah's conquests, defeated the Egyptians, and shut up Hezekiah in Jerusalem. The Assyrian bass-reliefs are full of scenes of this war. Hezekiah offered his submission, and, according to Sennacherib, sent a tribute of 80 talents of gold, 800 of silver, and a vast quantity of other gifts. To raise this tribute he was forced to strip the temple of its treasures, and to cut off the golden ornaments from the building itself. Sennacherib, having left a detachment under his general-in-chief (*tartan*), chief eunuch (*rab-saris*), and chief cup-bearer (*rab-shakeh*) to receive the submission of Jerusalem, was besieging Lachish, then a strong town on the road to Egypt. Meanwhile a great army under Tirhakah, king of Ethiopia, was advancing to the aid of Judah. Hezekiah, encouraged by Isaiah, refused to surrender. Sennacherib broke up the siege of Lachish and moved to Libnah to meet the Ethiopians. But on the night before the day when battle was to be given occurred that great disaster, of which the Assyrian records contain no mention, but of which the Hebrew account is: "The angel of the Lord went forth and smote in the camp of the Assyrians 185,000." Whatever may have been the na-

ture of this disaster, there can be no doubt that Sennacherib looked upon it as an indication of divine displeasure; for during the remaining 20 years of his reign he made no new attempt upon Judah, although he held on to his conquests in Phœnicia. He was thereafter engaged in numerous and for the most part successful wars. Merodach-baladan again revolted, and was finally crushed in lower Chaldaea. Again the combined rulers of Babylon and Elam, aided by the Arabs on the middle Euphrates, attempted to make head against Assyria, but were defeated in a great battle on the Tigris. Three times more Babylonia revolted, and at the close of the last revolt Babylon was captured and sacked (683). The annals of Sennacherib are silent as to the last three years of his reign, from which it may be inferred that they were years of disaster to his kingdom. He was assassinated in the temple of Nisroch by two of his sons, who fled to Armenia. His great work was the restoration and embellishment of Nineveh, of which his palace at Koyunjik, the most magnificent of the Assyrian ruins, was a part. Sennacherib was succeeded by his fourth son, Esarhaddon (680-667). He appears to have reconquered Babylonia, and to have been appointed viceroy. Esarhaddon is the only Assyrian king who ruled also over Babylonia during his whole reign. He pushed his conquests far and wide, extending them to Cilicia on the west and across the sea to Cyprus, and on the east he advanced into Media further than any of his predecessors had done. He overran Judah, and carried King Manasseh a captive to Babylon, which seems to have been his joint capital with Nineveh. He was the first Assyrian king who actually invaded Egypt, and assumed the title of king of Egypt and Ethiopia. He built two great palaces at Nineveh and Babylon, and began another at Calah. In this unfinished palace the slabs which line the walls were torn from the palaces of former kings, their sculptured faces placed toward the wall, and the backs smoothed preparatory to being carved with the king's own exploits. Toward the close of his reign he divided the empire, placing one of his sons as viceroy over Babylonia. Ashur-bani-pal, whom some consider the Sardanapalus of the Greek romances, ascended the throne in 667, and reigned till 660, or according to others till 647. He was also a great conqueror; but his chief glory is that during his reign, and under his patronage, Assyrian art and literature reached their highest point. He established what may properly be called a great public library. In his palace of Koyunjik were found three chambers the floors of which were covered a foot deep with tablets of clay of all sizes from an inch long to nine inches, covered with inscriptions, many of them so minute as to be read only by the aid of a magnifying glass. The letters had been punched into the moist clay, which was afterward

burned. Most of these tablets were broken into fragments; but as there were four copies of each, many of them have been pieced together, so that they have been deciphered. These partially restored tablets are among the most precious of the cuneiform inscriptions, and contain the annals of the first seven years (which some suppose to be the whole) of the reign of Ashur-bani-pal. (See CUNEIFORM INSCRIPTIONS.) His first campaign was in Egypt, against Tirhakah, who had broken the treaty by which he had agreed to confine himself to his own country of Ethiopia. The Assyrian drove him out of Egypt, of which he took possession, but left the petty rulers in actual government. He had scarcely returned to Nineveh when these rulers allied themselves again with Tirhakah. Ashur-bani-pal went back and took summary vengeance. Memphis, Sais, and other cities were stormed and their people put to the sword. Thebes was taken and sacked to its foundations. When Ashur-bani-pal died, Assyria seemed at the summit of its greatness. But its fall was close at hand. Of his successor nothing remains but a few bricks inscribed with a name which has been read Ashur-emit-ilin. He commenced a palace at Nimrud, the inferiority of which to earlier structures bears witness to the decline, while its unfinished state indicates the sudden downfall of the kingdom. No Assyrian records describe the fall of Nineveh or the events which led to it. Its very time is uncertain, some placing it in 625, others in 606. It is not certain that Ashur-emit-ilin was the last king, for a fragment attributed to Berosus gives Saracus as the name of the ruler under whom the kingdom fell. The account gathered from several writers is this: The Medes, having established their independence and power, made war upon Assyria. The Babylonians, Chaldeans, and Susianians revolted, and joined the Medes. Saracus sent against them his general Nabopolassar, who turned traitor, and, having betrothed his son Nebuchadnezzar to a daughter of the Median king, led the Babylonians upon Nineveh. When Saracus learned this, he burned himself in his palace, as told in the legend of Sardanapalus. Assyria ceased to be a kingdom, not even being embraced within the brief but splendid empire of Babylon, which comprised Babylonia, Chaldaea, Susiana, and the region along the Euphrates. All that was properly Assyria fell to the share of the Medes.—The Assyrians were undoubtedly a homogeneous people of Semitic stock, while the Babylonians were a mixed race, embracing Hamite, Aryan, and Turanian elements. The religion of the Assyrians was apparently in general similar to that of the Babylonians, distinguished mainly by the greater predominance of Ashur, the national deity. He was the "great god," the "king of all the gods," "he who rules supreme over the gods." He was from first to last the main object of worship, never confounded with the personified or individualized deities: Sha-

mas, the sun; Sin, the moon; Nergal, the god of war; Nin, the god of hunting; Iva, the wielder of the thunderbolt; and the like. The great temple at Asshur is the only one yet discovered specially dedicated to him; from which some have inferred that instead of separate temples he had the first place in the fane of all the other divinities. It is more probable that in Assyrian mythology he occupied the place of Brahma in that of the Hindoos. After this supreme god, the source of all being, and the supreme arbiter of all events, came a series of secondary gods, arranged in two series of double triads, male and female. The first consists of Anu, masculine, Anat, feminine—Pluto; Bel, m., Bilit, f.—Jupiter; Hea, m., Mylitta, f.—Neptune. The second triad is Sin, the moon; Shamas, the sun; Iva, the air: in this triad the moon occupies the place of precedence. Then there is a secondary group of five planetary divinities: Ninip, Saturn; Merodach, Jupiter; Nergal, Mars; Ishtar, Venus; Nebo, Mercury. This pentad in time seems to have superseded in popular esteem the older triads, Nebo, like Hermes and Mercury, being the especial patron of learning and eloquence, and the symbol of royal authority. The two triads and the pentad constituted the 12 great deities of the Assyrian pantheon, below which there was a host of inferior divinities, prominent among whom was Nisroch or Salman, the eagle-headed and winged god, whose figure appears so frequently in the sculptures. How little these religious notions served to raise the moral character of the nation, and chiefly of its rulers, is best proved by the sculptural records of the latter, whose greatest and constant boast is the successful hunting of men and beasts, the burning of cities, and flaying and mangling of captives. The monuments of Nineveh more than justify the bitterest invectives of the Hebrew prophets against "the bloody city," which was "full of lies and robbery," with "a multitude of slain" and "no end of corpses."—In certain departments of science the Assyrians attained to considerable eminence. Their system of astronomy was in advance of that of the Egyptians. They knew the synodical period of the moon, the true length of the year, and even, though not quite accurately, the precession of the equinoxes; they made it 30" instead of 50", so that their great cosmical year was 48,200 years instead of 28,000, its true length. They ascribed solar eclipses to their true cause, and calculated lunar eclipses with great accuracy. They must therefore have been acquainted with the golden cycle of 228 lunations, after which eclipses recur in the same order. They fixed this period at 18 years and 10 days, which is within less than 8 hours of the true period.—For further particulars relating to the geography and history of Assyria, see the articles BABYLON, BABYLONIA, CUNEIFORM INSCRIPTIONS, KURDISTAN, MESOPOTAMIA, NINEVEH, and TURKEY. The principal authorities are: Rich's "Journey to the Site of Babylon" (London,

1839); Botta and Flandin's *Monument de Ninive* (5 vols. fol., Paris, 1849-'50); Layard's "Nineveh and its Remains" (2 vols., London, 1849), "Discoveries in the Ruins of Nineveh and Babylon" (London, 1858), and "Monuments of Nineveh" (1849, and continued for several years); Vaux's "Nineveh and Persepolis" (London, 1850); Brandis's *Ueber den historischen Gewinn aus der Entzifferung der Assyrischen Inschriften* (Berlin, 1856); M. von Niebuhr's *Geschichte Assurs und Babels seit Phul* (Berlin, 1857); G. Rawlinson's "Five Great Monarchies of the Ancient World" (vol. i., London, 1862); Oppert's *Les inscriptions assyriennes des Sargonides* (Versailles, 1868); Philip Smith's "Ancient History of the East" (London, 1870).

ASTARTE. See ASHTORETH.

ASTER (Gr. ἀστήρ, a star), a genus of plants of the great family of *compositæ*, so widespread as to induce Lindley to give its name to the

China Aster, Double.

whole family, *asteraceæ*. The plants popularly called asters belong to several genera, but the typical genus is by far the richest in species. Although many parts of the world, as China, the Cape of Good Hope, the Alps, and Siberia, furnish species, many of great beauty, America, and especially New England, seems most amply supplied. Of nearly 200 species cultivated in Europe, 150 are natives of North America. They are perennial herbs, with corymbed, panicled, or racemose heads; flowers radiate, the rays white, purple, or blue, and fertile, the disk yellow or reddish. In the cultivated species the disk flowers give place to repeated series of ray flowers, and assume the appearance of the well known China asters. The finest American species are: *A. Nova Anglia*, whose erect, narrow-leaved stem, 3 to 8 feet high, crowned with large corymbed heads of violet-purple flowers, is often seen by the roadsides; *A. puniceus*, with a purplish

stem, serrate leaves, purple or blue flowers in panicles, found with the preceding, but taller, 6 to 10 feet; *A. lavis*, *macrophyllus*, *spectabilis*, *horizontalis*, *Californicus*, and *mutabilis versicolor*, all worth cultivating; the last two change color with age. In England they are all called Christmas or Michaelmas daisies. The Chinese pay special attention to the cultivation of many species of this genus, and the results of their skill have been introduced in America and are favorites with horticulturists. The first China asters were brought to Europe early in the 18th century. Asters require a free, rich soil, and moderate exposure to the sun. The Chinese cultivate them almost exclusively in pots. *A. argyrophyllus*, a native of New Holland, is a shrubby species, growing to the height of 10 feet; the flowers are very numerous in little heads, whitish gray with yellow disk, and smelling strongly of musk; this species is half-hardy in southern England. *A. caelestis*, from the Cape of Good Hope, is a hot-house plant, blooming the whole year; the flowers sky-blue, disk yellow.

ASTER. I. **Ernst Ludwig von**, a German military engineer, born in Dresden in November, 1778, died in Berlin, Feb. 10, 1855. In 1794 he entered the corps of engineers in the Saxon army, in which his father had held high rank. He was made lieutenant in 1800, and captain in 1809. A plan made by him for the fortification of Torgau attracted the attention of Napoleon, who adopted it; the fortress was finished under Aster's superintendence, and after the Russian campaign, in which he took part, he was appointed its commander. Soon after this he left the Saxon for the Russian service. He fought at Bautzen and Leipsic, and distinguished himself by several expeditions with a detachment of Cossacks which he commanded. In 1813 he reentered the Saxon service, and in 1814 was made colonel. In 1815 he entered the Prussian engineer corps, and took part in the battles of Ligny and Waterloo and in several sieges. In the same year he was made a general, and inspector of the Prussian fortifications. He now established his reputation as a master of his art by the construction of the great fortresses of Coblenz and Ehrenbreitstein. Of these he was appointed commander in 1825, still holding the office of inspector general. He became a lieutenant general in 1827, and in 1842 general of infantry. He was also made a councillor in 1837. He left a collection of essays and volumes, published together after his death, under the title *Nachgelassene Schriften* (5 vols., Berlin, 1856-'61). See also the work of Eiler, *Betrachtungen und Urtheile E. L. von Aster's über die politischen, kirchlichen und pädagogischen Parteibewegungen unsers Jahrhunderts* (2 vols., Saarbrücken, 1858-'9). II. **Karl Heinrich von**, brother of the preceding, born in Dresden, Feb. 4, 1782, died there, Dec. 23, 1855. He entered the Saxon artillery corps in 1796, and took part in the battle of Jena. He was soon after-

ward temporarily assigned to a professorship in the military school at Dresden, and was made lieutenant colonel in 1831. He retired in 1834, and received the honorary rank of colonel in 1844. He wrote many military works, and his *Lehre vom Festungskriege* (2 vols., Dresden, 1812; 8d ed., 1835) is a text book on the subject of fortifications in the Prussian military schools, and has been translated into several languages.

ASTERABAD. See **ASTRABAD**.

ASTERIAS. See **STAR FISH**.

ASTEROIDS, a ring of small planets travelling between the orbits of Mars and Jupiter. It had long been noticed that no empirical law of planetary distances would give an account of the wide disparity between the distance separating the orbits of the earth and Mars and that which separates the paths of Mars and Jupiter. When Sir W. Herschel's discovery of Uranus in 1781 had confirmed Bode's empirical law, astronomers were led to search for a planet travelling in the orbit which, according to that law, should lie between the paths of Mars and Jupiter. On Jan. 1, 1801, such a planet was discovered by Piazzi, who called it Ceres. In March, 1802, while looking for the new planet, Olbers discovered another, travelling at about the same distance from the sun. He called it Pallas. Two others discovered before 1808 were called Juno and Vesta. In 1845 Hencke of Prussia discovered a fifth. Since then the progress of discovery has scarcely been interrupted by a single barren year. Luther in Germany, Goldschmidt in France, Watson in America, Hind in England, and De Gasparis in Italy were until 1873 the most successful asteroid seekers. Recently Prof. Peters of the Litchfield observatory, Clinton, N. Y., has shared their honors, having thus far discovered more asteroids than any other astronomer save Luther. He discovered three new asteroids in July and August, 1872, and two more in February, 1873, raising the known number to 180. —Olbers endeavored to explain the existence of the zone of asteroids by the theory that a planet which had once travelled between the paths of Mars and Jupiter had exploded, and that the asteroids are its fragments. But Prof. Newcomb has shown, by an elaborate investigation of the asteroidal motions, that "although there are some peculiarities which might favor Olbers's hypothesis, there are a far greater number of cases which undoubtedly negative the assumption." Prof. Kirkwood has shown that when the mean distances of the asteroids are arranged in order, certain gaps can be recognized; that in fact "there are no asteroids having mean distances lying near certain definite values." He shows how these gaps by their position indicate the probability that the asteroidal zone was formed from scattered cosmical matter travelling around the sun under the perturbing influence of the planet Jupiter. Leverrier, from an analysis of the motions of Mars, has shown that the combined mass of all the aste-

roids probably falls far short of one fourth of the earth's mass. More than a third of the known asteroids have been discovered in the two months April and September, and less than a third in the six months January, February, June, July, November, and December.

ASTHMA (Gr. *ἀσθμα*, from *ἀνν*, to blow), a disease characterized by an extreme difficulty of respiration, which is worse at certain seasons of the year and particular periods of the day, being generally most severe at night. The difficulty of breathing is increased by violent emotions, damp atmosphere, excess of any kind, strong exercise, running, walking quickly, or ascending a flight of stairs. It is also more laborious in a horizontal position, and hence more distress is felt in bed at night; the warmth of the bed also excites increased secretion of the mucous follicles, and this blocks up the air passages more completely, causing paroxysms to be more frequent than during the day. The patient seeks relief by sitting upright in bed, or bending his body forward, and endeavoring to expand the chest mechanically by every possible means. Old persons are more liable to the disease than young. Some writers describe the disease mainly as a nervous affection; others as the result of organic lesion of the heart and blood vessels; while others again attribute it to dilatation of the air vesicles of the lungs. All these and many other complications may exist. It is now believed that spasmodic asthma is caused by a spasm of the muscular fibres encircling the bronchial tubes, especially the smaller branches. The existence of these fibres is placed beyond a doubt by microscopic examination. In common asthma the lining membrane of the air passages is more or less affected as in chronic bronchitis, but the affection of the mucous membrane extends further down into the lungs, the air cells are more obstructed, and the conformation of the chest itself is often somewhat contracted and defective. The action of the diaphragm is imperfect, as well as that of the walls of the chest; and hence it is that, from want of innervation and free action in these parts, the disease is commonly deemed nervous, as distinguished from chronic bronchitis, which affects the bronchial mucous membrane chiefly. In spasmodic asthma, the nerves are still more deeply implicated; their action seems defective in the respiratory organs, as stammering shows imperfect nervous action in the organs of speech; and in both cases the difficulty is increased by physical or moral excitement. Chronic asthma seldom shortens life, where patients carefully avoid all violent emotions, exercise, and excess, although spasmodic paroxysms may endanger life at any time where these precautions are neglected. Attacks of spasmodic asthma generally occur during the first sleep, soon after midnight, or very early in the morning. The patient suddenly awakes with a sense of suffocation, tightness of the chest, and difficulty of breathing. The respi-

ration is wheezing and laborious, the shoulders are raised, and every effort made to enlarge the chest. The pulse is usually quick, weak, and irregular; the lower extremities cold. When cough and expectoration come on, the patient is relieved. The spasm, however, may continue half an hour or more, and even as much as three or four hours.—Asthma is often complicated with diseases of the heart or with chronic bronchitis, acting as a source of permanent congestion, predisposing the parts to be more easily thrown into a state of spasm. Sometimes severe attacks of dry catarrh are aggravated by spasm, as in the "bronchial asthma" of Andral.—The most common consequences or concomitants of the disease are chronic inflammation and dilatation of the bronchi; emphysema and oedema of the lungs; hæmoptysis; tubercular deposits; hypertrophy and dilatation of the cavities of the heart; effusions into the pericardium, the pleura, and sometimes congestion and effusions in the head, giving rise to coma or apoplexy. The treatment of the paroxysm consists in administering narcotics and antispasmodics, to be given if possible as soon as the first sensations are felt. Strong coffee, laudanum, and ether are among the best; and stramonium smoked as tobacco is often very useful, but should be used with caution where the heart is diseased. Those medicines are most effectual which produce expectoration.

ASTI (anc. *Asta Pompeia*), a city of N. Italy, in the province of Alessandria, 36 m. by rail E. S. E. of Turin; pop. in 1872, 81,038. In the middle ages it was the capital of the republic of Asti, which maintained its independence from 1098 to 1155, in which latter year the city was burned by Frederick Barbarossa. Old walls surround it, and it contains several celebrated buildings. Near the city is made the wine which bears its name. Asti is the birthplace of Alfieri.

ASTIÉ, Jean Frédéric, a French writer, born in 1822. He was for some time pastor in New York city, and subsequently professor of philosophy at Lausanne. Among his works are: *Le réveil religieux des États-Unis*, 1857-'8 (Lausanne, 1859), and *Histoire de la république des États-Unis depuis l'établissement des premières colonies jusqu'à l'élection du président Lincoln*, 1620-1860 (2 vols., 1865).

ASTLEY, Philip, an English equestrian, born at Newcastle-under-Lyne in 1742, died in Paris, Oct. 20, 1814. He served seven years in the light horse, and receiving an honorable discharge supported himself for some time by exhibitions of horsemanship. He at length acquired sufficient means to build a circus or amphitheatre, which he conducted successfully for many years, though it was several times partially burned and rebuilt. In 1804 he leased it to his son. He also built for his own use 19 theatres in London, Paris, and Dublin, and in connection with Antoine Franconi assisted to establish the "Olympic Circus." He pub-

lished "Remarks on the Duty and Profession of a Soldier" (1794); "Description and Historical Account of the Places near the Theatre of War in the Low Countries" (1794); "Astley System of Equestrian Education" (1801).

ASTOLPHUS, or *Astolphus*, called by the Germans *Aistulf*, king of the Lombards in northern Italy, succeeded his brother *Rachis* in 749, and died in 756. After having seized the exarchate of Ravenna, he threatened Rome. Pope Stephen II. fled to France and demanded aid from King Pepin, who crossed the Alps in 754 with an army, defeated Astolphus, and besieged Pavia. The Lombard obtained peace on condition of surrendering Ravenna and all his other conquests; but on Pepin's withdrawal he burst forth again, laid siege to Rome, and ravaged all the surrounding country. The pope again supplicated Pepin, who crossed the Alps and shut Astolphus up in Pavia. Astolphus was preparing for a new war, but fell from his horse while hunting, and died three days afterward without leaving male heirs.

ASTOR, John Jacob, a merchant of the city of New York, born at Walldorf, near Heidelberg, July 17, 1768, died in New York, March 29, 1848. He was the youngest of the four sons of a peasant, and his boyhood was passed in work upon his father's farm. Two of his brothers had left their home, one of them to establish himself as a maker of musical instruments in London, and the other to settle in America. At the age of 16 Astor accepted an invitation from the former to join him in his business, and he, walking to the coast of Holland, embarked for London in a Dutch smack. In London he worked industriously till 1783, when, a few months after the recognition of the independence of the United States by Great Britain, he sailed for Baltimore, taking with him a few hundred dollars' worth of musical instruments to dispose of on commission. On the voyage he made acquaintance with a furrier, in accordance with whose suggestions he exchanged his musical instruments in New York for furs, with which he hastened back to London, where he disposed of them to great advantage. He soon returned to New York and established himself there in the fur trade, prospering so fast that in a few years he was able to send his furs to Europe and the East in his own ships, which brought back cargoes of foreign produce to be disposed of in New York. At the beginning of the century he was worth \$250,000, and he now began to revolve colossal schemes of supplying with furs all the markets of the world, and of planting towns and spreading civilization in the wilds of the western continent. It was his aim to organize the fur trade from the lakes to the Pacific by establishing numerous trading posts, making a central depot at the mouth of the Columbia river, and then, by obtaining one of the Sandwich islands as a station, to supply the Chinese and Indian markets with furs sent directly from the Pacific coast. In prosecuting

this gigantic scheme it is said that he expected only outlay during the first 10 years, and unprofitable returns during the second 10, but after that a net annual result of about \$1,000,000. The settlement of Astoria was founded in 1811, but the scheme was never fully carried out. Astor early began to make investments in real estate in New York, and in the rapid growth of the city the value of some portions of his property nearly centupled. He erected many handsome private and public buildings. His fortune has been estimated at \$20,000,000. During his whole career he hardly made a misstep through defect of his own judgment, and his memory retained for years the minutest details. He lived during nearly a quarter of a century in retirement, in the society of his family and of eminent practical and literary men, his mind retaining its vigor after his bodily strength had become greatly enfeebled. He gave many liberal donations during his lifetime, and his will contained numerous charitable provisions. One of these was \$50,000 for the benefit of the poor of Walldorf, his native village. Among his most useful bequests was that of \$400,000 to found the Astor library in the city of New York, the fruit of a long cherished purpose, and of much consultation in the latter part of his life. (See *ASTOR LIBRARY*.)

ASTORGA (anc. *Asturica Augusta*), a city of Spain, in the province and 80 m. by rail W. S. W. of Leon, is situated on an elevated plain 2 m. from the river Tuerio; pop. 5,000. It is surrounded by ruined walls, and has an ancient Gothic cathedral with a high altar of great beauty, an old castle, and some Roman remains. Napoleon made Astorga his headquarters during the pursuit of Sir John Moore, at the beginning of 1809. In 1810 it was taken after an obstinate defence by Junot, and in 1812 retaken by the Spaniards.

ASTORGA, Emmanuele d', a Sicilian musical composer, born at Palermo, Dec. 11, 1681, died in Bohemia, Aug. 21, 1736. His father, a Sicilian of rank, in command of a band of mercenary troops, resisted the union of Sicily with Spain; but his soldiers betrayed him, and he was executed in the presence of his wife and son. The former immediately died of grief, and Emmanuele was for a time almost idiotic and helpless. Recovering, he entered a convent at Astorga, from which town he took his surname. Here he speedily developed a remarkable musical talent, and in 1704 became a court musician and composer at Parma. Soon afterward he attached himself to the suite of the emperor Leopold, and after his death in 1705 travelled extensively, but at last entered a convent in Bohemia, where he spent the remainder of his life. His principal work is his *Stabat Mater*, of which the original MS. is preserved in the library of Oxford.

ASTORIA, a town of Clatsop county, Oregon, near the mouth of the Columbia river; pop. in 1870, 639. It was for a long time the depot of the fur trade for all the country west of the

Rocky mountains, and was formerly a port of entry. The difficulties in the entrance to the Columbia have, however, opposed a great impediment to its development. It was founded by the Pacific fur company in 1811, and named in honor of John Jacob Astor, the chief proprietor. Its early history is described by Washington Irving in his "Astoria."

ASTOR LIBRARY, an institution founded under the will of John Jacob Astor, who bequeathed \$400,000 "for the establishment of a public library in the city of New York." By a provision of the will, the government of the library was vested in 11 trustees, in whose keeping were placed all the property and effects of the institution; in them existed all power to invest and expend the funds, and to manage the affairs of the library. Among the first trustees named by the testator were Washington Irving, William B. Astor, Joseph G. Cogswell, Fitz-Greene Halleck, besides five other gentlemen, and the mayor of New York and the chancellor of the state *ex officio*. By a subsequent codicil, Charles Astor Bristed, the testator's grandson, was appointed an additional trustee. A provision of the will designated, as the land whereon to erect a suitable building for the purposes of the library, a lot situated upon the east side of Lafayette place, measuring 80 ft. in front by 120 ft. deep. As early as 1839 Mr. Astor had purchased a number of volumes, aided by Dr. Cogswell, with the ultimate intention expressed in his will. In May, 1848, the trustees of the library met for the first time, and in accordance with the desire of Mr. Astor, appointed Dr. Cogswell superintendent. He went to Europe in the autumn of 1848, authorized to purchase books to the amount of \$20,000. During an absence of four months he collected 20,000 volumes, which were temporarily placed in a building rented for the purpose. A second and third visit by the superintendent increased the number of volumes to 70,000, with which the first building was opened, Jan. 9, 1854. The Astor library is built in the Byzantine style of architecture, richly ornamented with brown stone mouldings and an imposing entablature. Its dimensions are in accordance with Mr. Astor's will, the height being about 70 ft. The library room is 100 ft. in length by 64 in width, and 50 in height; this is reached by a flight of 36 marble steps. The lower rooms are chiefly used for the deposit of public documents and for the meetings of the trustees. Since the erection of this building the number of volumes has increased to nearly 150,000, not quite filling the second building, which has since been erected. The books are arranged according to subjects. In the selection of books Dr. Cogswell, upon whom devolved the whole of this labor and responsibility, chose only such works as his experience and knowledge of bibliography taught him would be most useful to a young and growing country. Particular atten-

tion was paid to the department of technology, in which the library is unusually rich. Bibliography also received a large share of Dr. Cogswell's attention, his own private collection having been early added to the library. It is designed to render the department of American history as full as possible, as works of this class are more and more required by the American public. In linguistics, particularly oriental, the Astor library is unsurpassed by any in this country. The natural sciences are also fully represented, comprising about 7,000 volumes, many of them rare and costly. In January, 1856, the first building having become filled, and the necessity for more room obviously existing, Mr. William B. Astor, eldest son of the founder of the library, made a donation to the trustees of an adjacent piece of land 80 ft. wide and 120 ft. deep. Upon this a building similar to the first was erected in 1859, and formally opened to the public on the 1st of September in that year. Both edifices, capable of containing 200,000 volumes, will soon be filled. In December, 1866, William B. Astor made a further donation to the library of \$50,000, \$20,000 of which he directed to be expended in buying books, and the remainder to be added to the general funds of the library. The catalogue of the Astor library, as prepared by Dr. Cogswell, comprises five octavo volumes of 500 pages each, four volumes containing the alphabetical list of authors' names, the fifth the supplemental list up to 1866, and the analytical index of subjects to the whole. The present superintendent is Dr. E. R. Straznicky, formerly first assistant librarian, his two predecessors, the late Dr. Cogswell and Mr. Francis Schroeder, having resigned, the former Jan. 1, 1862, and the latter July 1, 1871.

ASTRABAD, or **Asterabad**. I. A northern province of Persia, lying along the S. coast of a large bay of the same name, which forms the S. E. extremity of the Caspian sea. The surface is generally hilly, but near the principal rivers, the Gurgan and the Attruk, are considerable plains. The soil is fertile, and excellent fruit is everywhere produced. Large parts of the province, especially the plains near the rivers, form the favorite camping grounds and cattle pastures of the Goklan, Yamud, and other nomadic tribes. The climate is mild and equable. II. A town, capital of the preceding province, in lat. 36° 50' N., lon. 54° 45' E., 15 m. S. E. of the Caspian sea, and 190 m. E. N. E. of Teheran; pop. about 10,000. A wall about two miles in circumference encircles it. The buildings are low and insignificant, and the trade and industries are unimportant. The town is exceedingly unhealthy, as the marshes and bodies of water near it send up malarious vapors of the most dangerous character. It is commonly known as "the city of the plague," and in the summer is almost deserted by its inhabitants. Astrabad was formerly the residence of the Kajar princes, the ancestors of the present Persian dynasty.

ASTRÆA (Gr. *ἀστρᾶία*, starry), a genus of radiate animals of the polyp family, which attach themselves to marine bodies, and are often found collected together into a globular or hemispherical mass, known as one of the forms of coral. The upper surface of these masses is entirely covered with little cavities of stellar form, each one of which is the receptacle of a polyp, and in the centre is its mouth, from which radiate its numerous tentacula or arms. These cavities are either in close contact or separated by intervening spaces; and this feature is made the basis for dividing the genus into two sections, the first of which is represented by the common East India species, *A. favosa*, and the other by the *A. rotulosa* of the West Indies.

ASTRAKHAN, or *Astrachan*. **I.** A government of S. E. Russia, on the N. W. shore of the Caspian sea; area, 85,010 sq. m.; pop. in 1867, 573,954, including 134,000 Kirghizes. The Volga, flowing from N. W. to S. E., divides it into two arid steppes of nearly equal size, with a few fertile tracts, pasture lands, and grain fields along the banks of the river. The whole country seems to have once been covered by the Caspian, and the soil abounds with saline ingredients. Salt lakes and marshes are abundant. Rock salt and gypsum are found. There are few trees. The climate is extremely hot in summer and cold in winter, and unwholesome to strangers. Cattle, goats, and a poor breed of horses are raised, and the goat skins are used for the manufacture of morocco leather. The most valuable industry is fishing, the fisheries of the Volga being extraordinarily productive. The principal rivers besides the Volga are the Akhtuba, Sarpa, and Kuma. The most important towns, besides the capital, are Krasnoi-Yar, Tchernoi-Yar, and Tzarev. The population is composed of Kalmucks, Kirghizes, Tartars—these three being nomadic tribes—and Russians, Armenians, Persians, Hindoos, and Germans. Astrakhan was anciently a khanate of the Golden Horde of Tartars, and embraced, besides Astrakhan proper, Saratov, Orenburg, and the Caucasus. It was annexed to Russia by the czar Ivan the Terrible in 1554. **II.** The capital of the preceding government, situated on an island formed by one of the branches of the Volga, about 20 m. from the sea; pop. in 1867, 47,839. The houses are partly of brick, partly of wood, and the streets are crooked, unpaved, and dirty. The population is composed of all nations of Europe and Asia, and of nearly all creeds. There are mosques for the Mohammedans and sanctuaries for the Hindoos, as well as Christian churches. The city has a naval academy, several public schools, a Greek theological seminary, Greek and Armenian archbishops, and a printing office for the Kalmuck language. About 100 small manufacturing establishments produce cashmere shawls, silk and cotton fabrics, furs, dyes, powder, and salt. The salt works are very extensive, and its fisheries in

the Volga and Caspian are, next to those of Newfoundland, the most important in the world. Astrakhan is an entrepot of the Russian oriental trade, and the raw produce from the remoter regions, consisting principally of hides, sheepskins, and grease, is brought there. The Volga is its great channel of inland navigation, and in 1868 its imports were valued at \$997,976, and its exports at \$315,448. The trade of the Caspian, with Astrabad and other Persian ports on the S. and Tartary on the E., belongs almost wholly to Astrakhan and Baku. The harbor of Astrakhan, however, is much obstructed by sand.

ASTRINGENTS (Lat. *astringere*, to bind), agents which have the power to contract the animal tissues, diminish the amount of their fluids, and increase their density. They seem to act partly by a direct coagulation of albuminous and gelatinous structures, and partly by diminishing the size of the blood vessels and consequently the amount of blood. An example of the first mode is seen in the formation of leather by tanning, which, however, is a degree of action far beyond what can take place in the living body. Astringents diminish both the absorbing and secreting functions of mucous membranes, and coagulate the secretions already formed. They excite a peculiar feeling of dryness and puckering in the month. They are used to check bleeding and excessive discharges from mucous membranes, to promote the healing of ulcerated surfaces, and to restore lax and flabby tissues to their normal firmness. Some of them are absorbed, and, after passing through the blood, are excreted by the kidneys.—The vegetable astringents, nutgalls, oak and hemlock bark, kino, catechu, rhatany, logwood, crane's-bill, *ucca ursi*, wintergreen, and a large number of others, contain more or less of the different forms of tannic and gallic acids. The chief mineral astringents are acetate of lead, the different alums, persalts of iron, nitrate of silver, and the sulphates of copper and zinc. Some astringents, as tannic acid, alum, and lead, find a useful application in the arts of dyeing and tanning.

ASTROLOGY (Gr. *ἀστρον*, star or constellation, and *λόγος*, discourse), a system of rules for discovering future events by studying the positions of the heavenly bodies, which was received for ages as a science, but has now lost all credit in civilized nations. It was divided into two kinds: judicial, by which the fate and acts of men and nations might be foreknown; and natural, by which the events of brute and inanimate nature, such as the changes of the weather, &c., might be predicted. The etymological meaning of the word astrology is almost the same as that of astronomy; and there was no clear distinction made between the two branches until the time of Galileo. Previously, most students of the movements of the heavenly bodies had been more or less astrologers. The invention of the telescope and the general establishment of the Copernican system

first gradually displaced astrology for the benefit of true scientific knowledge.—Astrology was early developed in Egypt, but chiefly flourished in Chaldea, whose “star-gazers and monthly prognosticators” were so famous that the name Chaldee came to be used as identical with astrologer, not only in the Scriptures, but also by the classical writers. In the East it still has its votaries. It was much practised in imperial Rome. It was forbidden by Augustus, and the edict was often reenacted by later emperors, but was apparently not much regarded. The Arabs revived astrology with astronomy. The Moors in Spain held it in great respect, and by their influence it was made popular among the Gothic nations of western Europe. The astronomical tables of Alfonso X. in the 13th century were in great part intended for astrological purposes. Astrology continued to increase in credit till the middle of the 16th century, was still practised at European courts at the end of the 17th, and had a few votaries till the end of the 18th, even in England. It was in high repute at the court of Catharine de’ Medici; it was considered a science even by Kepler; and Lilly, the last of the famous astrologers, was called before a committee of the house of commons in the reign of Charles II. to give his opinion of future events.—The general method of procedure in finding the fate of any man or enterprise was to draw a horoscope, representing the position of the stars and planets, either in the whole heaven, or within one degree above the eastern horizon, at the time of birth of the individual or the inception of the undertaking. Arbitrary significations were given to different heavenly bodies, as they appeared singly or in conjunction; and according to these significations, the horoscope was interpreted. The presence of Venus foretold love; Mars, war; Jupiter, power; the Pleiades, storms at sea, &c. The system of a reputable astrologer in the 16th century required years for its mastery; and absurd as its fundamental principles now appear, its details were not inconsistent with each other, and the whole system has a completeness which appears very singular in a scheme so visionary.

ASTRONOMY (Gr. *ἀστρον*, a star, and *νόμος*, law), the science which deals with the movements, distribution, and physical characteristics of the heavenly bodies. That astronomy is the most ancient of all the sciences, save agriculture, can scarcely be questioned. In the earliest ages men must have required measures of time, and such measures could only be obtained from the study of the motions and appearances of the celestial bodies. The origin of astronomy has been referred to several nations. The evidence in favor of the Chaldeans seems on the whole the strongest. We find in Ptolemy’s *Almagest* the records of observations of considerable accuracy made at Babylon at a very early epoch. Some of the observations which were transmitted to Aristotle by Callisthenes were made about 2250

years B. C. The Chaldean investigations of the motions of the moon were in many respects remarkable. In particular their invention of the saros indicates not merely very accurate observation and a careful discussion of the results, but considerable ingenuity. They were also acquainted with the art of dialling; they had discovered the precession of the equinoxes, and had determined the length of the tropical year to within less than half a minute of its true value. There are even reasons for believing that they were acquainted with the true system of the universe; and we learn from Diodorus Siculus and Apollonius Myndius that the Chaldean astronomers regarded comets as bodies travelling in extended orbits, and even in some instances predicted the return of these objects. Indian astronomy does not appear to have been by any means so accurate as that taught by the Chaldeans. The Indian system seems indeed to have belonged to a more northerly latitude than Benares, the chief seat of Hindoo learning. Accordingly M. Bailly was led to ascribe the origin of the system to a nation which had inhabited higher latitudes; and he even went so far as to invent a nation for the occasion, the Atlantides, and to ascribe to that apocryphal nation a wholly incredible degree of learning. It may be inferred that the want of agreement between celestial phenomena in India and the Indian system of astronomy, instead of justifying M. Bailly’s argument, shows rather that the Indian astronomers were but imperfectly acquainted with the phenomena of the heavens. Nor is it easy to accept the opinion of Prof. Smyth, astronomer royal for Scotland, that the ancient Egyptians, the architects of the great pyramid, were acquainted with all the facts which he conceives to have been symbolized in that remarkable edifice. That the pyramid was erected for astronomical purposes may be admitted; and we may accept Prof. Smyth’s conclusion that the building of the pyramid corresponded to the time when the star *Draconis* at its upper transit was visible (as well by day as by night) through the long inclined passage which forms one of the characteristic features of the pyramid. This would set the epoch about the year 2170 B. C. And it is a remarkable fact that, as Prof. Smyth points out, the Pleiades were at that time in a most peculiar position, well worthy of being monumentally commemorated; “for they were actually at the commencing point of all right ascensions, or at the very beginning of running that great round of stellar chronological mensuration which takes 25,868 years to return into itself again, and has been called elsewhere, for reasons derived from far other studies than anything hitherto connected with the great pyramid, the ‘great year of the Pleiades.’” But although we may thus set the astronomical system of the early Egyptians in a far antiquity, it seems unsafe to follow Smyth in believing that the builders of the great pyramid were acquainted with

the sun's distance, with the true length of the precessional period, and with other astronomical elements the discovery of which has rewarded the exact methods and the profound mathematical researches of modern times.—As to Chinese astronomy, we have abundant evidence to show that it was inexact, though undoubtedly very ancient. Its antiquity may be inferred from the circumstance that the emperor Chwen-hio adopted as an epoch a conjunction of the planets Mercury, Mars, Jupiter, and Saturn, which has been shown by M. Bailly to have occurred no less than 2449 years B. C. In a remarkable work on the subject of Chinese astronomy, recently published by Mr. Williams, assistant secretary of the astronomical society of England, we are told that the instruments at present used by Chinese astronomers, as well as their principal methods of calculation, were introduced by Jesuit missionaries. Yet the ancient Chinese must have possessed some familiarity with the celestial motions. They could calculate eclipses; for we learn that “in the reign of the emperor Chow-kang, the chief astronomers Ho and Hi were condemned to death for failing to announce a solar eclipse which took place 2169 B. C.,” a clear proof that the prediction of eclipses was a part of the duty of the imperial astronomers. The Chinese were also acquainted with the Metonic and Callippic cycles.—The earliest Greek school of astronomy was that founded by Thales of Miletus (600 B. C.) and termed the Ionian school. Thales appears to have been acquainted with the motions of the sun and moon, with the explanation of seasonal changes, and with the length of the year. It has been said that he taught mariners to regard the Lesser Bear rather than the Greater as the polar constellation; but Manilius ascribes the selection of the Lesser Bear as the cynosure to the Phœnicians. To Pythagoras, who also belonged to the Ionian school, a knowledge of the true theory of the earth has been ascribed, though on insufficient grounds. According to the statement of his pupil Philolaus, he taught that “the earth and planets move in oblique circles (or ellipses) about fire, as the sun and moon do”—a statement which certainly does not as it stands indicate exact knowledge respecting the constitution of the solar system. Nicetas of Syracuse is said in like manner to have taught that the diurnal motions of the celestial bodies are caused by the rotation of the earth upon her axis. “Theophrastus,” says Cicero, “narrates that Nicetas of Syracuse held that the sun, moon, and stars are at rest, and the earth alone moves, turning about its axis, by which the same phenomena are produced as if the contrary were the case.” Eudoxus of Cnidus first endeavored to explain the looped paths of the planets, solving the problem by the invention of the theory of concentric spheres.—But it was by the Alexandrian school, founded under the Ptolemies, that exact and systematic observation of the celestial bodies was first

undertaken. Hipparchus of Nicæa (160 B. C.) surpassed all the astronomers of antiquity in skill and acumen. He made the first catalogue of the stars, and was the first to calculate the motions of the sun and moon. He also made a series of observations of the planets, and represented their motions by the famous theory of epicycles—a theory which, though unsound, was in so far in advance of previous ideas, that it was intended to be brought into comparison with the real motions of the celestial bodies. Hipparchus also invented plane and spherical trigonometry. Ptolemy is another distinguished member of the Alexandrian school. Some of the theories and observations which have been ascribed to him were indeed due to the labors of Hipparchus. Thus the Ptolemaic system of astronomy was wholly based on the theories of his predecessor; and the star places indicated in his works seem to have been simply deduced from Hipparchus's catalogue of 1,081 stars by introducing a correction for precession. Yet Ptolemy's labors were unquestionably important. He detected the inequality in the moon's motions called the evection, and was the first to recognize the effect of refraction in altering the apparent places of the heavenly bodies. His work, the *Almagest* (or the *Syntaxis*), contains nearly all that we know of the astronomy of the ancients. The school of Alexandria ceased to exist when Egypt was invaded and conquered by the Mohammedans, and the celebrated Alexandrian library destroyed, in the 7th century. The Arabians, however, formed no contemptible astronomers. They even surpassed the Greeks in the department of practical astronomy; and they handed down to the Europeans the system which they had derived from their predecessors.—In the 13th century European astronomy may be said to have had its origin or revival, though nearly two centuries elapsed before any important advance was effected. Toward the close of the 15th century the labors of Purbach and Regiomontanus prepared the way for the work of Copernicus, the founder of the true system of astronomy; while Waltherus revived the art of astronomical observation, and thus indirectly supplied the means of establishing the theories of Copernicus, Kepler, and Newton. Copernicus (born in 1473) found that by placing the sun instead of the earth at the centre of the scheme, there resulted a simple and rational explanation of all the chief motions of the planets. He was not able to show, however, that the epicycles of Hipparchus and Ptolemy could be wholly removed. Accordingly, many astronomers, who might have been attracted to the Copernican system if it could have been presented as it is known in our day, were found in the ranks of its opponents. Among these was Tycho Brahe, the Dane, who pointed out that the apparent fixity of the stars is opposed to the Copernican theory, unless the distances of all the stars be assumed to exceed enormously the distance of the earth

from the sun. He therefore adopted a modification of a system once held by the Egyptians, regarding the earth as the centre around which the sun revolves, while the planets revolve around the sun as a subordinate centre. Although this was a retrogression, astronomy owes a debt of gratitude to Tycho Brahe for the observations by which he endeavored to put the Copernican theory to the test. His observations of Mars, in particular, enabled Kepler to remove for ever from astronomy the cycles and epicycles, centrics and eccentrics of the old systems. Endeavoring to explain the motions of Mars on the Copernican theory, Kepler found himself baffled so long as he adhered to circular and uniform motions so combined as to produce epicyclic paths. He was thus led to try whether the ellipse would better explain the movements of Mars. After long and patient study he was able in 1609 to establish his first two laws, and nine years later his third law. The three laws are as follows: 1. Every planet describes an ellipse about the sun, this orb occupying one focus of each such ellipse. 2. If a line be supposed continually drawn from the sun to any given planet, this line will sweep over equal areas in equal times. 3. The squares of the periodic times of the planets are proportional to the cubes of their mean distances. In the mean time the telescope had been invented, and when less than one year had passed after the publication of the first two laws of Kepler, Galileo had made a series of observations tending to illustrate if not even to demonstrate the truth of the Copernican system. In particular his discovery of the satellites of Jupiter, and the recognition of the motions of these orbs around their primary, was felt even by the enemies of the new theory to be strikingly in its favor. Here was a system in which the motions of the earth and planets around the sun seemed pictured in miniature. The discovery of the phases of Venus was also regarded as a serious blow to the Ptolemaic system. The invention of the telescope supplied also the means of determining the places and therefore the motions of the celestial bodies with a degree of accuracy which had hitherto been unattainable. Hevelius indeed endeavored to make a stand against the innovation, adhering until the end of his career to the methods used by the ancients. But gradually the telescope prevailed, and the way was thus prepared for the researches of Newton, whose discovery of the law of gravitation would never have been admitted but for the evidence in its favor attained by means of telescopic observations. In particular, the measurement of the earth's dimensions with the requisite accuracy could not have been accomplished without telescopic observations of star places; and Newton would have been unable to show that the moon is retained in her orbit by the same force which draws objects to the earth's surface, had not accurate measurements of the earth been ob-

tained by Picard. We know in fact that Newton was led by erroneous ideas of the earth's dimensions to abandon the theory of gravitation for nearly 20 years. Returning to his researches in 1680, when news of Picard's results had reached him, Newton was able to establish the theory of gravitation on a firm and stable basis. He showed that the moon is drawn to the earth by terrestrial gravity, diminished at the moon's distance in the same degree that the square of that distance exceeds the distance of points on the earth's surface from the earth's centre. He proved that when the force of attraction diminishes according to the law of the inverse square, the attracted body will obey all the laws of Kepler in its motions around the attracting orb. Then he extended his inquiries to the mutual perturbations of bodies so moving. Taking the moon as an instance of the effects of perturbation, he showed how several peculiarities in her motions which had hitherto seemed inexplicable are caused by the sun's perturbing action on the moon, that is, by the excess or defect of his action on the moon in different parts of her orbit, as compared with his action on the earth. Pursuing his researches, he showed how the precession of the equinoxes can be accounted for by the law of gravitation; he formed and discussed two theories of the tides; he solved the problem presented by the oblateness of the earth's figure. Half a century passed before any attempts were made to extend the reasoning of the *Principia*, or to develop the views of its author. During this half century British mathematicians were chiefly engaged in defending, continental mathematicians in attacking, the principle of universal gravitation. But in 1745 Euler and Clairaut began to apply the new methods of mathematical analysis to the problems discussed by Newton. Clairaut succeeded in explaining the lunar evection, which had foiled Newton; and this success encouraged continental astronomers to devote their powers to the investigation of the problems presented by the celestial motions. They mastered one after another the difficulties of the lunar and planetary perturbations. The analytical researches of Lagrange and Laplace, and in particular the discovery (independently made by both) of the great laws on which the stability of the planetary system depends, are only inferior to the discovery of the law of gravitation itself in interest and importance. It would be difficult to say which of these two geometers displayed the greater powers of analytical research. If the genius of Lagrange was the more profound, yet Laplace's labors led to more important practical results, and in discovering the real interpretation of the "long inequality" of Jupiter and Saturn he mastered a problem which had foiled his great rival. Yet another noble achievement of Laplace's must be mentioned—his interpretation of the secular acceleration of the moon's mean motion. In recent times it has been shown indeed by

Adams that Laplace's investigation of the subject was imperfect; yet undoubtedly he placed his finger on the true cause of that part of the acceleration which is due to the ordinary forms of perturbation, nor has the cause of the remaining part of the moon's acceleration been hitherto ascertained. Finally, we may regard the publication of his *Mécanique céleste* as forming a veritable epoch in the history of physical astronomy. Passing over many important contributions to the theory of gravitation, we may point to the achievement of Adams and Leverrier in the discovery of the planet Neptune as perhaps the most conclusive of the evidences yet adduced in support of Newton's theory. A planet hitherto unseen was made known to us, not as in the case of Uranus by a happy chance, but by a study of the deviations of a known planet from the path calculated for it by mathematicians. It may be added that the discovery of Neptune led to the recognition of the mastery which American astronomers and mathematicians had obtained over the more recondite departments of analysis. It has been remarked by Prof. Grant of Glasgow that "the results which have been deduced from Bond's observations of the satellite of Neptune, and the mathematical researches of Walker and Peirce, unquestionably exhibit a degree of consistency with the actual observations of Uranus and Neptune which has not been paralleled by any similar efforts in Europe; while at the same time they tend to throw much interesting light on the theory of both planets." Among the more recent contributions to the mathematics of astronomy must be mentioned Adams's discussion of the moon's secular acceleration and the researches to which that discussion led, Delaunay's extension of the lunar theory, and the inquiries of Prof. Newcomb into the same subject.—While mathematical astronomy had been thus advancing, observational astronomy made similar progress. The discovery of Saturn's ring and largest satellite by Huyghens was soon followed by the discovery of four other satellites. Later Sir W. Herschel discovered two other Saturnian satellites, while in comparatively recent times Bond in America and Lassell in England discovered an eighth. Uranus was added to the planetary system by Sir W. Herschel in 1781, and at sundry times four Uranian satellites have since been discovered, while four others are by some supposed to have been seen by Sir W. Herschel. Neptune and his satellite constitute two other known members of the planetary scheme. But to these must be added 130 small planets (see *ASTEROIDS*) which travel between the paths of Mars and Jupiter; while the observations and researches of Bond and Peirce in America and Maxwell in England tend to show that the rings of Saturn are composed of multitudinous small satellites. Apart from these discoveries, the complexity of the scheme ruled over by the sun has been indicated by the discovery

of the fact that multitudes of meteoric systems exist within the confines of the solar domain, and that the component members of these systems must be counted by millions. The recent observations of Profs. Newton and Kirkwood in the United States, Prof. Alexander Herschel and Mr. Glaisher in England, Quetelet in Belgium, Schmidt in Athens, Heis in Germany, and Secchi in Rome, have added largely to our knowledge respecting meteors; while the mathematical researches of Schiaparelli, Adams, Leverrier, and others, have revealed the interesting fact that these bodies are intimately associated with comets.—The telescopic study of the starry depths, though it has been prosecuted laboriously by the Herschels, Struve, Argelander, Mädler, and others, must be regarded as still (owing to the vastness of the domain to be explored) in its infancy. The elder Herschel first conceived the daring idea of gauging the celestial depths; but as a matter of fact the regions surveyed by the two Herschels amount to but a minute portion of the heavens. On the other hand, though Argelander's survey extended over a complete hemisphere, yet the telescopic power employed was but small. Dr. Gould, an American astronomer, is extending Argelander's system of survey to the southern heavens; and the result cannot fail to be of the utmost interest and value. We owe to the Herschels nearly all our present knowledge of the strange objects called nebulae or star cloudlets. Of these only 16 were known in Halley's time, and barely 200 when Sir W. Herschel began his telescopic labors. He and his son added between them nearly 5,000 nebulae to the list of known objects of this class. At present some 5,700 nebulae are known in all.—The theoretical considerations by which the Herschels have endeavored to interpret the scheme of the universe are too important to pass unnoticed in this brief sketch of the history of astronomy. They have presented the galaxy to our contemplation as a scheme of suns, many equalling and many surpassing our own sun in magnitude and splendor, while they have taught that many of the star cloudlets are schemes of suns resembling the galaxy in extent and constitution. If some, as Whewell, Herbert Spencer, and others, do not regard these views as demonstrated or even demonstrable, yet we cannot but contemplate with admiration the activity of mind which enabled the Herschels, after completing unrivalled series of observational researches, to propound theories so magnificent respecting the myriads of orbs which they had examined.—The spectroscopic analysis of the sun and other celestial bodies, in the hands of Kirchhoff, Huggins, Young, Secchi, Zollner, Lockyer, and Respighi, has revealed many facts of importance. It has been shown that in the sun many of our familiar elements exist in the form of vapor. In the planetary atmospheres known vapors, and especially the vapor of water, have been detected. The stars have been proved to be

stars, many closely resembling our sun in elementary constitution, others formed very differently, but all incandescent orbs as he is, and surrounded by the glowing vapors of many elementary substances. The application of the analysis to nebulae has led to the surprising discovery that while many of these objects shine with a light resembling that of our own sun, so that they may be considered to be formed by the aggregation together of many stars, others consist almost wholly of glowing gas, nitrogen and hydrogen forming their chief constituent elements. The observations of recent solar eclipses have been rewarded by many interesting discoveries respecting the physical constitution of the sun, the colored prominences surrounding him, and the corona which lies beyond the prominences. In these discoveries, Huggins, Young, Janssen, Lockyer, Respighi, and Secchi have borne the principal part. The progress of practical astronomy, and particularly the application of the telescope to the determination of the exact position of the celestial bodies, has proceeded *pari passu* with the progress of mathematical analysis and direct telescopic observation. The invention of the equatorial, the transit instrument, the mural circle, and other instruments of exact observation, belongs to the comparatively early history of modern astronomy. In the present day these instruments are constructed with a degree of perfection, and with a multiplicity of contrivances for improving their performance or extending their application, which are truly surprising. Nor have the achievements of instrumental astronomy fallen short of the promise afforded by the qualities of the instruments. It would be sufficient to point out that the telescope has revealed the greater number of those minute inequalities of planetary motion which have afforded the material for the analytical researches above referred to; but we may add that we owe to the telescope the recognition of the aberration of light, the discovery of the proper motions of the stars, the determination of the sun's distance, and the partial solution of the most difficult problem yet attacked by astronomers, the determination of the distances of the stars. Lastly, the spectroscope promises to play an important part in instrumental researches, since already it has been applied to the determination of the velocity with which stars are approaching us or receding from us, and to the measurement of movements taking place within the solar atmospheric envelopes.—For a popular view of astronomy, Sir John Herschel's "Outlines" may be recommended; and full details respecting practical astronomy will be found in the treatise on that subject by Prof. Loomis of New York, justly described by Prof. Nichol as "the best work of the kind in the English language." A thorough knowledge of physical astronomy would require an acquaintance with such works as Laplace's *Mécanique céleste*, translated by Bowditch, Gauss's *The-*

oria Motus Corporum Caelestium, translated by Admiral C. H. Davis, U. S. N. (Boston, 1858), Delambre's *Astronomie*, or Peirce's "Analytical Mechanics" and "Celestial Mechanics." For the history of astronomy, see Whewell's "History of the Inductive Sciences," Grant's "History of Physical Astronomy," Jahn's *Geschichte der Astronomie*, and Delambre's *Histoire de l'Astronomie*. For full information concerning the modern history of astronomy, Zach's *Monatliche Correspondenz*, Lindenau's *Zeitschrift*, Schumacher's *Astronomische Nachrichten*, continued by Dr. Peterson, and Gould's "Astronomical Journal" (Boston) must be consulted; also, the French *Connaissances des temps*, which contain Leverrier's discussions that led to the discovery of Neptune, the Berlin *Jahrbuch*, the Milan *Ephemeridi*, and the American "Ephemeris and Nautical Almanac."

ASTRUC, Jean, a French physician, born at Sauve, March 19, 1684, died May 6, 1766. He was a graduate and became a professor of the medical college of Montpellier as a substitute of Chirac, on whose death he succeeded him in the professorship, after having filled for some time the chair of anatomy in Toulouse. In 1730 he became regent and professor of the faculty of medicine at Paris, and was also physician to the king. His most celebrated work is *De Morbis Venereis Libri sex* (2d ed., 2 vols., 1740; translated into French and other languages); and he was regarded as a high authority on venereal and female diseases and obstetrics, though he excelled rather by his prodigious memory than by inventive genius. Among his many other writings are *Traité des maladies des femmes* (6 vols., 1761-'5), and a posthumous work, *L'art d'accoucher réduit à ses principes* (1 vol., 1768).

ASTURIAS, a former province of N. W. Spain, bordering on the bay of Biscay, bearing the title of principality, and still commonly known by its ancient name, although since 1838 it constitutes the province of Oviedo; area, 4,088 sq. m.; pop. in 1867, 588,081. The surface is irregular and hilly, the country being intersected by offshoots of the Cantabrian mountains, a chain varying in height from 6,000 to 10,000 feet. The scenery is picturesque and wild, and the coast is almost everywhere bold and high. The rivers are few and generally unimportant, the Nalon being the chief. The province is rich in coal, and in the north many mines are worked; the coal is shipped from Aviles and Gijon. Maize, wheat, potatoes, and fruits are the chief productions. The horses of Asturias are celebrated for strength and endurance. The inhabitants are of simple habits, retaining many old Spanish customs and peculiarities of dress that have elsewhere disappeared. They are proud of the freedom of their race from the admixture of Jewish and Arab blood found in the other provinces, and affect a superiority to other Spaniards. The herdsmen (*vaqueros*) among them form a separate and nomadic class, spending the winter on the coast and the sum-

mer in the mountains.—Asturias is famous in Spanish history as the refuge and stronghold to which the Christian Visigoths and their leaders fled when the Moors had gained possession of nearly all the rest of the peninsula, and had routed the Christian army in the battle of the Guadalete, in 711. The Christians held the province until, under the leadership of Pelayo, they gained a victory in 718, and, aided by the Frankish successes elsewhere, gradually drove back the Moors. Pelayo founded the kingdom of Asturias, over which he and his descendants ruled till 757, after which they were called kings of Oviedo. In 914 the court was transferred to Leon, that large district having been generally freed from Moorish rule and joined with Asturias. The title king of Leon was now borne by the reigning sovereign, and the history of Asturias became identical with that of the larger territory. The title of prince of Asturias was created for the Spanish heir apparent by John I. in 1388, at the wish of the duke of Lancaster, whose daughter the prince was about to marry; and the crown prince of Spain was thus designated until the expulsion of the Bourbon dynasty in 1868.

ASTYAGES, son of Cyaxares, the last king of Media and grandfather of Cyrus, by whom, according to Herodotus, he was dethroned after a reign of 35 years (594–559 B. C.). (See **CYRUS**.)

ASUAY, or **Aray**, the largest of the three departments of Ecuador, occupying the whole eastern and southern portions of the country, between lat. 1° N. and 5° S., and lon. 88° and 80° W.; area, about 200,000 sq. m.; pop. about 250,000. In the western portion is an elevated desert, called the Paramo or desert of Asuay, being a plateau formed by the intersection of the Andes by two chains of mountains running E. and W. The eastern parts, however,

are fertile, being well watered by the Napo, Putumayo, and other affluents of the Amazon; and the inhabitants here are engaged in agriculture and cattle breeding. On the edges of the western table land grow cinchona trees, whose bark forms one of the few exports of the country. The principal towns are Oueno and Loja.

ASUNCION, *Nuestra Señora de la Asuncion*, or *Assumption*, the capital of the republic of Paraguay, on the E. bank of the river Paraguay, in lat. 25° 16' S., lon. 57° 42' W., 650 m. N. of Buenos Ayres; pop. in 1857, including suburbs, 48,000. It was founded in 1538 by Juan de Ayolas, and until 1620 was the capital of all the Spanish possessions on the Rio de la Plata. The streets are regularly laid out, but unpaved, and only a few of them have narrow flagged sidewalks. The dwellings are mostly of a single story, the better class built of adobe, with tiled roofs and projecting eaves. In building the ordinary houses, posts are driven into the ground to support the beams and rafters, then strips of bamboo are placed transversely, and the whole chinked and plastered with mud. The finest public building is the cathedral, rebuilt in 1842–'5. There are two other churches, in one of which the dictator Francia was buried, but one night his monument was destroyed, and his bones removed, no one knows whither. The *cabildo* or city hall, in which the congress meets, is a respectable structure; the government palace is a building of one story with a double front and portico. There is a stone quay bordering the river, upon which stand the arsenal and some workshops, mainly for ship building. The principal suburbs are La Recoleta and Lambaré, where are the cemeteries; but until recently the dead were buried in the churches. The climate is healthy, although in summer the thermometer frequently rises above 100°. In

the neighborhood are many pleasant residences. Asuncion is connected by railway with Villa Rica, about 145 m. distant, and is favorably situated for commerce with the interior and upon the river. The population has, like that of all Paraguay, suffered much diminution in consequence of the war of 1865-'9 with Brazil, the Argentine Confederation, and Uruguay, shortly before the close of which the allied forces took possession of the city.

ASYLUM (Gr. *ἀσύλον*), formerly, a place of refuge, from which persons who fled to it could not be taken without sacrilege. The Jewish cities of refuge established by Moses and Joshua are the earliest examples of the custom of which we possess historical evidence. These were six in number, three on each side of the Jordan. There the involuntary homicide might escape the vengeance of the relatives of the deceased. In Greece, the temples, groves, altars, and sometimes the precincts of the temple, were asylums to men convicted or indicted for civil or criminal offences. Yet it was lawful to surround the temple, and let the fugitive die of hunger, and even in some cases to set fire to the building. In the later days of Rome, the eagles of the legions, and the statues and palaces of the emperors, were also asylums. The strongest religious sanction was thrown around these places of refuge. Insolvent debtors and runaway slaves resorted to them in great numbers. As law became more powerful under the Roman government, these asylums came to be regarded as nuisances; and at last an edict of the emperor Tiberius swept most of them away, both legal and pretended. With the barbarian incursions in the East and West, the necessity for asylums again arose. The new right of asylum fell to the churches. Under Constantine the Great, all Christian churches were asylums; the younger Theodosius extended the privilege to all courts, gardens, walks, and houses belonging to the church. The Franks in France and the Visigoths in Spain permitted it. Many of the popes favored this right. All convents, and even bishops' houses, became asylums. Opposed to the right were the temporal lords, whose jurisdiction was curtailed by the asylums. Several popes, in particular Gregory XIV. and Benedict XIII., restricted the right as narrowly as possible. All highway robbers, voluntary homicides, horse or sheep stealers, professional thieves, heretics under inquisition process, those who laid violent hands on nobles, forgers, false coiners, and duellists, were excluded from the privilege. In Germany, where the temporal power was strong, the right of asylum was never very effective. Sometimes, however, the German barons would themselves set up the right of asylum in their castles. The German emperors never regarded the ecclesiastical asylum, and it was entirely swept away by the Protestant princes. In England, in 1487, the right was for the first time restrained by a bull of Pope Innocent VIII.

In 1584, after the reformation had commenced, persons accused of treason were debarred the right of sanctuary, which word is more commonly used in English law than asylum, and hence the phrase, "to take sanctuary," is equivalent to take refuge. In the time of Queen Elizabeth the right of asylum was denied to all criminals, but reserved to debtors. In 1697 the right of asylum was at length taken away from insolvent debtors. To Macduff, thane of Fife, who contributed to the overthrow of Macbeth, and to his descendants, was given by Malcom Kenmore, on the recovery of the throne of his ancestors, the privilege for any one of the clan Macduff who committed unpremeditated homicide, to have his punishment remitted for a fine, payable to the injured family, if he could get safe to Macduff's cross, which stood in Fifeshire. Many similar privileges were granted by charter in Scotland. To this day, Holyrood palace, as an ancient royal residence, continues to retain this right with respect to the persons of debtors. The boundaries of this place of refuge are liberal; the debtors find lodgings in a short street, the privileged part of which is divided from the unprivileged by a gutter running across it. This is the only existing sanctuary in the British empire. In the United States of America, no civil or ecclesiastical asylum ever existed. The right of asylum endured longest in Italy, and was first put an end to by the French occupation at the end of the last century. The houses of the clergy and graveyards became asylums in Italy in course of time; and the houses of the cardinals at Rome had this privilege, at least in theory, as long as the temporal power lasted.

ASYMPTOTE, a line (straight or curved) tangent to a curve, but having its point of contact with the curve at an infinite distance. If a weight were hung upon a cord, the ends of which were fastened to pins at unequal heights, the weight would slide to a point nearer the lower pin. Let now the cord gradually yield to the weight, and be stretched to an indefinite length, the weight, sliding constantly toward the middle of the cord, would move in a curve; and a vertical line midway between the pins would be an asymptote to that curve.

ATACAMA. I. A S. W. department of Bolivia, bounded by Peru, the Bolivian department of Potosi, the Argentine Confederation, Chili, and the Pacific ocean; area, about 70,000 sq. m.; pop. about 8,000. The greater portion of the department is a dry sandy desert entirely uninhabited, which is supposed to have been for ages the burial place of the aboriginal Peruvians. There are a few fertile valleys in the north. Anhydrous sulphate of soda is abundant in almost every part of the department, and large masses of solid iron have also been found in different localities. Gold, silver, copper, salt, and alum are also among the mineral productions. The capital is Cobija, or Puerto de la Mar, the only seaport which Bolivia possesses. II. The most northern province of

Chili, including the portion of the desert of Atacama lying S. of the preceding department, the separating line being the parallel of lat. 24° S., according to the treaty of 1866, and bounded E. by the Argentine Confederation, S. by the province of Coquimbo, and W. by the Pacific; area, about 88,000 sq. m.; pop. in 1868, 81,615. The province is divided into the departments of Caldera, Copiapo, Freirina, and Vallemar. It abounds in mineral wealth, including perhaps the richest silver and copper mines in the world. Of the former it has 247 and of the latter 994 which are now worked. The silver mines were discovered as lately as 1832, by a shepherd, Juan Godoy, and they have yielded since then ores to the value of over \$100,000,000, fully one third of which amount has been derived from the mines of Chafarcillo. A village of over 1,500 inhabitants, which contains a free school, a church, a hospital, and a post office, now marks the spot of the discovery, and is named Juan Godoy. It is situated on the Chafarcillo hills, 51 m. S. E. of Copiapo, the capital of the department, with which city it is connected by railroad. Within a circuit of 25 leagues from Copiapo are 19 silver-mining districts, of which those of Chafarcillo, Tres Puntas, and Agua Amarga are the most important. The metal is found in a variety of combinations, of which sulphurets, chlorides, and chloro-bromides are the most important. A railway 101 m. long, the first ever built in South America (1850), connects the port of Caldera, one of the best on the whole coast of Chili, with Copiapo and with the mining districts further east.

ATAHUALLPA, or *Atabalpa*, inca of Peru at the time of the invasion of the Spaniards, died Aug. 29, 1533. He was the son of Huayna Capac. The laws of Peru required that the principal wives of the incas should be blood relations, and that no children of other parentage should be legitimate. Atahualpa's mother had been a princess of Quito; nevertheless, at the request of his father, the heir to the throne, Huascar, consented to divide the kingdom with Atahualpa, on condition only that he should render homage to him, and not make conquests beyond his own dominions. This liberal conduct was infamously requited by Atahualpa, who, having secretly got together a large army, attacked Huascar in Cuzco, took him prisoner, loaded him with chains, and exterminated all his adherents, putting his family and immediate dependants to death in the most atrocious tortures. Such is the story told by Spanish annalists, whose testimony is doubtful, seeing that the murder of Huascar, their pseudo-ally, and the tyranny of Atahualpa were among the causes of his own execution. Pizarro and his followers were now in Peru, and Atahualpa opened negotiations with them. His proposals were received in a friendly manner by Pizarro, and an interview was arranged (1532), which Atahualpa attended, followed by a very large

number of unarmed subjects. Father Vicente de Valverde explained to him, through an interpreter, the mysteries of religion, and that on account of their heathenism the pope had granted his kingdom to the Spaniards. Atahualpa professed not to understand the tenor of this discourse, and would not resign his kingdom; whereupon a massacre of the assembled crowd was at once commenced by the Spanish soldiers, who seized Atahualpa and threw him into prison. On the arrival of Almagro the cupidity of the adventurers was excited by the magnificent proposals that Atahualpa made for his ransom, and with a desire of seizing the whole it was determined to put him to death. During his imprisonment Atahualpa gave orders for the execution of Huascar, which were obeyed. This was one of the charges against him on the court martial by which he was tried, and being found guilty, he was sentenced to be burned, a penalty commuted for strangulation by the garrote on his accepting baptism at the hands of the priests accompanying the invaders.—See Prescott's "Conquest of Peru," vol. i.

ATALANTA, a mythical personage, a native of Arcadia, or according to a less generally adopted legend, which gives her story with some variations, of Boeotia. She was the daughter of Jasus, who, having prayed to the gods for a son, was displeased at her birth, and as a mark of his displeasure exposed her on the Parthenian mount. Here she was nurtured by a she bear, and grew up to womanhood, retaining her virginity, and becoming the most swift-footed of mortals. She vanquished the Centaurs, who sought to capture her, participated in the Calydonian boar hunt, and engaged in the Pelian games. In course of time her father was reconciled to her; but when he urged her to choose a husband, she insisted that every suitor who aspired to win her should first contend with her in running. If he vanquished her, he was to receive her hand; if vanquished, he was to be put to death. Milanion overcame her by artifice: as he ran he dropped three golden apples, the gift of Venus, which Atalanta delayed to pick up.

ATASCOSA, a S. county of Texas, watered by the San Miguel river and Atascosa creek, branches of the Nueces; area, 1,262 sq. m.; pop. in 1870, 2,915. It is a stock-raising county, and about three fourths of the surface is prairie. The soil is sandy and easy of cultivation; and the climate is particularly healthy. In 1870 the county produced 36,371 bushels of corn, 11,839 of sweet potatoes, and 22,877 lbs. of wool. There were 97,622 cattle, 6,370 horses, 8,187 sheep, and 13,590 hogs. Capital, Pleasanton.

ATAUI, Hawaiian Islands. See KAUAI.

ATAULPHUS, or *Ataulf* (ADOLPHUS), king of the Visigoths, as successor to Alaric (410), to whom his sister was given in marriage, died in 415. He joined Alaric in Italy with an army of Goths and Huns, and aided him in the siege

of Rome. After the death of his brother-in-law, Ataulphus marched into Gaul, carrying with him captive Placidia, the sister of the emperor Honorius. The Gallic provinces of the empire were then in dispute between Jovinus and Honorius. Ataulphus offered to treat with Jovinus, but being repulsed made similar proposals to Honorius, and defeated and slew Jovinus. Honorius, however, would not be reconciled with the abductor of his sister, and Constantius, to whom Placidia had been espoused, harassed the Gothio kingdom, until in 414 the barbarians were compelled to withdraw, burning Bordeaux as they left, and crossing the Pyrenees into Spain. Ataulphus was assassinated by one of his equerries.

ATBARA, the principal eastern affluent of the Nile, rising in Abyssinia. (See NILE, and ABYSSINIA.)

ATCHAFALAYA, a river and bayou of Louisiana, connecting with the Mississippi near the mouth of the Red river, but receiving very little of its waters except in time of flood. Its course is nearly south to Lake Chetimaches or Grand lake, through which it passes, and from which, in a greatly enlarged stream, it discharges itself into Atchafalaya bay. Its name signifies lost river, and it is supposed by geographers to have formed the old bed of the Red river. The Teche and Courtableau are its principal tributaries. Its whole course is about 260 m.

ATCHISON. I. A county forming the N. W. extremity of Missouri, lying along the left bank of the Missouri river, bounded E. by the Nodaway and drained by the Tarkeo and Nishnabotona rivers; area, 675 sq. m.; pop. in 1870, 8,440, of whom 34 were colored. In 1870 the county produced 45,117 bushels of wheat, 1,312,030 of Indian corn, 69,666 of oats, 18,266 lbs. of wool, 127,826 of butter, and 6,110 gallons of wine. Capital, Rockford. II. A N. E. county of Kansas, separated from Missouri by the Missouri river; area, 424 sq. m.; pop. in 1870, 15,507. In 1870 the county produced 123,745 bushels of wheat, 619,447 of Indian corn, 96,012 of oats, 78,721 of potatoes, 23,289 tons of hay, 513,864 lbs. of butter, 207,839 of tobacco, and 201,593 of wool. Building stone is abundant. The central branch of the Union Pacific railroad passes through the county. Capital, Atchison.

ATCHISON, a city of Kansas, capital of Atchison co., situated on the W. bank of the Missouri river, at the extreme point of the "Great Western Bend," about 25 m. above Leavenworth; pop. in 1870, 7,054. It is an important railway centre, being the terminus of four roads: the Central Branch of the Union Pacific; the Missouri Pacific; the Kansas City, St. Joseph, and Council Bluffs, connecting it with the Hannibal and St. Joseph; and the Atchison and Nebraska. The city contains 5 churches, 9 schools, 3 banks, 2 newspaper offices, a large furniture manufactory, flour mills, and planing mills. The central school building, just com-

pleted at a cost of \$45,000, is one of the finest in the state.

ATCHISON, David E., an American politician, born at Frogtown, Fayette county, Ky., Aug. 11, 1807. He was a lawyer in Clay county, Mo., when he was elected to the state legislature in 1834, and in 1841 was made judge of the circuit court for Platte county. From 1841 to 1855 he was a member of the United States senate, at first acting with the party opposed to the extension of slavery into the northern territories, but suddenly changing his policy in 1849. In 1854 he became prominent in the legislation for the organization of Kansas and Nebraska, advocating the repeal of the Missouri compromise. After the expiration of his term in the senate he became a pro-slavery leader in the conflict on and near the Kansas border in 1856-'7. Since that time Mr. Atchison has not appeared in public life.

ATE, a Greek deity, daughter of Eris or of Zeus. In the tragic poets she is the punisher of those who perpetrate crime; in the epic she is the instigator of gods and men to deeds which superinduce misfortunes. In this character she persuaded Jupiter to take an oath, which afterward enabled Juno to transfer to Eurystheus the power that had been intended for Hercules. When Jupiter perceived what he had done, he cast Ate from Olympus.

ATELLA, an ancient Oscan town of Campania, midway between Naples and Capua, the inhabitants of which were executed, sold as slaves, or expelled by the Romans in 211 B. C., for having been the first to declare for the Carthaginians after the battle of Cannæ. In the days of Cicero the town had recovered its prosperity, though it was classed by Strabo among the smaller towns of Campania. In early Christian times it became an episcopal see, and continued as such till the 9th century, but was then much dilapidated. In 1080 the inhabitants were removed to the neighboring town of Aversa, near which some remains still exist. Atella is celebrated in Roman literature through the *Atellanæ fabulæ*, also called *ludi Osci*, farces or comedies in the Oscan dialect. They were at one time highly popular in Rome. No entire play has come down to us.

ATH, or **Æth**, a city of Belgium, in the province of Hainault, on the river Dender, 80 m. W. S. W. of Brussels; pop. in 1866, 8,260. It has a tower built in 1150, a handsome town hall, a college, orphan asylum, &c. It has manufactures of linen, woollen, and cotton fabrics, of hats and gloves, bleaching and dyeing establishments, and breweries; and it is the seat of a considerable trade. It once had fortifications, but they were demolished in 1830.

ATHA BEN HAKEM, or **Alhakem ibn Atta**, surnamed Mokanna (the veiled), a Moslem impostor, born at Merv, Khorasan, killed about 780. He was by trade a fuller. He pretended to be the embodiment of the living spirit of God, and by his knowledge of philosophy and chemistry was enabled to perform wonders

which drew about him a large band of followers. He always wore a veil, declaring that no one could behold his face and live; but the real reason of his doing so is supposed to have been to hide the loss of an eye. The caliph Mahdi having sent an army against him, he shut himself up in the castle of Keh, north of the Oxus, and when no longer able to stand a siege put himself to death. According to some, he set fire to his castle and threw himself into the flames, followed by many of his disciples. Others state that he poisoned himself and his followers; and again others that he threw himself into a cauldron of corrosive acid, in the hope that his complete destruction would follow, causing the belief that he had been removed by divine agency. Mokanna is the hero of Moore's poem, "The Veiled Prophet of Khorassan."

ATHA MELIK, *Ala ed-Din*, a Persian historian and statesman, born in Khorasan about 1227, died at Bagdad in 1282. He enjoyed the favor of the Mongol princes of Persia, and was for many years governor of Bagdad. His history of the Mongols, entitled "Conquest of the World," has been highly valued.

ATHABASCA, or *Athapescow*. I. A lake of British North America, in lat. 59° N., and between lon. 106° and 112° W., about midway between the Rocky mountains and Hudson bay. It is about 20 m. wide from N. to S. and 280 m. long. Forts Chipewyan and Fond du Lac are on its N. shore. At the W. end it receives the Athabasca and Peace rivers, and discharges the Slave river, which flows N. into Great Slave lake, whence there is communication by the Mackenzie river with the Arctic ocean. The Black river issues from its E. extremity, and forms part of the channel through which, by Black, Manito or Wollaston, Deer, and Indian lakes, and the Churchill river, it is connected with Hudson bay. II. A river which rises in the Rocky mountains, near Mt. Brown, in lat. 52° 10' N., lon. 116° 30' W., and has a tortuous N. and N. E. course, receiving the overflow of the Lesser Slave and several other lakes, and entering Athabasca lake. Its length is about 600 m. A shoal several miles in extent is formed by the débris and drift timber which it brings into the lake.

ATHABASCAS, a family of American Indians, comprising two large divisions: one bordering on the Esquimaux in the northwest, and extending from Hudson bay to the Pacific; the other on the Mexican frontier, extending from the gulf of California to Texas, with smaller bands scattered along the Pacific from Cook's inlet to Umpqua river, Oregon. The northern district contains a variety of tribes, the more important being the Tinne (called Chipewyans by the Crees), the Tahkali or Carriers, Sicaunies, Kutchin or Loucheux, Dog Riba, Mauvais Monde, Slaves, Beaver Indians, and Yellow Knives, with the Sursee on the Saskatchewan. Their numbers have not been accurately computed, but are estimated by Kirby

at 32,000. The scattered tribes are the Kenaians or Thaina on Cook's inlet, numbering about 25,000; the Kwahioqua and Tlatskanai, about 100 each, on the Columbia; and the Umpquas, about 400 in number, on the river of that name. These tribes are all represented as timid, mild, and gentle in manner, peaceable and industrious. The southern district includes the sedentary Navajos, who cultivate the soil and weave blankets; the fierce, wandering Apaches, the most troublesome of tribes; and the more quiet Lipans of Texas. These number about 17,000. The name of the family is derived from Lake Athabasca, but the word is taken, not from their language, but from the Cree, meaning cords of hay according to some. They are easily distinguished from other families, having square massive heads, short hands and feet, and a quantity of beard quite unusual in American tribes. They profess to have come from a distant country in the west, over a series of islands amid ice and snow. Some writers trace strong Tartar resemblances in them, and Turner found curious analogies between their language and that of Thibet.

ATHALIAH, queen of Judah, daughter of Ahab, king of Israel. She was sought by Jehoshaphat, king of Judah, in marriage for his son Jehoram. This marriage was the occasion of the introduction of idolatry into Judah, and of an interruption in the Judean dynasty. After the death of Jehoram, and the short reign and destruction of her son Ahaziah (884 B. C.), Athaliah caused all the male members of the royal line, as she supposed, to be slain, and mounted the throne of Judah herself. But after she had reigned six years, the high priest Jehoiada produced her grandson, the young Joash, who had been saved from the massacre and reared in the temple, caused him to be anointed as king, and ordered the punishment of Athaliah by the armed Levites.

ATHAMAS, in Greek legendary history, a son of Æolus, married Nephele, who, discovering that he preferred Ino, the daughter of Cadmus, vanished from the earth. Ino endeavored to destroy Phrixus and Helle, his children by Nephele, but they were rescued by their mother and transported to Colchis on the back of the ram with the golden fleece. Juno, to punish the infidelity of Athamas, afflicted him with madness. While in this condition he killed Learchus, one of his sons by Ino, and the latter cast herself into the sea with her other son, Melicertes. Athamas now fled from Boeotia, and was commanded by an oracle to remain wherever he should be hospitably received by savage beasts. After much wandering he arrived at a place where wolves were devouring sheep; they fled at his approach, and left their prey at his disposal. Athamas settled there, and called his new territory Athamania.

ATHANASIAN CREED, a symbol chiefly composed of precise theological definitions of the doctrines of the Trinity and incarnation. The

first notices of it are from the 7th century, and do not mention the author. It made its appearance first in France, in the Latin language, became generally known throughout the West, and was adopted last of all in the East. The Greek writers immediately succeeding St. Athanasius make no mention of it. In the MS. editions of his works it is usually not found at all, or, if it is, with the remark, "commonly" or "incorrectly ascribed to St. Athanasius." Subsequently, however, it was ascribed to him by all ecclesiastical writers. Durandus (1287) states that it was composed by St. Athanasius at Treves during his exile in the West, and Mayer thinks this account not improbable. Modern critics generally suppose that it was drawn up as a summary of the doctrine of St. Athanasius, from which circumstance it obtained the name of Athanasian creed, and in process of time was attributed to the great Alexandrian doctor. It has been attributed, on conjectural grounds, to Hilary of Arles and Venantius Fortunatus, to Vincent of Lerins, and to Vigilius, bishop of Thapsus in Africa. This creed is an authoritative formulary of faith in the Roman and Greek churches. Its authority does not rest on the presumption that it was composed by St. Athanasius, but on its general acceptance as a correct enunciation of Catholic faith. In the Roman Catholic church it is recited at the office of prime on Sundays, when the office is dominical. In the church of England it is accepted as of equal authority with the Apostles' and Nicene creeds, and ordered to be recited on certain festivals at the morning prayer. In the 39 articles of the Protestant Episcopal church of the United States all mention of it is omitted, and the creed itself has no place in the prayer book.

ATHANASIUS, *Saint*, patriarch of Alexandria and doctor of the eastern church, died there in 373. He was born at Alexandria about 296, of Christian parents, was educated under the direction of Alexander, afterward bishop of the city, and spent some time in the desert as a disciple of the hermit St. Anthony. At the age of 23 he received deacon's orders, and in the discharge of his office so signalized himself as a foe to every kind of heresy, that he was chosen by Alexander to accompany him to the council of Nice (325). To the subtlety, learning, and eloquence of Athanasius in that council was principally attributed the condemnation of Arianism. His bearing on this occasion, not less than the dying request of Alexander, secured his election as bishop of Alexandria in 326. His uncompromising orthodoxy subjected him to bitter persecution from the adherents of Arius. The emperor Constantine summoned him before a synod at Tyre in 335 and declared him deposed. A synod at Jerusalem the next year confirmed this sentence and banished him to Treves. Constantius recalled him in 338. An Arian council at Antioch condemned him again in 341; but a larger orthodox council at Alexandria sustained him, and another at Sar-

dis, with the Roman bishop at its head, replaced him in his episcopal chair in 349. Deposed for a third time, through the influence of Constantine, by the synods of Arles (353) and Milan (355), he was dragged from the altar by a band of soldiers, and fled into the desert with a price upon his head. Under Julian the Apostate he was again exiled, and spent some time in the wilderness of the Thebaid; and under Valens he suffered his fifth banishment, concealing himself four months in his father's tomb. He was finally restored to his see and died in peace. His festival is kept in both the Greek and Latin churches on May 2, and in the Greek church also on Jan. 18.—The life of Athanasius has historical importance mainly from its connection with the Arian controversy, and the establishment and defence of the Nicene creed. With the exception of his "Discourse against the Pagans" and his treatise on "The Incarnation," all his writings have a direct bearing upon Arianism. His style has the merits of strength, clearness, conciseness of expression, and exact logical order. It is praised even by Erasmus, the most fastidious of critics, above the style of Chrysostom and Gregory. What it lacks of finished grace it makes up in nervous vigor. Bold, unbending, confident even to dogmatism, severe against what he believed to be heresy, suspicious of the promises and professions of all who were not friends of the truth, he was yet courteous, kind to the poor, pious, just, and patient. The best edition of his works is that of Paris, 1627-'8, 8 vols. folio.

ATHELING. See **ANGLO-SAXONS**.

ATHELNEY, *Isle of*, a tract of about 100 acres in Somersetshire, England, 7 m. S. E. of Bridgewater. In the time of Alfred the Great it was an island at the junction of the Tone and Parret rivers. Alfred concealed himself among its marshes during the Danish invasion, and afterward founded an abbey there, about 888.

ATHELSTAN, the first who called himself king of the English, born about 895, died at Gloucester, Oct. 25, 941. He was a grandson of Alfred the Great, and illegitimate son of Edward the Elder; but as the only legitimate son of Edward who was of age died a few days after the death of his father, Athelstan was preferred by the witenagemote to his legitimate brothers, who were under age, and he was crowned king of the Anglo-Saxons at Kingston on the Thames in 925. He annexed the territory of Cornwall and Devon, and exacted tribute from Howel Dda, pendragon of Wales. When Sigtric, king of Northumbria, died, Athelstan seized upon his territory also. Aulaf, the son of Sigtric, obtained the assistance of the Danes and Norwegians, and was aided also by the Irish, Scots, and Welsh, who saw with dislike the increase of the power of the South Saxon king; but Athelstan signally defeated the allies at Brunenburg or Brunbury in Northumbria. After this event Athelstan enjoyed great consideration on the continent of Europe. His sisters were given in marriage

to the king of France, the emperor of Germany, and a Norse king. He was succeeded by his brother Edmund. Athelstan added much to the code left by Alfred. One of his decrees was, that any merchant who made three voyages on his own account beyond the British channel, or narrow seas, should be entitled to the privileges of a thane. He favored learning, built monasteries, collected books, and encouraged the translation of the Scriptures into the vernacular. Two of his books are believed to be extant among the Cottonian manuscripts in the British museum.

ATHENA. See MINERVA.

ATHENÆUS, a Greek writer of the early part of the 3d century of the Christian era, born at Naucratis in Egypt. He is chiefly known as the author of the *Deipnosophista* ("Banquet of the Learned"), a voluminous work of imaginary table talk on almost every conceivable subject, especially gastronomy, between certain learned men while enjoying themselves at supper in the house of an imaginary Roman named Laurentius, with Galen the physician and Ulpian the jurist among the guests. It consisted of 15 books, but only the 1st and 2d, and parts of the 3d, 11th, and 15th, are now extant in an epitome, of which we know neither the date nor the compiler. Notwithstanding its many literary and artistic defects, the great mass of information which it contains, and the light which it throws on the manners of the ancients, will ever cause the *Deipnosophista* to be prized by the scholar and the antiquary. The best edition of this work is that of Dindorf (3 vols. 8vo, Leipsic, 1827).

ATHENAGORAS, a Greek philosopher of the 2d century, who became a convert to Christianity, and flourished probably in the reigns of Marcus Aurelius and his son Commodus. It is said that he was a native of Athens, and first master of the catechetical school at Alexandria. Intending to write against the Christians, he applied himself to the study of the Scriptures, became convinced of their truth, and addressed an apology to one of the emperors in behalf of the Christians. He also wrote a treatise in defence of the doctrine of the resurrection. These works of Athenagoras are still extant. Their style is Attic and elegant. The best edition is that of the Benedictines (Paris, 1742).

ATHENS (Gr. *Ἀθήναι*), anciently the principal city of Attica, and now the capital of the kingdom of Greece, situated in lat. 37° 56' N., lon. 23° 44' E., about 4 m. from the E. coast of the Saronic gulf, and 4½ m. from the port town of Piræus. It was built round a central rocky height, called the Acropolis, an elevation about 800 ft. above the average level of the town, and 600 ft. above the Mediterranean. Grouped near it are several smaller elevations, with valleys between. N. W. of the Acropolis is a moderate height on which stands the temple of Theseus. At a short distance from the N. W. angle is the Areopagus; and over against

the Areopagus is the hill of the Pnyx, with the hill of the Nymphs a little north, and the Museum, or hill of the Muses, at a short distance to the south. N. E. of the city rises the conical hill of Lycabettus. The plain itself in which the city stands is bounded N. by Mt. Parneæ, which separates it from Bœotia; N. E. by Mt. Pentelicus; S. E. by Mt. Hymettus, which descends to the sea; S. W. and W. by the Saronic gulf; and N. W. by Mt. Ægaleos. —A sketch of the history of Athens is necessary to the understanding of any description either of the ancient or modern city. No doubt a stronghold on the rock, afterward called the Acropolis, was the germ from which it grew. When or by whom this was founded is unknown. According to the legends, Cecrops, sometimes represented as an Egyptian settler, sometimes as an autochthonous Pelasgian hero, first took possession of the rock, which from him was called Cecropia. He was succeeded by a line of 16 kings, bearing the names of Cranaus, Amphictyon, Erechtheus I. or Erichthonius, Pandion I., Erechtheus II., Cecrops II., Pandion II., Ægeus, Theseus, Menestheus, Demophon, Oxyntes, Aphidas, Thymætes, Melanthus, and Codrus. In the reign of the second or third king the city is said to have received its name from the goddess Athena (Minerva). Erechtheus is said to have built a temple to Athena on the Acropolis, where he placed the statue of the goddess, made of olive wood. The temple was called, from this legend, the Erechtheum. Theseus is said to have united the 12 communities, or cities, into which Attica was hitherto divided, into one political body. Menestheus led the 50 dark ships of the Athenians in the Trojan war, and is pronounced by Homer the first of warriors, except Nestor. The 17th and last king of Athens was Codrus, who sacrificed himself for his country in a war with the Peloponnesian invaders, who, according to an oracle, were to be victorious if they did not slay the king of the Athenians. After him no one, so the legend says, was permitted to bear the title of king. His son Medon succeeded him under the name of archon, or ruler, holding the office, however, upon the hereditary principle, and for life. A line of life archons continued to rule through 12 reigns, Alcmaeon being the last. During the government of his predecessor, Æschylus, commenced the era of the Olympic games, celebrated at intervals of four years, at Olympia in Elis. This date—the earliest fixed point in Greek chronology—has been satisfactorily established at 776 B. C. After Alcmaeon, a series of seven decennial archons carried on the government till 683, when the office was made annual, its various functions were distributed among nine colleagues, and the right of election was extended to the entire class of the *cupatridæ* or nobles. One of these, the head of the college, bore the title of "the archon," and was designated as the *eponymus*—a magistrate in whose name the transactions of the year were dated and

recorded. The office of archon lasted until long after the independent political existence of Athens and Greece had come to an end. The only important political body existing in Athens at the time of the first appointment of life archons was the senate or council of the Areopagus, which appears to have been in its earliest constitution the representative of the Homeric *boule*, and until the time of Solon was called simply the *boule*, or senate. In the course of time the oppressions and abuses of the eupatridæ gave rise to popular discontents, and Draco was appointed in 624 to draw up a code of written laws. He made no change in the political forms, but merely attempted to introduce a code the severity of which made it impossible to execute it. Twelve years after Draco's legislation Cylon, a member of the eupatrid order, attempted to usurp the supreme power of the state, but failed. Cylon escaped, and his partisans, who had taken refuge, some at the altar of Athena, others at the altar of the Eumenides, were put to death by the direction of Megacles, the representative of the house of the Alcmaeonidæ. This act was supposed to have brought upon that race the curse of the gods, and they were expelled from the city in 597. Epimenides, the Cretan sage, was invited to purify the city from the pollution of sacrilege by expiatory rites. His visit is placed in 596.—The glory of Athens as a political commonwealth dates from the age of Solon, a lineal descendant of King Codrus, born about 638 B. C. At a time of great political disturbance, resulting in part from the oppressions of the eupatridæ, he was chosen archon in 594, and vested with unlimited power to make any changes that might seem necessary in the constitution of the state. He framed a new constitution, changing the title to political power from birth to property. He divided the citizens into four classes: 1. The *pentecostomedimni*, or those whose annual revenue was equal to 500 medimni of corn and upward. 2. The *hippeis*, or knights, whose income ranged between 300 and 500 medimni, and who were sufficiently wealthy to furnish a war horse. 3. The *zeugitæ*, whose income ranged between 200 and 300 medimni, and who were able to keep a yoke of oxen. 4. The *thetes*, whose income fell short of 200 medimni. The 4th class were exempt from taxation and excluded from public office, but they served as light troops in the army. Only the first class were eligible to the higher offices of the state; the 2d and 3d classes filled the inferior offices; the 2d class served in the army as horsemen, and the 3d as heavy-armed foot soldiers. All classes had the right of voting in the public assembly, which elected the archons and other magistrates. He established another legislative body, called the senate or council of the four hundred, elected by the assembly, 100 being taken from each of the four ancient tribes, into which the people were divided long before Solon. The court of the Areopagus was endowed

with enlarged powers, and with the general supervision of the conduct and lives of the citizens and the institutions of the state. Solon's kinsman Pisistratus made himself master of Athens in 560, adorned the city with many public works, collected a public library, and called around him the most distinguished poets, artists, and scholars from every part of Greece. He died in 527, and was succeeded by his two sons, Hippias and Hipparchus. By the conspiracy of Harmodius and Aristogiton, Hipparchus was slain in 514, and Hippias was compelled to quit Athens for Asia in 510. Clisthenes and Isagoras were now rivals for power, and the constitution of Solon went for a time into full operation; but Clisthenes soon reorganized the people of Attica by dividing them into ten tribes, instead of the old Ionic four tribes; and these ten tribes were local, and were subdivided into districts or townships called *demes* (*δῆμοι*). It was customary to designate every citizen by affixing to his name the epithet indicating the deme to which he belonged. The senate was also changed, and its powers and duties were greatly increased; it now consisted of 500 members, 50 being taken from each tribe. The general control exercised by the people over the affairs of government, through the *ecclesia*, was also greatly enlarged. The judicial powers of the people were regulated by the establishment of the heliastic courts, of which ten were organized, either by Clisthenes, or soon after his time. The new arrangement of the tribes led to a new arrangement of the military service, the administration of which was placed in the hands of ten generals, one being chosen from each tribe. With them was associated, however, the polemarch, or third archon, who under the old constitution held the exclusive military command. The ostracism was also introduced by Clisthenes.—The prosperity of Athens excited the jealousy of the Spartans, who soon made several attempts to overthrow the growing democracy. Their first plan was to establish Isagoras, the rival of Clisthenes, as tyrant of Athens; but the expedition set on foot for the purpose failed. They next planned the restoration of the exiled Hippias; and thus began that series of events which resulted in the Persian invasions of Greece, in repelling which the Athenians, under their generals Miltiades, Themistocles, and Aristides, took so conspicuous a part. The history of Athens in this struggle is completely identified with that of Greece until the battle of Platæa, in 479, when the Persians were finally vanquished. The conduct of the Athenians in meeting the invaders had given Athens the leadership of the country; and this was now acknowledged in the formation of the so-called confederacy of Delos, a union of numerous states under the Athenian hegemony. The rebuilding of Athens on a larger scale, and with stronger defences, excited the jealousy of the Æginetans and the Spartans, and attempts were made to interfere.

These were frustrated by the policy of Themistocles. The city was surrounded by massive walls, the fleet was increased, and the harbors of Piræus and Munychia were fortified with walls and towers, vast ruins of which remain to this day.—The progress of Athens in letters and arts in the time of her hegemony was wonderful; but her most brilliant period was that of Pericles, who came forward as a popular leader in 469. With slight interruptions, his administration lasted from 469 till his death in 429, though he held no permanent office. The names of Æschylus, Sophocles, Euripides, and Aristophanes in dramatic poetry, of Phidias and his school in plastic art, and of Anaxagoras and Socrates in philosophy, are connected with this period. The treasury of Delos was removed to Athens, and the amount of contributions increased beyond the assessment of Aristides. Public buildings of extraordinary splendor were erected. The great structures of the Periclean age were the Odeon, finished in 444; the Parthenon, 387; the Propylæa, 432; and the Erechtheum, which was not quite completed at the breaking out of the Peloponnesian war. This magnificent system of public works was under the general superintendence of the sculptor Phidias. The architects of the Parthenon were Ictinus and Callicrates. Mnesicles was the builder of the Propylæa.—The Peloponnesian war broke out in 431. The Lacedæmonian troops ravaged the plain of Athens, and the inhabitants of the country crowded into the city. In the next year a second invasion took place, and the plague carried off not less than a fourth of the inhabitants. The disasters in the field were accompanied by violent changes in the city. (See GREECE.) After the defeat of the Athenians at Ægospotami and the surrender of the city in 404 to the Spartan general Lysander, the democracy, which had been restored, was again abolished, and a government of thirty established, under the control of Sparta, known in history as the thirty tyrants. The walls of Athens were demolished by the Lacedæmonians, and the arsenals and docks at Piræus destroyed. The Spartan rule was overthrown by a body of exiles, headed by Thrasybulus, who restored the reign of the ancient laws. But Athens never regained her leadership in Greece.—The period between 403 and 360 B. C., usually designated as that of the Spartan and Theban supremacy, is signalized by the adventures of Xenophon, the Athenian, in the expedition of Cyrus the Younger, and the retreat of the 10,000; the war of the Lacedæmonians, under Agesilaus, in Asia Minor; the Corinthian war; the peace negotiated by Antalcidas and bearing his name in history, 387; the partial reorganization of the Athenian confederacy on the basis of the confederacy of Delos; and by numerous distant expeditions, both by the Lacedæmonians and the Athenians. In 361 a general peace was concluded by consent of all

parties except the Lacedæmonians; but in the following year the Athenians went to war with the Olynthians for the possession of Amphipolis, and this war brought them into collision with Macedonia under the lead of Philip, and after his death under that of his son Alexander. As the Macedonian successes increased, a party grew up in Athens which favored a conciliation of the conquerors. Until the death of Philip and the accession of Alexander, Demosthenes and the true Athenian patriots of his school were able to make a vigorous opposition to this movement; but when Alexander destroyed Thebes, and the Athenians could only protect themselves against him by almost complete submission, the Macedonian party triumphed, and in spite of the efforts of the great orator Athens sank into entire subjection to the invaders. A tranquil period, one of the most inglorious in the political history of the city, now ensued. When the news of Alexander's death arrived (323), a fresh attempt was made to overturn the Macedonian supremacy. Leosthenes, the Athenian, defeated the army of Antipater, the Macedonian general, at Lamia, a short distance N. of the pass of Thermopylæ; but the defeat of the Greek forces at Crannon in Thessaly once more placed the Macedonians in the ascendant. The Lamian war closed with the unconditional surrender of Athens to Antipater. From this time Athens became the victim of the contending chiefs of Macedonia. Demetrius Phalereus ruled the city ten years, supported by a Macedonian garrison; but in 307 Demetrius Poliorcetes was sent from Ephesus by his father, and compelled his namesake, the Phalerean, to surrender the city. The conqueror announced to the people the restoration of their ancient constitution, and was the object of extraordinary honors, though he did nothing to really elevate Athens, and his rule only added to her degradation. Athens continued under the Macedonian influence down to the conquest of Greece by the Romans, though nominally governed by her own laws, and preserving her ancient customs, rites, and ceremonies of every description. In 200 the last Philip of Macedon was involved in a war with Rome, and Athens, having taken sides with the Romans, suffered from his barbarism. The city was relieved by a Roman fleet; but before Philip withdrew from the siege he laid waste the gardens and suburbs, including the lyceum and the tombs of the Attic heroes, and destroyed the temples that stood on the Attic plain. Philip was defeated at the battle of Cynoscephalæ in 197, and in the following year Greece was declared free by the Roman consul Flamininus, at the Isthmian games. War was renewed by Perseus, and the Macedonian empire was finally overthrown by Lucius Æmilius Paulus in 168. In 147 war broke out between the Achæan league and Rome, but it was closed with the capture and sack of Corinth by the consul Mummius in the following year,

which saw the whole of Greece reduced to a Roman province, under the name of Achaia.—Under the Romans Athens was prosperous and respected. Her schools of eloquence and philosophy were open to the civilized world, and the sons of distinguished Roman citizens were sent there to complete their education. Her splendid temples remained uninjured; the magnificence of the city had been increased by the liberality of foreign potentates. Athens occasionally suffered during the civil wars. She took part with Mithridates, and was besieged and captured by Sulla, who destroyed the long walls and the fortifications, annihilated the commerce of Piræus, and left the city crippled in all her resources. The groves of the academy and the lyceum were cut down, and columns were carried off from the temple of Olympian Zeus to adorn some public building at Rome. The establishment of the empire made but little difference in the condition of Athens, and she continued the centre of the world of literature and art down to the commencement of the Christian era. St. Paul visited the city, and delivered his discourse on Mars Hill, probably about the middle of the 1st century. The emperor Hadrian, in the first part of the 2d century, finished the temple of Olympian Zeus, established a public library, and built a pantheon and gymnasium. Marcus Aurelius increased the number of the Athenian schools and the salaries of the teachers. About the middle of the 3d century the Goths, crossing the Hellespont and Ægean, descended upon Attica. Athens made a brave defence under the inspiration of the scholar and philosopher Dexippus, and suffered but little from the invasion before the enemy were driven back. In A. D. 258, a few years before the arrival of the Goths, the walls, which had been in a ruinous condition since the siege of Sylla, were repaired by Valerian. In 396 Alaric advanced upon Athens; but, not willing to undergo the delay of a siege, he accepted the hospitalities of the magistrates, and retired, leaving the city and Attica unharmed. For more than 100 years after this Athens enjoyed great prosperity as the chief seat of learning and culture; and we hear of her principally through the many learned men of the time who received their education in the city.—In the 5th century the beautiful Athenais, daughter of the Athenian philosopher Leontius, became a Christian, was baptized at Constantinople under the name of Eudocia, married the emperor Theodosius II., and did much by the influence of her example, and by building churches, to promote Christianity in Athens, the local government having recently authorized, by direction of an imperial rescript, the public recognition of Christianity there. The temple of Olympian Zeus was consecrated to Christ the Saviour; the Parthenon to the Holy Wisdom (St. Sophia), afterward changing the designation to the Panagia and the Mother of God; and the temple of Theseus

to St. George of Cappadocia. After Justinian in the 6th century had broken up the schools, we scarcely hear of the city for nearly 400 years.—In the 12th century Athens was taken and plundered by Roger, king of Sicily. The fourth crusade again brought the name of Athens to the notice of Europe. Greece was parcelled out among the Frankish princes after the capture of Constantinople in 1204. Otho de la Roche was made duke of Athens in 1205, and four successors of his family held the dukedom till 1308. Walter de Brienne succeeded, and was overthrown by the Grand Catalan company, whose aid he had invoked. A duke of the Sicilian branch of the house of Aragon was invested with the dignity by the Catalans, and in this line the dukedom remained till near the end of the 14th century. Six dukes of the Florentine family of Acciajuoli followed, ruling Athens till 1456. The ducal court of Athens was one of the most brilliant in Europe. In 1456, when it was captured by Mohammed II., Athens appears to have been prosperous, and the number of its inhabitants is said to have exceeded 50,000. In 1467 the Venetians went to war with the Turks, and, invading Greece with a powerful fleet, landed at Piræus, and expelled the Turks from Athens after a bloody battle. Athens remained under the Venetians till 1470, when the sultan entered Greece with a large army and retook the city. He placed Athens under a waywode, who held his office from the chief eunuch of the harem. The external affairs of the city were managed by the waywode; a *cadi*, or judge, decided the controversies between the Ottomans, without interfering in those of the Christians. The garrison on the Acropolis was under the command of the Turkish *disdar*. The proper municipal affairs of the city were managed by magistrates elected from the principal families by the people, and called by the ancient name of archons. This form of administration remained unchanged from 1470 to 1687. In the latter year Morosini, the Venetian admiral, having gained brilliant victories in the war between the republic and Turkey, captured Athens, and obliged most of the Turks to leave the city. But an epidemic sickness and a fresh muster of the Turks compelled him to withdraw in March, 1688. A large number of the citizens fled, some to Salamis, Ægina, and other islands, some to Corinth, some to Nauplia, and others to Oephalonia. The city remained deserted till the following year, when the Turks entered it and committed a large part of the houses to the flames. The Athenians, however, began gradually to return. The sultan granted them a free pardon, and remitted the tribute for three years. From 1690 to 1754 the Athenians lived quietly, under a political organization essentially the same as that already described. Between 1754 and 1777 Athens was frequently harassed by Albanian incursions. In the latter year a battle was

fought at Calandria, near Athens, by the Athenian Turks and Greeks, under the waywode, named Chaseskes, against these barbarians, commanded by the deli pasha, and a decisive victory gained. In 1778 Chaseskes fortified Athens with a wall, using materials taken from many of the ancient structures. The conduct of Chaseskes gained him so much popularity, that his reappointment was solicited and obtained of the Porte, and finally he was appointed waywode for life. Having secured his end, he threw off the mask, and showed himself to be a tyrant. The tide of popular feeling turned against him, and he was banished; but by intrigue and bribery he was again restored. The contest continued 22 years, during which the game was repeated five times; and finally, in 1795, he was beheaded in Cos, the place of his exile. In this period the prosperity of Athens declined. Her population and wealth greatly diminished. A pestilence ravaged the city in 1789 and again in 1792; about 1,200 perished in the former, and 1,000 in the latter. In the movement toward a revival of Greek independence, which distinguished the close of the last century and the beginning of the present, Athens played a prominent part. New schools were established, and the whole influence of all her educational institutions was on the side of Greek freedom. The actual war of independence commenced in 1821. The fortunes of Athens were variously affected during the seven years of its continuance. The Turkish garrison was besieged in the Acropolis April 28, but after many tragical scenes was relieved July 20, and the Greek troops were compelled to retreat by the Turks under Omer Pasha, Briones, and Omer Bey. Many of the inhabitants were slain, and the city was plundered and burned. Many of the Athenians fled to Salamis and Ægina, and some of them joined the troops concentrating at the isthmus of Corinth. In September, 1821, Omer Pasha retired from Athens with the greater part of his forces, and his lieutenant soon afterward with the remainder. The Acropolis was again left in the hands of the resident Turks, and the Athenians, returning from their places of refuge, besieged them, and compelled them to surrender, June 21, 1822, 1,160 prisoners being taken. Before these could be conveyed to a place of safety, a rumor of a new invasion spread through the city, and caused the Athenians such alarm that they fell upon the Turks and put to death about 400, in violation of the terms of the surrender. During the next two years violent dissensions between the Greek leaders delayed the progress of the war; but in spite of the treachery of Odysseus, a leading general, who joined the enemy and made hostile movements against Athens, the body of the troops and citizens faithfully supported Guras, the commander of the city, and finally gained a decisive victory, capturing Odysseus, who was put to death. Early in 1826 the Turkish forces, un-

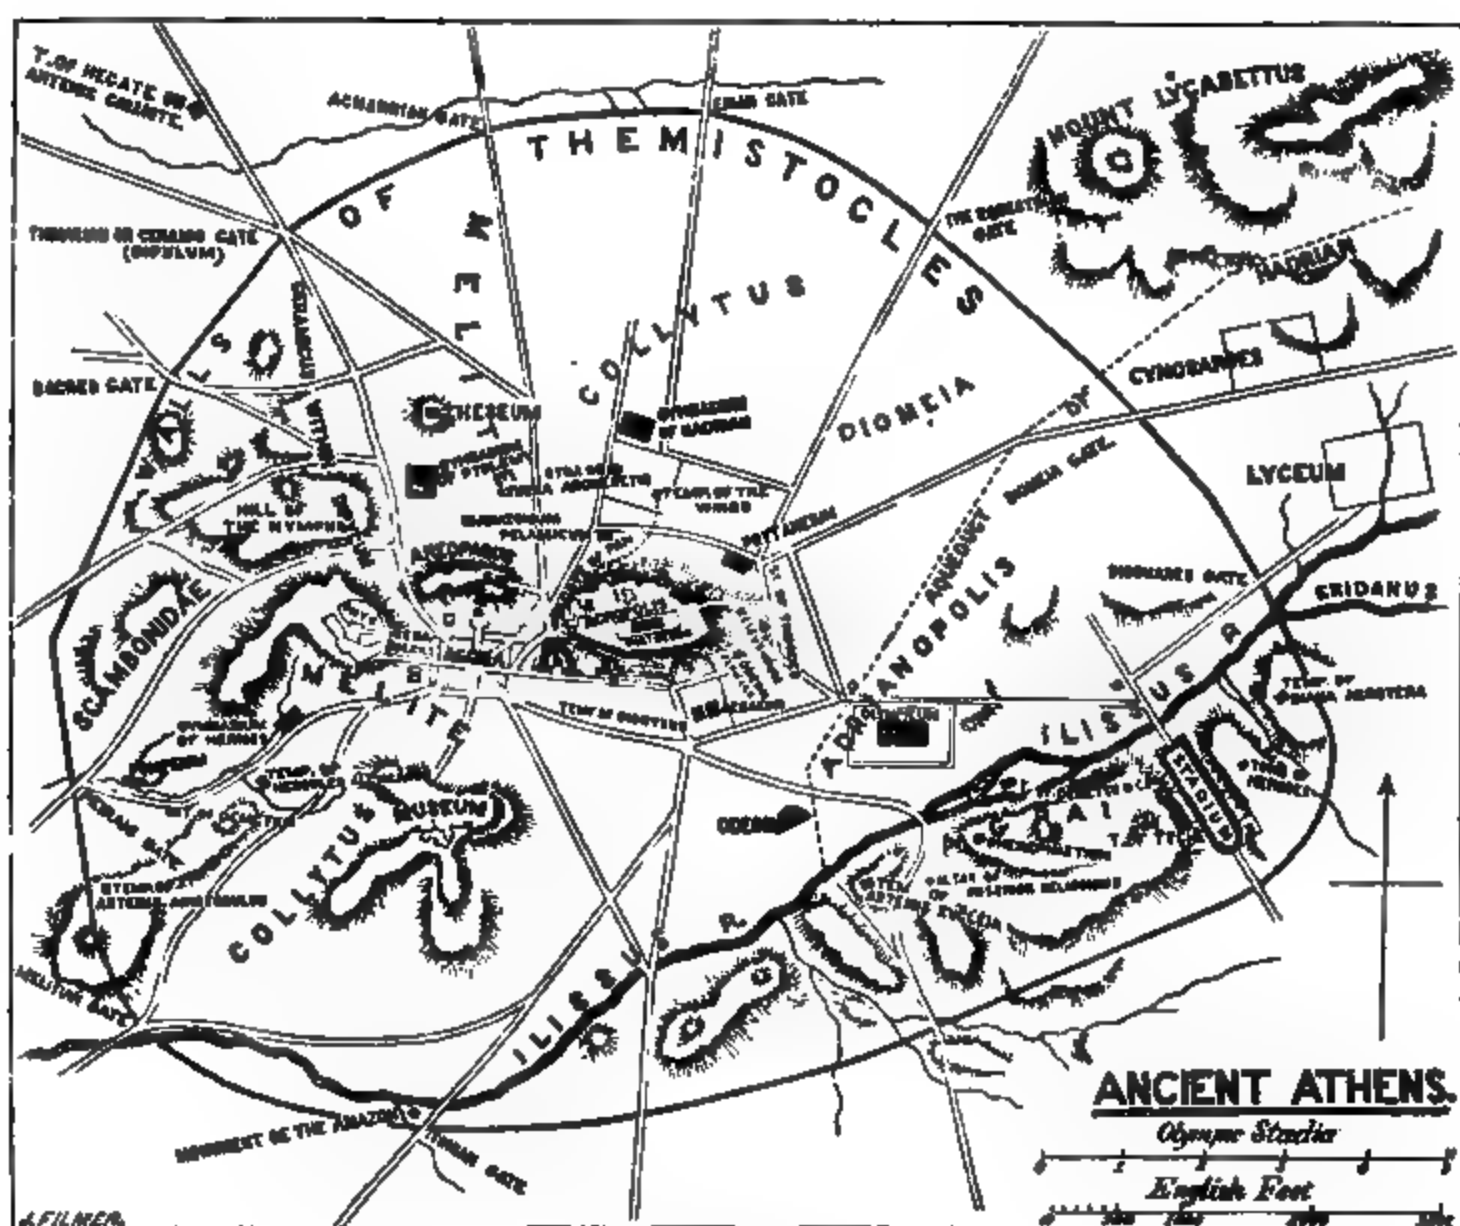

der Kiutahi Pasha and Omer Pasha, overran Attica. Numerous conflicts occurred in the neighborhood of Athens. On Aug. 15 the Turks forced their way into the city, and the Greeks retired into the Acropolis, where they were long besieged, suffering great hardships. Guras was killed in an outwork. During the siege the Greek forces outside the city, under the command of the English Lord Cochrane, Gen. Church, and others, strove to relieve the garrison. In May a bloody and decisive battle was fought, and the Greeks were entirely defeated. Cochrane and Church were compelled to seek refuge on board their ships, and the posts in the neighborhood of Piræus were abandoned. The citadel was compelled to surrender June 5. More than 2,000 men and 500 women were marched down from the Acropolis, and transported to Salamis, Ægina, and Poros. Thus, after a siege of 11 months, Athens was again placed under Turkish domination. The city remained in the possession of the Turks till 1832, when the intervention of the great powers had secured independence to the Greeks under a republican form of government, with President Capo d'Istria at its head. During these last years almost all the modern buildings of the city had been demolished. Scarcely a private dwelling was uninjured, and the remains of antiquity shared in the general calamity. The city recovered slowly, and had little prosperity until subsequent events drew back to it some part of its former population. Capo d'Istria was assassinated in 1831. In August, 1832, Otho, the second son of the king of Bavaria, who had been selected by the great powers, England, France, and Russia, was proclaimed king at Nauplia. He arrived at the end of January, 1833. The king, only 17 years old when he was chosen, attained his majority, which was fixed at 20, in 1835. In that year the seat of government was transferred from Nauplia to Athens, and from this date recommences the history of Athens as a new centre of civilization in that quarter of the world. Its prosperity now quickly revived. A new liberal constitution, drawn up by an assembly convened at the demand of the people, and formally accepted March 16, 1844, made great changes in the government of Greece, of which the city speedily felt the favorable results. Since 1844 there have been few events of importance in the history of Athens. In 1854, during the Crimean war, revolutionary movements having broken out against the Turks, Athens was occupied by a garrison of French and English troops, which was not wholly withdrawn till 1857. In 1854 also the Asiatic cholera visited the city, causing terrible suffering and a very great number of deaths.—Our knowledge of the appearance and topography of ancient Athens is derived from several sources: from the ruins now visible in the modern city, from which almost alone scholars have been able to ascertain the positions of many walls and buildings; from

the casual references and allusions of ancient historians, orators, and dramatists; but most of all from the detailed account of Pausanias, who visited Athens in the time of the Antonines, a period of great splendor. By the aid of these means of information, interpreted and arranged by many eminent scholars—among whom Col. Leake and the German philologist Forchhammer are prominent as having established the principal points almost beyond a doubt—a very accurate idea has been formed of the ancient capital, its fortifications and environs. In describing it, we shall, after a few necessary explanations, follow the route taken by Pausanias, using his descriptions in their order, and filling the gaps left by him with information derivable from other sources.—Athens—that is, all the district lying within the fortifications—consisted of three parts: 1. The Acropolis, often called simply the Polis. 2. The Asty, or upper town, as distinguished from the port towns, and therefore really in-

ed the Asty from the earliest times, the great wall around it, to which we have alluded, was built by Themistocles as soon as possible after the battle of Salamis. The port towns, though also slightly fortified by him, were first regularly walled and laid out under Pericles, by whose advice they were connected with the Asty by the northern long wall and the Phaleric wall. The southern long wall was not built until about the beginning of the Peloponnesian war; the Phaleric wall then became comparatively useless, and was allowed to decay. The position of the gates in the wall of the Asty has been a matter of much doubt. The locations given in the accompanying map are those agreed upon by the best authorities, though many of them are still uncertain.—Pausanias apparently entered the city by the Piræic gate, and his first mention is of the Pompeium, a building used as a depository of certain very valuable sacred vessels (*πομπεία*) when not in use. Here were several statues, among them one of Socrates. Beyond this, in passing toward the Acropolis, were the temples of Demeter (Ceres), Hercules, and several minor deities; then the gymnasium of Hermes (Mercury); all these were on the road leading toward Piræus, and passing between the hills of the Museum and the Pnyx. The former of these, lying on the historian's right, and S. W. of the Acropolis, was a considerable elevation, crowned by a fortress, and probably covered with houses. Upon it was the monument of Philopappus, which still remains in a ruined state. The hill of the Pnyx, the height lying to the left of Pausanias, was one of the famous localities of Athens. Here was the *bema*, or pulpit of stone, from which the great Athenian orators spoke to the assembled people, gathered in a semicircular level area of large extent, which was the Pnyx proper (*Πνύξ*). The *bema* and traces of the levelled area still remain. Beyond the Pnyx, to the northeast, was the Areopagus, or hill of Ares (Mars), on the S. E. summit of which the famous court or council of the Areopagus held its sittings. N. W. of the Pnyx was still another hill, that of the Nymphs. Along the road taken by Pausanias colonnades extended, probably forming the entrances to dwellings in the rear. Pausanias next entered the district of the Asty called the inner Ceramicus (the outer Ceramicus lying outside the walls), at that prominent point of Athens, the Agora, or market place. This was a square surrounded by colonnades, temples, and public buildings, decorated with statues and paintings. On the right, as Pausanias entered it, stood the Stoa Basileus (royal colonnade), in which was held the court of the archon basileus. Upon its roof and near it were numerous statues, which Pausanias describes. Next this stoa was another, the Stoa Eleutherius, decorated with paintings by Euphranor. Near this, again, stood the temple of Apollo Patrons, that of the Mother of the Gods, and the council house of the 500. According to the account of the

Plan of Athens and the Port Towns.

cluding the Acropolis. 3. The port towns, Piræus, Munychia, and Phalerum. The Acropolis was in itself a citadel; the Asty was surrounded by walls; and three similar walls, the two long walls and the Phaleric wall, connected the Asty with the port towns. About the position of these last three there has been little doubt; but the questions concerning the walls of the Asty itself have been matter for controversy. For a long time the views of Col. Leake on this point were considered the true ones; but Forchhammer's theory is now generally adopted as correct. The wall around the Asty measured 60 stadia; that around Piræus (with Munychia) the same; the length of each of the long walls was 40 stadia, and that of the Phaleric wall 35. The walls of Piræus, and probably the others also, were 60 feet in height. Between the long walls, which were 550 feet apart, ran a carriage road from the Asty to Piræus; and this was probably lined with houses, so that the city was continued through the whole distance. Although some kind of fortifications probably surround-

Plan of Ancient Athens.

historian, the Tholus, a circular stone edifice dedicated to the gods, the temple of Aphrodite Pandemna, the altar of the Twelve Gods, and a very great number of statues of gods and heroes, also stood around the market place and on the fourth side were the Stoa Poecile, the temples of Aphrodite Urania and Hephestus, and the Eurysaceum, a temple to the memory of Eurysaces, a son of Ajax. In the Agora was also an enclosure where the votes for ostracism were received. Many of these things are not mentioned until later in the historian's account, for Pausanias now changed his route, passed down the road continuing the street of the Ceramicus on the other side of the Agora and leading to the Ilissus, and only returned to the Agora after describing much of the remainder of the city. Near the end of the long street, which was generally lined with private houses, he found the Odeon, first built for a public theatre, but afterward used as a granary, and near it the Enneacrunus, or fountain of Callirhoe, the only supply of fresh running water in ancient Athens, the rest used by the inhabitants having been drawn from wells. Beyond these were several smaller temples. Returning to the Agora, and describing those parts of it not alluded to before, Pausanias now began a new

excursion, passing up the Ceramicus toward the gate, noticing the gymnasium of Ptolemy

Present Appearance of the Thesaurum.

and the temple of Theseus, or Theseum. This edifice, at this day the best preserved monument of the splendor of ancient Athens, was

a structure of Pentelic marble, a peripteral hexastyle of the Doric order of architecture, 104 ft. long, 45 broad, and 33½ high to the summit of the pediment. Its sides and pediments were adorned with sculptures, some of which remain, though much injured. Many of these, as well as parts of the building, were painted. They set forth incidents in the lives of Theseus and Hercules. Pausanias turns to the right at the Theseum, and visits the temple of the Dioscuri (Castor and Pollux), the Aglaurium or sacred enclosure dedicated to Aglaurus, and the Prytaneum, an edifice in which were deposited the laws of Solon. The Olympieum, S. E. of the Acropolis, was the largest and must have been in some respects the most magnificent of all the Athenian tem-

ples. It was begun by Pisistratus and finished by the emperor Hadrian, so that its construction was continued at intervals through a period of 700 years. It was 350 ft. long, 171 broad, and of great height, surrounded by a peristyle comprising 160 columns, 16 of which remain standing; they are 8 ft. 6 in. in diameter, and more than 60 ft. high. Several minor buildings are next noticed by Pausanias, among them the Pythium and the Delphinium, both temples of Apollo. After visiting certain gardens which appear to have been in this quarter of the city, he describes the Cynosarges and the Lyceum, both outside the walls; the former a place sacred to Hercules, the latter the famous gymnasium in which Aristotle expounded his doctrines. Pausanias returned

along the Pissus, passing several lesser altars and sanctuaries, and his account makes its next important subject the Panathenaic Stadium, a partly natural amphitheatre in the hills, in ancient times furnished with marble seats from which an immense multitude could witness the games below. The terraces of this amphitheatre are still to be traced. The historian returns to the Prytaneum, notices the Choragic Monument of Lysicrates, which still exists, among the most beautiful of the smaller relics of Athenian art, and enters the sacred enclosure of Dionysus, in which stood two temples, and near which was the Dionysiac theatre. Near the theatre, again, stood the Odeon of Pericles, the roof of which is said to have been formed in imitation of the tent of Xerxes. Passing westward along the base of the Acropolis, Pausanias mentions the tomb of Talos, the temple of Æsculapius (Asclepieum), and several other monumental tombs and temples, which were here clustered together.—In

following his description of the Acropolis we are aided by the magnificent ruins still remaining

Ground Plan of the Acropolis.

of the temples that covered its summit, and may safely supply many details of the account. The principal buildings on the summit of the Acropolis were the Propylæa, the Erechtheum, and the Parthenon. The Propylæa served at once as an architectural embellishment and a military defence. Among the ancients it was more admired than even the Parthenon, for the skill with which the difficulties of the ground were overcome, and for the grandeur of the general effect. The approach was a flight of 60 marble steps, and was 70 ft. broad. At the top of the steps was a portico of six fluted Doric columns, 5 ft. in diameter and 29 ft. high. The side wings, on platforms, 78 ft. apart, had three Doric columns *in antis* fronting upon the grand staircase. The north wing contained the Pinacotheca, a hall 35 ft. by 30; the hall of the south wing was 27 ft. by 16. Behind the Doric hexastyle was a magnificent hall 60 ft. broad, 44 deep, and 39 high, with

form of the Erechtheum was oblong, with a portico of six Ionic columns at the east end, and a kind of transept at the west, a portico of four columns on the north, and the portico of the caryatides, standing on a basement 8 ft. high, on the south. At the western end

Ruins of the Propylæa.

a marble ceiling resting on enormous beams, supported by three Ionic columns, on each side of the passage. At the east end of this hall was the wall, through which there were five entrances, with doors or gates. The central opening, through which the Panathenaic procession passed, was 13 ft. wide and 24 ft. high; those next the central are, on each side, 9½ ft. wide, and the smallest 5 ft., the height varying in proportion. These gates were the only public entrance into the Acropolis. Within the wall, on the eastern side, was another hall, 19 ft. deep, its floor elevated about 4½ ft. above the western, and terminated by another Doric portico of six columns. The pediments and ceilings of this structure have been destroyed. Most of the columns remain, some of them entire, with heavy fragments of the architraves. Passing through the Propylæa, one came to the Erechtheum, on the left or north side of the Acropolis, and the Parthenon on the right, near the southern or Cimonian wall. The

Portico of the Erechtheum, with Caryatides.

there is a basement, on which are four Ionic columns half engaged in the wall, and supporting a pediment. The eastern and western divisions of the temple are on different levels, the eastern being 98 ft. higher than the western. Enough remains of this extraordinary and beautiful temple to give a correct idea of its outward form; but the interior is in so

Ruins of the Erechtheum.

ruinous a condition that the distribution and arrangement of the divisions are subject to the greatest doubt. There remains to be described the Parthenon, the noblest monument in Athens. It was built of Pentellic marble, under the superintendence of Phidias,

by Ictinus and Callicrates. It stands on a basis approached by three steps, each 1 ft. 9 in. high, 2 ft. and about 4 in. wide. Its breadth, on the upper step, is 101.84 ft.; its length, 228 ft.; the height to the top of the pediment from the upper step of the stylobate, 59 ft., and with the stylobate, 64 ft. The temple is Doric, octostyle, or with eight columns at each end, and peripteral, or colonnaded all round, there being 16 columns on each side, not counting those at the corners—48 in all. The length of the *secos*, or body of the temple, is 193 ft., and its breadth 71 ft., omitting fractions. The space between the peristyle and the wall is 9 ft. wide at the sides and 11 ft. at the fronts. The body is divided by a transverse wall into two unequal portions: the eastern was the *naos* proper, an apartment for the statue of the goddess, 98 ft. in length; the western, the *opisthodomos*, which was commonly used as the treasury of the city, 43 ft. long. Within the peristyle, at each end, were eight columns, 33 ft. high, on a stylobate of two steps. Within the *naos* was a range of ten Doric columns on each side, and three at the west end, forming three sides of a quadrangle; above them, an architrave supported an upper range of columns, which Wheeler, at the time of whose visit they were still standing, calls a kind of gallery; 14 ft. distant from the western columns is the pavement of Piræic stone, on which the great chryselephantine statue of Athena was placed. Besides the internal decorations, the outside of the temple was ornamented with three classes of sculpture: 1. The sculptures of the pediments, being independent statues resting upon the deep cornice. The subject of those on the eastern pediment was the birth of Athena; of those on the western, the contest between Poseidon and Athena for the possession of Attica. 2. The groups in the metopes, 92 in number, representing combats of Hercules and Theseus, the Centaurs and Amazons, and perhaps some figures of the Persian war. These groups were executed in high relief. 3. The frieze round the upper border of the cella of the Parthenon contained a representation in low relief of the Panathenæic procession. All these classes of sculpture were in the highest style of the art, executed by Phidias himself, or under his immediate direction. Most of them were in place when Wheeler visited Athens, in 1676; and drawings of the figures in the pediments were made in 1674 by Carrey, a French architect in the suite of the marquis de Nointel, minister of France at the Porte. The interior of the temple was thrown down in 1687, by the explosion of a bomb in the Turkish powder magazine. The front columns of the peristyle escaped, but eight on the north side and six on the south were overthrown. Morosini, in endeavoring to remove some of the figures on the pediments, broke them, and otherwise did great mischief. At the beginning of the present century, Lord Elgin dismantled a considerable part of the

Parthenon of the remaining sculptures, which form the most precious treasures of the British museum at the present moment. A question has been much discussed as to whether any portion of the exterior of the temple was decorated with painting. It is hardly possible to doubt the fact, after a personal examination. Many of the mouldings have traces of beautifully drawn patterns. Under the cornices there are delicate tints of blue and red, and of blue in the triglyphs. Architraves and broader surfaces were tinged with ochre. All these figures were executed so delicately and exquisitely, that it is impossible to accept the theory sometimes advanced of their being the work of subsequent barbarous ages. There are other traces of colors on the inner surface of the portion of the walls still standing, which evidently belong to a period after the stonecutters Eulogius and Apollon converted the Parthenon into a church. Among the inscriptions there is one, found in 1836, containing

Ruins of the Parthenon.

a record of money paid for polychromatic decorations. The Parthenon was built in the best period of architecture, and under the inspiration of the highest genius in art. Its aspect is simple, but scientific investigation has not yet exhausted its beauties and refinements. Unexpected delicacies of construction have not ceased to be discovered in it. In 1837 Pennington, an English traveller, noticed the inclination of the columns. Hofer, Schaubert, and others have examined the subject, and published their observations upon the inclination of the columns and the curved lines of the stylobate and architraves. Mr. Penrose, an English scholar and architect, visited Athens in 1845, and was afterward sent by the society of dilettanti to complete the investigations he had already commenced. The results were published in a splendid folio, in 1851. They may be briefly summed up thus: The lines which in ordinary architecture are straight, in the

Doric temple at Athens are delicate curves. The edges of the steps and the lines of the entablatures are convex curves, lying in vertical planes and nearly parallel, and the curves are conic sections, the middle of the stylobate rising several inches above the extremities. The external lines of the columns are curved also, forming a hyperbolic entasis. The axes of the columns incline inward, so that opposite pairs, if produced sufficiently far, would meet. The spaces of the intercolumniations and the size of the capitals vary slightly, according to their position. From the usual points of view these variations and curves are not perceptible, but they produce by their combination the effect of perfect harmony and regularity; and the absence of these refinements is the cause of the universal failure of buildings constructed in modern times according to what have been supposed to be the principles of Hellenic architecture. This subject is treated by Mr. Penrose in great detail, and with remarkable precision; also by M. Beulé, in *L'Acropole d'Athènes* (Paris, 1853-5).—Besides these famous buildings, there were on the Acropolis others of less size, but great beauty. Such were the temple of Nike Apteros (the Wingless Victory), the remains of which have been discovered and restored, the temple of Rome and Augustus, and the temple of Artemis Brauronia. Among the celebrated statues and works of art on the summit of the Acropolis was the colossal statue of Athena Promachos, which represented the goddess holding a spear and in full armor. It was of such height that it could be seen at a considerable distance from the coast, above the Parthenon and the other highest buildings of the city.—The population of ancient Athens has been a subject of much controversy; but the results reached by different authorities differ by only a few thousands from the estimate of Leake, who supposes the city, including the port towns, to have contained about 192,000 inhabitants. Of these, all who corresponded to our laboring classes were slaves; a large proportion of the remainder were *meteci*, or residents of foreign birth; while the actual Athenian citizens, freemen in the enjoyment of all the civic rights, formed the smallest class of all. This statement uses the word citizen in a narrow sense, applying only to those within the walls; but the political privileges of an Athenian citizen were extended to all free-born and properly qualified citizens of Attica. They were generally divided into *eupatridæ*, or patricians, *geomoræ*, or landholders, and *demiurgi*, or tradespeople. (See ATTICA.)—The government of Athens in the time of its prosperity was in the hands of three bodies: the nine archons, elected annually; the *boule*, or council of state (of 400 members under Solon's constitution, 500 under Clisthenes, and after the year 806 B. C. increased to 600 members); and the assembly of the people (*ecclesia*). Among the archons were divided special departments of the executive power. (See ARCHON.) The

boule debated important measures previous to bringing them before the assembly of the people, received reports, decided to what courts certain appeals should be made, &c. Its members held office for one year, and it held daily meetings. The *ecclesiæ* were of three kinds: assemblies of the people held on fixed days, at intervals of about a month; those called on extraordinary occasions by committees (as we should call them) of the boule; and those which in important cases included not only the citizens of the city but of all Attica. These assemblies had the ultimate power of decision in all cases without appeal, made war and concluded peace, passed laws and made alliances, and confirmed or censured the acts of officials. Their meetings, usually held in the Agora, on the Pnyx, or in the theatre of Dionysus, were conducted with many ceremonies. The chief court of the Athenians was that of the Areopagus, the origin of which is lost in prehistoric legends. Men who had held the rank of archon composed it. Its jurisdiction extended over all cases of treason and special cases of murder, serious assault, and arson. (See AREOPAGUS.) Next stood the court of the *ephoræ*, who numbered 50, chosen from the citizens, who tried ordinary cases of murder and assault. There were several other courts of less importance. There were few taxes in ancient Athens. The state derived a great part of its income from the rent of its lands to private citizens. The taxes, including harbor dues, market taxes, taxes paid by foreign residents, the tax set upon public prostitutes (after the time of Pericles), and a few others, were farmed out. Upon the actual citizens there fell almost no burden of taxation. The fines imposed by the courts were also a considerable source of income for the state, and of course the largest sums of all were those extorted from enemies and foreign allies of the city.—The ceremonies connected with religious worship at Athens were perhaps more magnificent than in any other city of the ancient world. The chief among the great solemnities were the Panathenæa, the Dionysiac festival, and the Eleusinian mysteries. (See BACCHANALIA, ELEUSIS, and PANATHENÆA.) The rites and temples were under the charge of priests, whose offices were generally hereditary. Immense sums were annually expended by the state in beautifying the temples, sacred enclosures, and monuments of the gods, and the days dedicated to them were celebrated with magnificent ceremonies.—The private life of the Athenians in the most ancient days of the city was simple; but with the administration of Pericles, or even before it, their customs became extravagant and sensual. The magnificent Athenian banquets of this and subsequent periods surpassed almost all others of the time. The guests reclined on couches about the tables, while dancers of both sexes, musicians, and the songs of hired slave girls accompanied the most extravagant feasts. These ended with sym-

posia, or drinking bouts, generally scenes of the wildest license. The education of the citizen before this period of luxury was as follows: After having his name inscribed by his father or other relative in the catalogue of his phratry (see *ΑΤΤΙΟΑ*) when he was but three or four years old, the young Athenian was brought up during the next few years in the part of the house devoted to the women (*gynæceum*). At seven his actual education was begun under a pedagogue or tutor, under whose guidance he visited the schools and places of public athletic exercises, pursuing courses of rhetoric, mathematics, music, philosophy, and also of manly arts—riding, spear-throwing, wrestling, &c. Women and girls were scarcely allowed

by decorum any social intercourse, nor were any facilities furnished them for education. This accounts for the fact that the most intelligent and brilliant women of Athens were found among the *hetaræ*, a term which is wrongly translated by our word prostitutes; for these women, though actually hired mistresses, were generally an orderly, highly educated class, and only obeyed customs which were sanctioned by the age. An Athenian could marry at or after the age of 14. Heiresses were compelled by law to marry their next of kin, outside the natural limits of course, that the property might not pass to another gens. Divorce was obtained by the simple consent of both parties; adultery was severely punished.

General View of Modern Athens. (From a recent Photograph.)

The Athenian private houses were generally small frame buildings, with tiled roofs: the streets between them were narrow and crooked. Only as late as the time of Clisthenes were fine private houses constructed, and the custom once begun, it increased so fast that Demosthenes severely reprimanded certain citizens for building houses far surpassing the public edifices; no ruins remain to give us an idea of these. The dress of the Athenians was very simple. The older men wore white robes or *himatia*, the younger the saffron-colored *chlamys* or tunic. The women wore the *chiton*, a long woollen robe; over it a cloak or wrapping, the *diploidon*; and outside this again a simple shoulder cloak or cape, the *hemidiploidon*. This dress

varied little in times of festival.—In the present political division of the kingdom of Greece, Athens is the capital of the nomarchy of Attica and Bœotia, as well as of the entire kingdom. Its population in 1871, after a slow increase for several years, was 48,107. It is the residence of the king and court, and the seat of several important institutions of learning, art, and public charity. Among these are the university, employing more than 50 professors and instructors, and having a free library of more than 90,000 volumes; an observatory and botanical garden; two gymnasia on the German system; a military school, schools for the special education of priests and teachers, a polytechnic school, a seminary for girls, &c.

An "American female school" founded by Rev. J. H. Hill, is also maintained in the city; it was for a long time under the direct patronage of the government. The grammar and primary schools are excellent, and instruction is generally sought and widely diffused. Among the institutions of art is an association for the promotion of the study of the fine arts, and there are several museums in which the scattered relics of the old splendor of the city have been brought together and carefully arranged. Under the head of public charities fall an asylum for the blind and a hospital, both of considerable size. Among the public buildings are the palace, a fine building of three stories, near Mount Lycabettus, the chamber of deputies, the barracks, mint, theatre, and extensive structures intended for the assemblies of the national academy, and for the museum and polytechnic school. There are also about 100 churches, some of them admirable specimens of architecture. The largest is that of St. Nicodemus, built during the middle ages, in the Byzantine style. Like most of the others, it is not of great size, and depends for its effect on the beauty of its construction. The general appearance of the modern city is not especially attractive on near approach, though the magnificent height of the Acropolis, crowned with the ruins we have noticed above, and the pleasant situation of the town itself, give it a picturesque aspect when one views it from some distant point. Parts of the city have the dirt and squalor peculiar to nearly all towns of southeastern Europe; but its condition has been gradually improved since it became the royal residence, and now there are several broad streets and squares, well kept and clean. The hotels, shops, cafés, &c., are among the indications of the improvement of the city, and the local trade is active, though there is comparatively little commerce with foreign ports.—See Forchhammer's *Topographie von Athen* (in the *Kieler philologische Studien* for 1841, Kiel), and his essay in defence of his views in the *Zeitschrift für Alterthumswissenschaft* (1848, Nos. 69, 70); Leake's "Researches in Greece" (London, 1814), and especially his "Topography of Athens" (1821); also his work "On some Disputed Questions of Ancient Geography" (1857); Wordsworth's "Athens and Attica" (London, 1836); Stuart and Revett's "Antiquities of Athens" (London, 1825-7); Mure's "Journal of a Tour in Greece" (Edinburgh, 1842); Kruse's *Hellas* (Leipsic, 1826); K. O. Müller's *Attika* (in Ersch and Gruber's *Encyklopädie*, English translation by Lockhart, London, 1842); Prokesch's *Denkwürdigkeiten* (Stuttgart, 1836); the article "Athenæ" in Smith's "Dictionary of Greek and Roman Geography" (London, 1854); Boeckh's "Public Economy of the Athenians" (translated by Lewis, London, 1842); Wessenberg's "Life in Athens in the Time of Pericles" (London, no date); Prof. Felton's "Greece, Ancient and Modern"

(Boston, 1867); Tuckerman's "Greeks of Today" (New York, 1878).

ATHENS, a S. E. county of Ohio, on the Ohio river; area, 430 sq. m.; pop. in 1870, 23,769. It has railroad communication with Marietta, Columbus, and Cincinnati. The surface is well wooded and extremely fertile, and abounds in iron ore and coal; and large quantities of salt are manufactured throughout the county. The Hocking river intersects the county, and the Hocking canal extends from its centre to the Ohio canal. In 1870 the county produced 133,745 bushels of wheat, 96,012 of oats, 619,447 of Indian corn, 78,721 of potatoes, 23,239 tons of hay, 207,839 lbs. of tobacco, 513,864 of butter, and 201,593 of wool. There were 57,399 sheep and 15,097 hogs. Capital, Athens, on Hocking river and the Marietta and Cincinnati and Hocking Valley railroads, 70 m. S. E. of Columbus.

ATHENS, a city, capital of Clarke county, Ga., on the Oconee river, at the end of the Athens branch of the Georgia railroad; pop. in 1860, 3,848, of whom 1,893 were colored; in 1870, 4,251, of whom 1,967 were colored. It is the centre of a large cotton-growing region, and has several cotton factories. The university of Georgia, a state institution founded in 1801, is situated here. In 1868 it had 5 instructors, 76 students, 256 alumni, and a library of 7,500 volumes. The law department had 4 professors and 14 students. The city has three weekly newspapers, besides two periodicals.

ATHERTON, Charles G., an American senator, born at Amherst, N. H., July 4, 1804, died Nov. 15, 1853. He was elected a member of congress in 1837, and on Dec. 11, 1838, introduced under a suspension of the rules a series of resolutions, declaring that "congress has no jurisdiction over the institution of slavery in the several states of the confederacy," and that "every petition, memorial, resolution, proposition, or paper, touching or relating in any way or to any extent whatever to slavery, or to the abolition thereof, shall, on the presentation thereof, without any further action thereon, be laid on the table without being debated, printed, or referred." These resolutions were passed, under the previous question, by a vote of 126 to 78, and formed the basis of the 21st rule of the next congress, by which all such petitions, upon presentation, were considered as objected to, and the question of their reception laid on the table. Mr. Atherton continued in the house of representatives till 1843, when he was elected to the senate, where he remained till 1849. He was again elected in 1852.

ATHIAS, Joseph, a learned Jewish printer in Amsterdam, died about 1700. He is principally noted for having published two editions of the Old Testament in Hebrew in 1661 and 1667, on which, on account of their correctness, most of the modern editions are founded. They are remarkable for being the first in which the verses were marked with Arabic

figures. In acknowledgment of his merits the states general conferred upon Athias a chain of gold and a medal.

ATHLONE, a market town and parliamentary borough of Ireland, on both sides of the river Shannon, near its entrance into Lough Rea, partly in Westmeath and partly in Roscommon, 68 m. W. of Dublin; pop. in 1871, 6,617. The opposite shores of the river are here united by a handsome bridge, and a canal has been formed to avoid the rapids at this point, thus making navigation practicable for 70 miles higher up the stream. The castle on the right bank of the river, with its outworks, covers 15 acres. It is connected by railway with Dublin and Galway, and an active trade is carried on by steamers with Limerick and Shannon harbor, and with Dublin by the Grand and Royal canals. After the battle of the Boyne William III. besieged Athlone unsuccessfully, but it was taken by Gen. Ginkell, June 30, 1691.

ATHOL, *Athole*, or *Atholl*, a district in the northern part of Perthshire, Scotland, embracing about 450 sq. m. It is picturesque and mountainous, some of the summits attaining an elevation of more than 3,000 feet. It contains several lakes and beautiful valleys, among which is the pass of Killiecrankie, where Graham of Claverhouse gained a victory and met his death in 1689. Agriculture is carried on in the valleys, while on the hills sheep and cattle are pastured.

ATHOS (mod. Gr. *Hagion Oros*, holy mountain; Turk. *Aineros*), the easternmost of the three peninsulas projecting from ancient Chalcidica, in the N. W. part of the *Ægean* sea, now included in the Turkish eyalet of Salonica, about 80 m. long and from 4 to 7 broad. It is mountainous, and cut by numerous ravines. At its extremity stands the mountain from which it takes its name. Mt. Athos is about 6,850 ft. high, with a peak of white limestone, while its lower rocks are of gneiss and argillaceous slate. The sides of the mountain are flanked with vast forests of pines, oaks, and chestnuts, the pines growing to an immense size. Various kinds of aromatic herbs grow here in abundance, out of which the monks extract the oils and essence and use them for medicinal purposes, perfumery, and ingredients in incense. It was across the isthmus which connects the peninsula of Athos with the mainland that Xerxes cut a canal for his ships, in his invasion of Greece. The remains of this canal, according to the best authorities, are still distinctly visible through most of its extent. Near the middle of its course it is not discernible, having been filled up. Athos was so called from the giant of that name who in the Grecian mythology hurled the mountain at the gods. The peninsula in ancient times contained several flourishing cities and a temple of Jupiter; and in the middle ages it was dotted over with hermitages and monasteries, 20 of which still remain. Most of these mon-

asteries were founded by Byzantine princes. It was here that ambitious malcontents of the court of Constantinople, favorites in disgrace, and even private individuals, retired to await

Athos.

a change of affairs or return to favor. The monks at present number about 6,000, from Greece, Bulgaria, Roumania, and Russia, in all of which countries the convents of Athos possess estates. No female is permitted to enter the peninsula. The monks are ruled by an administrative assembly (*protaton*), composed of delegates from the various convents chosen for a term of four years. The administration of justice and the management of the revenue are also vested in this body. The assembly has its seat at Karias, the capital of the peninsula. A Turkish aga resides in Athos and collects an annual tribute from the convents. In the middle ages these convents were the seat of Greek science and the centre of Byzantine Christian knowledge, and possessed many large libraries. There are still to be found there old and beautiful manuscripts, several of which have been photographed and deposited in the museum of Moscow.

ATTILAN, or *Atitlan*, a lake of Central America, about 20 m. in length and 8 to 10 m. in breadth, situated in the department of Solola, Guatemala. It appears, from the geological formations about it, to lie in the crater of an ancient volcano, and it is of extraordinary depth, no soundings, it is said, being obtainable with a line of 1,800 ft. Although several small streams flow into it, no outlet has been discovered. The scenery in its neighborhood is remarkably picturesque; high cliffs surround it, with but little vegetation. On the southern bank of the lake is a small Indian town of the same name, having barely 2,000 inhabitants.

ATKINSON, *Thomas William*, an English artist and traveller, born in Yorkshire, March 6,

1799, died at Lower Walmer, Kent, Aug. 18, 1861. He excelled by his architectural designs and in landscape gardening, and wrote "Gothic Ornaments of English Cathedrals." He travelled extensively, and published "Oriental and Western Siberia, a Narrative of seven years' Explorations and Adventures in Siberia, Mongolia, the Kirghis Steppes, Chinese Tartary, and part of Central Asia" (London, 1857), and "Travels in the Regions of the Upper and Lower Amoor" (1860), both works illustrated from his own designs.

ATLANTA, a city, capital of Georgia, and also of Fulton county, and next to Savannah the largest and most important city in the state, 101 m. N. W. of Macon and 171 m. W. of Augusta; pop. in 1860, 9,554; in 1870, 21,789, of which 9,929 were colored. It is an important railway centre, the Atlanta and West Point, Atlanta and Richmond, Western and Atlantic, Georgia, and Macon and Western railroads connecting here. There is also a street railroad company. Atlanta lies nearly 1,100 ft. above the sea, and is built upon hilly ground. It is laid out in the form of a circle, about 8 m. in diameter, the union passenger depot occupying the centre. Oglethorpe park, at the terminus of Marietta street, about 2 m. from the depot, contains fine drives, lakes, &c. The chief public buildings are the state capitol, the city hall, the first Methodist church (South), the opera house, and the Kimball house, one of the largest hotels in the South. The principal manufactures are a rolling mill, three foundries, three planing mills, several flour mills, two railway shops, a brewery, and several tobacco factories. The business of the city amounts to about \$35,000,000 annually. The valuation of property in 1872 was \$13,545,585. There are two national banks, with a capital of \$400,000, a loan and trust company, and two savings banks. The city is governed by a mayor and a board of 14 councilmen (two from each ward). The police force consists of 55 officers and privates. There are three steam fire engines, two hand engines, and a hook and ladder company. Atlanta contains a branch of the Baptist orphans' home and a ladies' relief society. Steps were taken in the autumn of 1869 to establish a public school system, and in 1872 three school houses had been erected, and 29 teachers were employed. Other institutions of learning are the North Georgia female college, Atlanta medical college, Oglethorpe college, Atlanta university (colored), two business colleges, an English and German select school, an orphans' free school, and a colored school. Oglethorpe college has a library of 5,000 volumes; the young men's library association possesses about 8,000 volumes; and the state library contains 16,000 volumes. Three daily and two weekly newspapers and three monthly periodicals are published. There are 28 churches, viz.: 6 Baptist (1 colored), 1 Roman Catholic, 1 Christian, 1 Congregational, 2 Episcopal, 1 Jewish, 1 Lutheran, 13 Methodist (9 Southern and 3 colored),

and 2 Presbyterian.—Atlanta was incorporated as a city in 1847. During the civil war it acquired great importance as the chief entrepôt of trade between the western and Atlantic and gulf states, the principal manufacturing town in the south, and the seat of various government works of the confederacy. It was then strongly fortified. Gen. Sherman began an advance upon it from Chattanooga at the beginning of May, 1864, with 98,000 men and 254 guns. The defence was intrusted to Gen. Joseph E. Johnston, with about 50,000 men, occupying a position at Dalton. By a series of flank movements, and some severe fighting, particularly at Resaca, New Hope church, and Kenesaw and Lost mountains, Johnston, though skilfully manœuvring, was forced to retire from position to position, to the very defences of Atlanta, which he reached before the middle of July. On the 17th he was superseded by Gen. Hood, who assumed the offensive, making three heavy attacks on the federal forces (July 20, 22, and 28). These were repulsed with great loss, and Atlanta was besieged till Sept. 1, when Hood was compelled to evacuate it by a flank movement of Sherman's army which covered the lines of railroad in the rear of the confederates. Before abandoning the city, to fall back on Macon, Gen. Hood set fire to all the machinery, supplies, and munitions of war which he could not remove. The federal losses from Chattanooga to the occupation of Atlanta were 30,400 men and 15 cannon. The confederate losses amounted to about 42,000 men, 40 or 50 guns, and 25,000 stand of small arms. Both armies had been reinforced during the four months' contest. When Sherman moved his base of supplies to Chattanooga in November, the machine shops, depots, government buildings, &c., were set on fire. After the reconstruction of the state and the adoption of the constitution of 1868, Atlanta became the capital, since which time it has increased in population with remarkable rapidity.

ATLANTIC, a S. S. E. county of New Jersey; area, 620 sq. m.; pop. in 1870, 14,093. The Atlantic ocean borders it on the S. E., where it is indented by Great Egg harbor, Absecon and several other bays, studded with islands and planted with oysters. It is intersected by Great Egg Harbor river. The surface is low and flat; it is marshy near the coast, and the soil further inland is light and sandy. In 1870 the county produced 7,198 bushels of wheat, 47,488 of Indian corn, 31,702 of Irish and 18,514 of sweet potatoes, 4,675 tons of hay, and 5,020 gallons of wine. Capital, May's Landing.

ATLANTIC OCEAN, that branch of the general ocean which separates the continents of Europe and Africa from America. Its oldest name among the ancients was simply the Ocean (ὁ Ὠκεανός); it was afterward named the Atlantic ocean from Mount Atlas, which rises near its shores. It was known and navigated by the Phœnicians long before the be-

ginning of Greek historical records. Some of their colonies on its coasts are said to have been founded as early as 1100 B. C., and their commerce extended to the British islands and the Baltic. To the south they went equally far, and are believed to have even circumnavigated Africa six centuries before Christ, about the same time that the more timid Greeks recorded the passage of the first navigator of their nation through the strait of Gibraltar. But the real importance of this ocean as the great highway of modern civilization dates from the 14th and 15th centuries, when the outlying groups of islands, the Canaries, Madeira, and the Azores, were first visited, and finally Columbus, cutting loose from coasting voyages, struck across its unknown waste to the discovery of a new world. I. GEOGRAPHICAL DESCRIPTION. The limits of the Atlantic ocean have been taken rather arbitrarily, generally between the Arctic circle and a line drawn from Cape Horn to the Cape of Good Hope. In physical geography it is a branch of the great southern ocean, forming a deep gulf of which the Arctic ocean is the blind end. Taken as a whole, the Atlantic has the shape of an irregular broad canal running north and south, with a deep bend to the west in the middle of its course. The projecting angles of the bordering continents are said by Humboldt to correspond to the reëntering ones on the opposite side. But in reality this correspondence is somewhat distorted, and thus narrows are formed by which the Atlantic is divided into three principal basins: the southern or Ethiopic, from the Antarctic ocean to the narrows between Cape San Roque and Senegambia; the middle or Atlantic proper, from the same narrows to the range of islands formed by the British and Faroe islands and Iceland; and the northern or Arctic. The Atlantic proper contrasts strongly with the Ethiopic by the great development of its shore line and the number of lateral arms or mediterranean seas in communication with it. Such are the Caribbean sea, the gulfs of Mexico and of St. Lawrence, Baffin and Hudson bays, the Baltic, the North sea or German ocean, the Irish sea, and the Mediterranean with its dependencies the Adriatic and the Black sea. In the Ethiopic ocean, on the contrary, the coasts are very uniform, with few indentations or bays, and no inland seas at all. The watershed of the continents bordering on the Atlantic basin is of remarkable extent, all the other oceans of the earth put together receiving but a fraction of the fresh-water drainage in comparison. Several rivers of Asia and one or two in northwestern America can alone bear a comparison with those of the Atlantic basin. The number of islands in the Atlantic ocean is small when compared with those of the Pacific. Leaving aside those islands which are merely detached parts of the continents, we can count scarcely more than a dozen groups. Like most of that class, they are principally of volcanic origin. Of coral islands, so numer-

ous in the Pacific, there are but two groups, the Bermudas and the Bahamas. II. DEPTH, AND FIGURE OF THE BOTTOM. The means employed for ascertaining the depth are generally modifications of the old-fashioned lead and line. In moderate depths this method suffices in its simplest form. In great depths, however, its indications are apt to be untrustworthy, because the shock of the lead on the bottom ceases to be felt, and the line continues to run by its own weight or is carried off by currents without sensibly slackening. Sounding with a small line or twine, to be abandoned together with the weight at each cast, was tried, but failed for want of means to determine when the bottom was reached. No sounding being now considered trustworthy unless a specimen of bottom is brought up as a proof that the lead has touched, it was found desirable to be relieved of the labor of hauling up the weight, and to bring up only the small apparatus and to collect the mud or sand. This was first accomplished by Lieut. Brooke's apparatus, a perforated cannon ball suspended in a sling which unhooks itself when the tension is relieved; an iron rod passing through the hole in the ball is provided with a contrivance to bring up a specimen, and is the only weight remaining on the line. Lieut. (now Admiral) Sands substituted two hemispheres for the solid shot, falling off on each side of the central rod, thus allowing a larger specimen cup to be employed. An original method proposed by Prof. Trowbridge consists in paying out the line (a small but strong twine) from a coil carried down with the weight, thus avoiding the friction of the line in passing through the water. The depth is registered by a screw similar to Massey's. Propositions for sounding without line have been numerous, the weight carrying down a float which is released on the bottom and returns to the surface; but none have been successful. In the United States coast survey deep-sea soundings are now usually made with a strong line and a heavy weight; detaching the latter is not considered of great importance, since the hauling up is done by steam. The depth is registered by Massey's indicator, based on the principle of a propeller screw, free to revolve in passing downward, and communicating its motion to a set of wheels registering the number of revolutions. It is clamped loosely to a spindle so as to be free from the torsion of the line, and is carefully tested and its error determined in moderate depths. The Atlantic ocean in its northern basin is better known with regard to depth than any of the others; nevertheless, there is need of more soundings before we can form a true idea of the figure of its bottom. Most of our knowledge of it has been acquired during the last 80 years. Before that, a few soundings, now mostly considered untrustworthy, and some theoretical speculations, were the sum of our knowledge. Dr. Young deduced, chiefly from the theory of tides, a depth of about 15,000 ft.

for the Atlantic, which is probably not far from the truth. Laplace supposed the mean depth of the ocean to be of the same order as the mean elevation of the land. But his supposed mean height of the land, 3,000 ft. (Humboldt estimated it more correctly at 1,000), was much too small to represent the mean depth of the ocean. Among the first connected series of deep-sea soundings were those made by the United States coast survey in connection with the exploration of the Gulf stream, those of Capt. Lee and Capt. Berryman in the brig *Dolphin*, of Sir Leopold McClintock in the *Bulldog*, and others. When the projects for laying submarine telegraph cables across the ocean began to assume importance, a sudden impetus was given to deep-sea sounding; complete sections across the ocean were explored in different directions, and the whole subject appeared much less formidable than before. After such feats as finding and grappling successfully a broken cable in mid-ocean and in nearly two thousand fathoms, the mere fact of sounding to obtain the depth appeared very simple. In late years a new scientific interest has arisen in the study of the deep-sea bottom by means of the dredge, and puerous soundings have been taken in connection with it in Europe and America. In studying a chart of the ocean containing many soundings it will be observed that on leaving the shore, in the greater number of cases, the depth does not increase regularly or according to a uniform slope, but that the bottom forms as it were a terrace around the continents, sloping very gradually down to a certain depth, from which there is a much more rapid descent into deep water. This depth we may assume at about 100 fathoms, and that line is generally marked on the maps; but it is really somewhat less, probably in the neighborhood of 80 fathoms. We may, for instance, find that we must sail 100 m. from the shore to find 100 fathoms depth; but in 10 m. more the lead would sink to 1,000. Hence, should the level of the ocean sink 100 fathoms, a large addition of territory would be made to the continents; 100 fathoms more would increase this addition by a mere narrow strip, very steep toward the sea. This terrace probably marks the ancient margin of the continents, and has been gradually formed by the encroachment of the ocean on the land. Hence it is as a rule wider on coasts formed of materials easily disintegrated than on those formed of hard rocks. The terrace is narrow on the coast of Spain and Portugal, and widens largely from the bay of Biscay northward, extending from 50 to 100 m. outside of the British islands, which it embraces together with the whole North sea. It is narrow along the coast of Norway, but extends from Spitzbergen half way to Cape North. On the coast of North America it is very wide, though interrupted at several points, from Newfoundland to Cape Cod, embracing all the banks. South of Cape Cod it is from 60 to 100 m. broad,

narrowest at Cape Hatteras and tapering off toward Florida, but wide again on the W. side of this peninsula. The West Indies generally rise out of deep water. The terrace along the coast of South America varies generally from 60 to 100 m. in breadth, but becomes much wider S. of the Rio de la Plata, so as to include the Falklands. At the Cape of Good Hope it extends about 100 m. S. It has not yet been developed by observation along the W. coast of Africa. With regard to the depth of the trough of the South Atlantic ocean, we have little information. Some of the supposed deepest soundings on record, from 7,000 to 8,000 fathoms, were made off the coast of South America, but they are entirely discredited now. From a few trustworthy ones it is fair to suppose this basin to have what is probably the average depth of all oceans, viz., from 2,000 to 3,000 fathoms. (It may be stated in passing, that for the Pacific ocean the average depth between Japan and California, deduced from the velocity of earthquake waves, was found a little over 2,000 fathoms, between Chili and the Sandwich Islands 2,500, and between Chili and New Zealand only 1,500 fathoms.) Of the North Atlantic more is known than of any other ocean. The lines of soundings taken from England and France to Newfoundland, for the telegraph cables, show that no depth in that part exceeds 3,400 fathoms. From these and other soundings it appears that the bed of the North Atlantic consists of two valleys separated by a broad ridge running from the Azores to Iceland. The depth over the ridge is always less than 2,000 fathoms, generally about 1,500; it widens and shoals toward the north, forming there a wide plateau embracing both Iceland and the Faroe islands, with a depth of little more than 300 fathoms. The eastern valley varies between 2,000 and 2,500 fathoms, seems to extend to the equator, and shoals and tapers toward the north, turning at the same time toward the northeast, until it is reduced to the narrow channel between the Shetland and Faroe islands, with 600 fathoms. Beyond this point it cannot be followed for want of data. The western valley is not well known in its southern and middle part. It is probably very broad in the great bay formed between the West Indies, the United States, and Newfoundland, depths of over 3,000 fathoms being reported S. of the Bermudas. Very deep water, 4,580 fathoms, is said to have been found a short distance S. of the Grand Bank of Newfoundland, but this has not yet been corroborated by additional soundings. The valley then passes E. of the banks, gradually shoaling, and, after sending an offset into Davis strait, passes into the Arctic ocean through the narrow passage between Iceland and Greenland, having there a probable depth of a little more than 1,000 fathoms. Of the seas communicating with the Atlantic, the Mediterranean in its two basins reaches a depth of about 1,600

fathoms in the western and 2,200 in the eastern; and the Black sea a depth of 800 to 900 fathoms. The whole Mediterranean system is separated from the Atlantic by a barrier of 150 to 200 fathoms at the strait of Gibraltar. The Caribbean sea is deep, reaching to about 2,500 fathoms in some parts, and the passages between the Windward Islands are in some places more than 1,000 fathoms. The passage through the strait of Yucatan has about the same depth, and the gulf of Mexico may reach 2,000 fathoms in its central part. Its communications with the Atlantic through the strait of Florida and the Old Bahama channel do not exceed 400 or 500 fathoms.—From what we know at present of the Atlantic ocean bottom, it appears to be entirely destitute of any submarine chains of mountains analogous to those we have on land; there are no steep valleys, no bare rocks, in fact none of that variety of surface which on dry land contributes so much to the beauty of the scenery. For incalculable ages a slow but permanent shower of organic débris has been descending from the surface, which, mingling at the bottom with the skeletons of its inhabitants, has formed a uniform layer of a soft calcareous ooze of unknown thickness, covering the accidents of the bottom as a snowstorm levels the hillocks and ditches of our fields. Being entirely unaffected by changes of temperature and of moisture, the ocean bottom cannot show the effects of weather or of erosion, the magnitude of which on the terrestrial relief is as yet greatly underrated even by many geologists. It is only in the northern parts of the ocean (and probably in the southern also) that in a certain sense the traces of atmospheric action on the surface of the bottom can be found, but only mediately. The banks of Newfoundland are, if not formed, at least increased by the sand and pebbles annually brought down, though in small quantities, from the arctic regions by the icebergs, of which this is the great melting ground. The rounded pebbles of basalt found by Wallich between the Faroe islands and Iceland, and the gravel and pebbles observed by Carpenter in the deep-sea dredgings off the Faroes, have probably also an arctic origin, drift ice having been seen, though rarely, very nearly in the same localities. The foregoing remarks apply of course only to the deep-sea basin. On the terrace fringing the continents the force of tidal and other currents has had more effect in shaping the bottom; rocks and coral reefs lift their heads to or above the surface; in a word, there is more superficial variety, but even here it is seldom comparable to many of the subaërial reliefs.

III. CONSTRUCTION OF THE OCEAN BED. It has always been the practice in navigation to arm the sounding lead, *i. e.*, to fill a cavity at its base with tallow (the arming). Particles of sand, stones, shells, &c., remain attached to it after a cast, and give, by their proportions, color, or size, indications of the position of a ship, frequently of great value. Hydrographers

have devised more convenient means of bringing up specimens of the bottom. In France the sounding lance is mostly used, a pointed bar of iron projecting under the lead, and provided with notches or barbs in which the sand or mud remains. In the United States coast survey the characteristic specimens of bottom are preserved with care, in the first place as vouchers of the correctness of the data given on the charts, and secondly for purposes of scientific investigation. Lieut. Stellwagen, U. S. N., while on coast survey duty, proposed a simple instrument for bringing up specimens, which, under the name of the Stellwagen cup, has been extensively and satisfactorily used. It consists in a conical iron cup, screwed into a rod projecting from the base of the lead, and having its opening covered by a loose leather valve. When the lead strikes, the cup is driven into the bottom and fills, and the pressure of the water afterward keeps the cover down while hauling up. A slightly different sounding cup was invented by Admiral Sands, in which the opening into the cup is at the side and kept closed by a spring, which opens only when the cup is penetrating into the soil. In Brooke's sounding apparatus, before mentioned, the cavity at the end of the rod was at first filled with quills in which the mud lodged; later a valve was provided which was pressed over the opening by the sliding off of the cannon ball. The quantity brought up in that way was, however, always very small. The greater part of the extensive collection of specimens of soundings in the coast survey office in Washington have been procured with the Stellwagen and the Sands cups. In England the Bulldog machine, so called, has been successfully used for some years. It is a modification of Capt. Ross's clams, and consists of a pair of scoops closing against each other and thus bringing up a considerable quantity of material. The results obtained by these different methods have been laid down in maps, in France by M. Delesse and in America by Mr. Pourtalés, and thus a general idea of the geology of the bottom of the ocean has been obtained, or rather of its lithology, as M. Delesse has called it; for under water it is only the superficial layer which is brought to our knowledge; of its thickness, superposition, &c., the sounding lead can give us no idea. From these researches it appears that on the coast terrace there is, as might be expected, a great variety in the constitution of the bottom. It reflects as it were the geological formations of the adjacent shore, but with this difference, that the movement of the water produces a sifting action when agitated by the tides, winds, or currents, the heavier and harder particles remaining alone in some localities, while the lighter and finer materials are transported and deposited in others. This accounts in part for the immense preponderance of silicious sand in the deposits of the terrace, since it is the result of the decomposition of most of the primitive

rocks and of the sifting out of many of the secondary and tertiary formations. Limestones, being generally soft, are reduced to impalpable powder and form deposits of calcareous mud; while argillaceous mud results from the decomposition of clay slates, marl, and true clay beds. Large pebbles or shingle are rare at a distance from the shore, though common enough on the beaches. They seem to be covered by finer materials, except where swept by currents, as for instance in the British channel, where several banks of flints from the decomposed chalk beds are known to exist. But besides the deposits of which we have spoken, resulting from decomposition or remodelling of preëxisting ones, there are real formations on a very large scale now going on. The lime dissolved in the sea water is assimilated by organized beings, animals or plants, secreted in solid form, principally as a carbonate, and, after having performed a short duty in the organic world, contributes in the form of a new inorganic body to the increase of the earth crust. Thus we see in the vicinity of coral reefs the bottom composed of calcareous mud or sand formed by the dispersion of corals, shells, and echinoderms, and in shoaler parts largely by the decomposition of lime-secreting seaweeds. This mud or sand often consolidates into hard limestone rock, but more frequently when exposed to the atmosphere than when it remains under water. But it is chiefly in the deep-sea bed that lime deposits produced by organized beings assume gigantic proportions, at least in horizontal extent. The entire bed of the ocean as far as explored, outside of the coast terrace, is covered by a uniform layer of soft calcareous mud, called ooze by sailors, and composed chiefly of *foraminifera*, low organisms forming minute chambered shells, and living partly on the bottom and partly near the surface, whence they sink after death. With them are mixed the shells of floating mollusks, such as pteropoda, of other mollusks inhabiting the bottom itself, the tubes of worms, the remains of *bryozoa*, echinoderms, corals, &c. Some silica is contributed, but in smaller proportions, by analogous process performed by sponges, *polycystina*, and *diatomacea*. It is, in a word, chalk in process of formation, and has been found throughout the tropical and temperate regions; in the arctic seas observations are still wanting. Along the coast of the United States the terrace is principally sand. Mud is found in the deep gulf between Cape Cod and Cape Sable, S. of Nantucket, Martha's Vineyard, and Block island, for a distance of nearly 80 m. (Block island soundings), in the so-called mudholes off the entrance to New York harbor, and in a few other localities. A few rocky patches of small extent are found off the New England coast, near New York, and along the coast of the Carolinas. At Cape Florida the sand is replaced by the coral formation which envelops the southern extremity of the peninsula, and which may be divided into two, the reef for-

mation and the deep-sea coral formation; the former extends from the shores to a depth of about 90 fathoms, but receives its supplies almost solely from a region between the surface and 10 or 15 fathoms, where the reef-building corals live. The second or deep-sea coral formation extends from 90 fathoms to about 300. Beyond this depth, and sometimes even from 100 fathoms downward, the deep-sea ooze or foraminifera mud is found everywhere. IV. CURRENTS. Columbus, according to Dr. Kohl's "History of the Gulf Stream," was the first navigator who observed ocean currents, having noticed that in sounding in the Sargasso sea the lead appeared to be carried away from the ship, a fact which he rightly interpreted by the ship being drifted away from the lead by a surface current. In some of his later voyages he also observed the rapid flow of water through the passages among the Antilles, and the strong currents in the Caribbean sea and on the coast of Honduras. Sebastian Cabot noticed the Labrador current about the same time. The first notice of the Gulf stream, the most important of the currents of the Atlantic, is found in the journal of Alaminos, the pilot of Ponce de Leon in the expedition which led to the discovery of Florida in 1513. Alaminos, making use of his discovery, led the way in sailing down stream through the strait of Florida when carrying Cortes's despatches from Vera Cruz to Spain. In the narratives of the navigators of the 16th and 17th centuries frequent mention is made of the ocean currents, and in particular of the Gulf stream; it is therefore not a little singular that their details were so imperfectly known as late as the second half of the 18th century that they were rather an impediment than a help to navigation, at least for the intercourse between Europe and the northern parts of America. The New England whalers at that time were the best acquainted with the limits of the Gulf stream, and from one of them Benjamin Franklin obtained the information which he published in his chart of that current, intended to point out the most favorable routes between the North American colonies and the mother country. Franklin and Blagden also pointed out the difference between the temperature of the water in the Gulf stream and outside of it. Pownall and Jonathan Williams extended our knowledge of this current; Capt. Strickland remarked its extension further N. and E. than was before suspected, and first argued the existence of the N. E. branch of the Gulf stream, about which there has been so much controversy of late. Humboldt and Scoresby also paid much attention to ocean currents, and particularly to the Gulf stream. Finally, Major Rennel undertook the discussion of all the observations of currents, and published the results of his generalizations under the title of "Investigations of the Currents of the Atlantic Ocean," a work which remains to this day the principal source of information on the subject.

The circulation of the water in the Atlantic ocean can be stated in very general terms to consist of two gigantic eddies or revolving streams, the one in the northern Atlantic, the other in the southern or Ethiopic basin; the former revolving from left to right, the other from right to left; both giving out offshoots of greater or less importance on their outer circumference. Both originate in the equatorial current, which consists of two parallel parts, the northern and southern, separated by a narrower return current, called the Guinea current. The southern equatorial current, starting from the coast of Africa and striking the coast of South America at Cape San Roque, divides itself into two branches. The southern one follows the coast of Brazil under the name of the Brazilian current, dividing about the latitude of the tropic of Capricorn into two branches, the smaller one following the coast, but gradually growing narrower and weaker, nearly as far as the extremity of South America. The larger and wider portion strikes toward the southeast in the direction of the Cape of Good Hope, under the name of the southern connecting current; a short distance west of this cape the current turns north and follows the coast of Africa, under the name of the South Atlantic current, toward the equator, where the circuit is completed. This current is accompanied in its northern course, and between it and the coast, by a branch of the cold Antarctic current, the waters of which can be traced for a long distance by their temperature. The northern branch of the south equatorial current follows the coast of South America from Cape San Roque to the Antilles, where it penetrates into the Caribbean sea, jointly with the larger north equatorial current. Thus a portion of the waters of the South Atlantic is carried into the North Atlantic, for which apparently no return is made as far as surface currents are concerned. After entering the Caribbean sea, the current is driven through the straits of Yucatan into the gulf of Mexico. The principal mass of the water then turns to the eastward along the northern coast of Cuba, while a smaller and less known branch is said to follow the western and northern coasts of the gulf, ultimately falling in again with the former. After passing the southern extremity of Florida the current receives the name of the Gulf stream, and passes north through the narrows of Bemini between Florida and the Bahama banks into the Atlantic ocean. It now follows the coast of the United States at a somewhat variable distance to about the latitude of Chesapeake bay, when it turns east. On the S. side of the banks of Newfoundland it is pressed in by the polar current, and according to some authors ceases to exist as a special current. It is most probable that a portion of its waters continues its course eastward across the ocean, bending south between the Azores and the coast of Portugal, and finally returning along the coast of Africa to the equa-

torial current, and thus completing the circuit. A small offset enters the Mediterranean through the strait of Gibraltar. Another small branch separates at Cape Finisterre, sweeps around the bay of Biscay in a northerly direction, and dies out finally on the coast of Ireland. This is Rennel's current, named so after its discoverer. From the region east of the banks of Newfoundland, the waters of the Gulf stream or of the general ocean drift (the question being disputed) move northward toward the coasts of northern Europe, to which they carry their heat, passing the North Cape, and reaching nearly to Nova Zembla. Interweaving with the polar current, a branch passes up the N. coast of Spitzbergen, another around the west to the N. coast of Iceland, another along the W. coast of Greenland into Davis strait. A polar current, carrying large quantities of ice at certain seasons, descends along the W. shore of Davis strait and the coasts of Labrador and Newfoundland, and passes, part of it under the Gulf stream, and part between that stream and the coast of the United States.—*Causes of currents.* The various theories propounded to explain the circulation of the water in the ocean have been based—1, on the effect of permanent winds; 2, on differences of density due to evaporation; 3, on differences of density due to temperature; 4, on the rotation of the earth; 5, on difference of barometric pressure; and finally, on combinations of these causes. The first author to leave a theory of currents was Kepler, who attributed them to the rotation of the earth, remarking that as the water is only in loose contact with the earth, it cannot follow the rotation eastward as fast, and remains behind. He was followed and sustained by Varenus in 1650. Vossius and Fournier a little later adopted the heat and evaporation theories, but in a rather extravagant form, the former supposing the heat of the sun to expand and attract the water of the ocean into a kind of long mountain ridge, which, following the sun, broke on the coast of America, producing the currents running along the shore; a curious glimpse of the usual tidal theory. Fournier supposed, on the contrary, a hollow or valley formed by evaporation in the ocean in the tropics, causing a constant rush of the polar waters to fill it up. Coming down to Franklin, we find him an advocate of the trade-wind theory for the Gulf stream, while, later, Humboldt explained the phenomenon by the rotation of the earth. Major Rennel, in his work on ocean currents, divides the currents into two classes. Drift currents, according to him, are the effect of the permanent winds on the surface of the water, by which the superficial layers are set in motion; when a drift current meets with an obstacle, the general surface is raised by accumulation, and the water in trying to return to its level produces a deeper and generally more rapid flow called a stream current. The equatorial current is an example of the former, the

Gulf stream of the latter. It would take too much space to detail all the theories of modern authors, but a few must still be mentioned. Capt. M. F. Maury gave an exaggerated weight to differences of density of sea water in northern and southern parts of the ocean. Sir John Herschel, in his article on physical geography in the "Encyclopædia Britannica," attributed the currents to the effect of the trade winds. Before his death he seems to have fallen in with the views of Prof. Carpenter mentioned under the head of Gulf stream. Dr. Mühri of Göttingen, in his work on ocean currents, gives the following conclusions: 1. There are in ocean circulation two great movements perpendicular to each other, the one following the equator, the other the direction of the meridians. 2. The equatorial circulation results from the inertia of water with regard to the rotation of the earth; the meridional or thermometric circulation is caused by the difference of temperature between the polar and equatorial regions. 3. The meridional as well as the equatorial circulations exhibit two motions in contrary directions, which compensate each other and are superposed to each other in part in the thermometric circulation, on account of their unequal density. 4. The unequal distribution of the continents impedes the regularity of the great movements of circulation, and, in conjunction with the unequal relief of the bottom and the action of the winds, induces secondary currents disturbing the general motion. — *Gulf stream.* The importance of this great current to the commerce and navigation of North America, to which reference has been made before, the great scientific interest it presents by its size, temperature, and influence on climate, have made it, in the words of Prof. Bache, "the great hydrographic feature of the United States coast." Under the superintendence of the late Prof. Bache, the United States coast survey has accumulated a large number of observations of that part of the stream comprised between its entrance into the straits of Florida and the region where it leaves the coast after having changed its course to the east. The observations were directed chiefly toward the determination of the depth, the figure and constitution of the bottom, and the temperature from the surface down through the whole depth. The instruments used for temperature have been of various construction. Metallic thermometers in the watch form were used, enclosed in strong brass vessels; they answered well enough, and were employed to a considerable extent in the earlier researches; but in several instances the brass box was crushed by the pressure. Self-registering thermometers in glass globes were used also, but they had the inconvenience of experiencing the changes of temperature too slowly. Six's self-registering thermometers were used extensively, up to about 100 fathoms, beyond which they are liable to be crushed; and in all cases their indications are rendered very erroneous by the

pressure. For great depths Saxton's metallic thermometer has been of great service. This instrument consists in a ribbon of two metals of different expansion, soldered together and rolled in a cylindrical spiral around a spindle, to which the movement of expansion or contraction is communicated, and by it transferred to a hand or needle moving an index over a graduated dial. The whole is enclosed in a suitable case perforated for the passage of the water. It works well, but is affected by pressure in a manner not easily explained. At present the Miller-Casella protected thermometer is used, and proves an excellent and trustworthy instrument. It is in the main a Six's self-registering maximum and minimum thermometer, the bulb of which is protected from pressure by an outer bulb blown over it and sealed round the neck, a space being left between the two bulbs, partially filled with alcohol, in order to communicate the temperature more rapidly to the inner bulb. The observations were made at a number of stations in lines or sections at right angles to the stream. The thermometer was observed at the surface and at different depths, generally at every ten fathoms as far as 50, and at every hundred fathoms in greater depths. When the change of temperature was very rapid, the number of sections, stations, and observations was multiplied to keep pace with it. The results were arranged afterward in diagrams, where the changes of temperature were represented by curves, thus giving at a glance the distribution of heat throughout the stream. From these observations the following general deductions were made: In the sections between Florida and Cuba the highest temperatures were found near the Cuban coast, where also the greatest depth was recorded. It was observed by Mr. Mitchell that very near the coast of that island the stream had a uniform velocity and constant course for a depth of 600 fathoms, although in this depth the temperature varied 40°. The stratum of warm water was found to be of much greater thickness or depth toward the middle of the straits than nearer shore; thus at a distance of 6 or 7 m. from Havana the layer of water above the temperature of 70° extended only to a depth of about 70 fathoms, while some 80 m. off the coast its thickness was about 180 fathoms. The slope of the bottom is very abrupt on the Cuban coast, but much more gradual on the Florida side, where the current is also more irregular, taking sometimes even the shape of a counter current running west. It is also here affected by the winds and tides. The same character as in this section is maintained throughout the straits of Florida to the narrows of Bemini. No permanent current was found in the St. Nicholas and Santarost channels, sometimes regarded as partial feeders of the Gulf stream. Toward the narrows of Bemini the breadth and depth of the straits diminish and reach their minimum, the breadth being only 44 m. and the greatest depth 370 fathoms.

The bottom presents here some inequalities in the shape of longitudinal ridges, the effect of which is to press the cold water of the bottom toward the surface, by which the first indication is produced of those alternate bands of warmer and colder water noticed further north. The warmest water is still found nearer the eastern or right bank of the stream; but after leaving the straits, and when the stream has gradually widened, the warmest water is on the left or western edge. The stream now runs parallel to the coast, distant from it about 70 or 80 m., turning gradually to the N. E. from the due N. course it had on leaving the narrows. It approaches nearest to the land at Cape Hatteras, takes there a slightly more northern direction, and shortly after turns sharply to the east, its rather variable western edge being then about lat. 38°. The space between the shore and the stream is occupied by the cold water of the polar current, and the contrast between it and the warm water becomes more and more abrupt, particularly at some depth, so that the plane of separation received from Lieut. Bache, who first noticed it, the name of the cold wall. At the surface the warm water overflows the cold, forming a thinned-out superficial layer, the limits of which vary somewhat according to the seasons and prevailing winds, certainly much more than the main body of the stream. The bands of cold and warm water increase in number, from three warm ones when coming out of the

narrows to six or seven in the section off Sandy Hook; it must however be remarked that several of them are very vaguely defined and far from constant. In the same section the depth of the stream is still very considerable, its limits being nearly as well marked by the difference of temperature at 400 fathoms as it is nearer the surface. In the following tables the temperatures of the water at different depths are given in a form nearly as plain as in a diagram for two of the sections. The first is for the section between Cape Florida and the Bemini islands. The full line represents the surface; above it are given the distances from Cape Florida. The depths are given on the side, and are indicated across the table by dotted lines for every hundred fathoms. The figures of the first line give the temperature from the average of the observations taken at the surface and at 5, 10, 20, and 30 fathoms; of the second line the average at 50, 70, 100, and 150 fathoms; and in the third are combined the temperatures at 200 and 300 fathoms. The figures arranged vertically over each other represent observations taken at the same station. Table II. is a similar arrangement of the observations in the section off Sandy Hook (New York). The first line gives the temperatures at the same depths as the first line of Table I.; the second line gives the averages of the observations at 40, 60, 80, and 100 fathoms; the third of the same at 200 and 300 fathoms; and the fourth the observations at 400 fathoms:

400	37	40	38	39	40	40	43	52	55	57	57	55

Both tables show the difference of temperature between the Gulf stream and the inshore cold water or polar current to be distinctly traceable down to 400 fathoms at least; indeed, in both cases the actual difference is greater near the bottom than at the surface, being in the narrows of 10° at 250 fathoms against 7° at the surface, and off Sandy Hook of about 18° at

400 fathoms, while at the surface it is only 14° or 15°. The surface differences would of course vary with the seasons, but it is proper to call attention here to the fact that the stratum of water above 60° is still nearly 300 fathoms thick in this latitude. The theory frequently propounded that the polar current underlies the Gulf stream and penetrates through the

straits of Florida into the gulf of Mexico, is rendered very improbable by Mr. Mitchell's observations cited above, and by the volume of water necessarily passing through these straits to supply as large a cross section as we find off New York. It is much more probable that the cold water at the bottom of the gulf of Mexico reaches it by a much longer circuit, and perhaps a very small portion by the counter currents at Cape Florida.—The surface velocity of the Gulf stream appears to be variable, being probably affected by the wind; but although we have as yet no observations of the velocity at various depths, it is safe to assume a much greater constancy for the bulk of its waters. According to the chart of the Atlantic ocean published by the hydrographic office in Washington, the rate of the current in the straits of Florida is from 1 to 4 m. per hour; in the narrows of Bemini, from $1\frac{1}{2}$ to 5 m.; off the coast of Georgia, $1\frac{1}{2}$ to 4 m.; off Cape Fear and Cape Hatteras, $1\frac{1}{2}$ to $3\frac{1}{2}$; off Chesapeake bay, 4 m.; and in the longitudes of Nova Scotia and Newfoundland, between 2 and 3 m. Mr. Findlay estimates it rather less: about $2\frac{1}{2}$ m. per hour in the narrows of Bemini, $2\frac{1}{2}$ off Charleston, $1\frac{1}{2}$ to 2 off Nantucket, and a little over 1 m. S. of the Newfoundland banks. Accurate observations at all seasons and at various depths, though difficult to make, are very much needed.—The further course of the Gulf stream after passing the banks of Newfoundland is involved in some doubt, as has been mentioned in speaking of the general system of currents of the Atlantic ocean. That water of a higher temperature than is due to the latitude reaches the northern and eastern shores of the Atlantic appears to be universally admitted. Capt. Strickland seems to have been the first to attribute this fact to the extension of the Gulf stream, and was supported in this opinion by the authority of Humboldt and Scoresby, the latter having made a large number of observations of temperature in the Arctic ocean. Leopold von Buch, struck during his travels along the coast of Norway with the luxuriance of the vegetation in so high a latitude, the high level of the line of permanent snow, the freedom from ice of the harbor during the greater part of the winter, &c., attributed to the Gulf stream the office of bringing heat to these coasts; and his reasoning appeared to Humboldt "perfectly convincing." Gen. Sabine, during one of his voyages for pendulum experiments, made numerous observations in the Gulf stream proper, and in its supposed extension across the ocean, and along the coasts of Europe, south of England and Africa, and was convinced that both were one and the same system. Rennel was the first to shake this belief, at the time almost universal, attributing the whole easterly and northerly movement of the waters to a superficial drift produced by the prevailing S. W. winds. It must be remarked that he ignores entirely the effect of the rotation of the earth,

and of the heating and cooling of the waters at the equator and pole, joint causes which Arago was probably the first to exhibit, without, however, entering into their discussion. In very recent times the partisans of both opinions have shown a renewed activity, partly in connection with arctic, and partly with deep-sea explorations. It was in reference to the former that Dr. Petermann gave his opinion as follows: "Instead of a weak and insignificant drift from Newfoundland toward Europe, as heretofore represented, I consider the northern part of the Gulf stream one of the mightiest currents of the world, although comparatively slow, not very perceptible on the surface of the ocean, and therefore of no great moment to navigation. I do so because ocean currents have to perform other functions than merely those of a strong surface stream. In that view I conceive the Gulf stream to be a deep, permanently warm current from Newfoundland to the coasts of France, Great Britain, Scandinavia, and Iceland, up to Bear island, Jan Mayen, and Spitzbergen; and along the western coast of the latter up to the 80th degree of north latitude, thence to Nova Zembla into the polar sea, passing the northernmost capes of Siberia and the New Siberian islands, where it appears on the charts as the Polynia of the Russians, . . . its influence being felt perceptibly even as far east as Cape Yakan." Numerous opponents have risen against these assertions, among them Mr. Findlay, who contends that the Gulf stream proper has not sufficient width and depth to reach the coast of Europe; that at its slow rate of progress it must lose all its heat during the passage; that after reaching Newfoundland it is totally annihilated by the Polar stream, and cannot be perceived beyond; that the Gulf stream has nothing to do with the climate of northwestern Europe, which is affected only by the general drift of the North Atlantic ocean. To this Dr. Petermann replies that the Gulf stream is no doubt reinforced by a drift corresponding to it in direction, in the same way that a river is swelled by tributaries, without for all that losing its individuality and its name. Prof. Carpenter, in discussing the results of his deep-sea temperature observations, doubts if the Gulf stream sends any but a very small and superficial contribution to the northern seas, and is supported by the companion of his researches, Mr. Jeffreys, on zoological grounds, the latter rather premature, since we are still at the dawn of our knowledge of the deep-sea fauna. Dr. Petermann now took a very important step in the question; the differences of opinion resting chiefly on belief and theory, he undertook to collect all the observations of temperature of the water in the North Atlantic and construct charts of isotherms for every month in the year. The large amount of materials buried in Maury's wind and current charts were made available by much labor; the observations pub-

lished by the Dutch government and by the Scottish and Norwegian meteorological societies, the records of sea temperatures of some of the transatlantic steamship lines, those of the Danish ships sailing to Iceland and Greenland, collected by Admiral Irminger, and those of various arctic expeditions, furnished a considerable array of data. Of the twelve monthly charts contemplated, two only have been published, those for January and July. The chart for July exhibits the core of the Gulf stream at a temperature of 81.5° extending northward as high as lat. 38° , and with a temperature but slightly decreased as high as lat. 40° , and as far east as lon. 43° . That it is not a mere drift is shown by the lower temperatures south of this tongue, which in January is shortened as might be expected. At Newfoundland the curves show the inroad made by the polar current, but in a less marked manner in winter than in summer. In July the polar current brings water at a temperature of 45.5° down to lat. 50° , while further east the Gulf stream water has still 65° in the same latitude. To the east of Newfoundland the isotherms set toward the north with two bends more marked in summer than in winter. In July the isotherm of 54.5° advances toward Iceland and the Faroe islands to lat. 61° . The warmer water follows not only the W. coast of Iceland, but passes round to the N. side of it, while on the E. and S. coast the polar current preponderates, producing a temperature lower by 5° or 6° . Between Iceland and the Faroe islands warm and cold bands of water alternate, the result of the struggle between the Gulf and polar streams, the latter carrying drift ice much further south in this region than anywhere else east of Iceland, and reducing the temperature of the water at the Faroe islands to a lower point than it has on the W. coast of Iceland, where the winter climate is not as severe as it is in many parts of New England. The isotherm of 36° , which touches Iceland in winter, extends at the same season beyond North cape; the sea at Fruholm, North cape, is in January still at a mean temperature of 37.9° . Observations are wanting to show the further extension of the Gulf stream toward the northeast. It is met by a polar current running in the opposite direction, and cut by it into two branches, of which one runs along the W. side of Spitzbergen, the other eastward of Bear island. The further progress of this branch, which is the main one, is not known. The branch of the polar stream separating the two arms sets toward the coast of Greenland, where it is said to form a bight in the drift and field ice, reaching nearly to the coast.—In high latitudes deep-sea temperatures show in many localities an anomaly in this, that the coldest are observed near the surface, and that there is an increase of temperature with depth. Observations in the Antarctic ocean have shown the same phenomenon. It is frequently explained by comparison with the same phenomenon in

fresh water, the maximum density of which is 7.2° higher than the freezing point. Although with regard to salt water the question appears still unsettled, the weight of evidence seems to point to an increase of density in the latter down to the freezing point. In that case the colder surface temperature might be attributed to the stratum of water from melting ice, floating over warmer layers because of less density.—Some light has been afforded as to the course and origin of the currents in the northern seas by the driftwood and other materials thrown by them on the shores. The northern coast of Spitzbergen is covered with immense accumulations of driftwood, bark, pumice stone, &c.; among them Torrel found a large bean of *entada gigalobium*, a product of tropical America found on all the shores washed by the Gulf stream, from Florida to Norway. These beans are found even in the Danish colonies on the W. coast of Greenland, where they are known under the name of *vettenyrer* or witches' kidneys. The seeds of *mucuna urens* and *mimosa scandens* are generally found with the former. The driftwood was pronounced by botanists to be nearly all Siberian larch, thus proving that the sea is open in summer as far as the mouths of the great Siberian rivers, and that in the locality mentioned the waters of the Gulf stream mix with those of the polar current. The saltness of the water in different parts of the ocean, as determined by Prof. Forchhammer, was laid down on a chart by Dr. Petermann, and found to agree remarkably well with his temperature charts, the warmer or Gulf stream water being more salt than the colder or polar stream. From all the points discussed in his paper, Dr. Petermann draws the following conclusions: 1. The Gulf stream extends along the North American coast with a temperature of 77° and upward as far as lat. 37° ; a temperature in winter higher than the temperature of the air in Africa under the same latitude, and higher than the temperature of the water at any time under the equator. 2. The Gulf stream turns away from the American coast in lat. 37° to 38° toward the east beyond the banks of Newfoundland to lon. 40° W., where it still has a temperature of about 75° in July and about 66° in January. From there it proceeds to the northeast, surrounding Europe to the Arctic and the White sea with a permanent current of warm water, still having a temperature of 37.8° in a latitude in which in Asia and America the mercury remains frozen for months. 3. The velocity and strength of the stream are still imperfectly known. Findlay estimates the time for the water to travel from Florida to Europe at one or two years; Dr. Petermann, at two months. 4. The Gulf stream must be a deep and voluminous body of water, keeping away the polar ice from the coasts of Europe. The polar current presses at three places against it, E. of Newfoundland, E. of Iceland, and at Bear island. 5. These polar currents make a much

deeper impression in the Gulf stream in summer than in winter. 6. In winter the Gulf stream is cut in upon much less. The polar streams are then less powerful, the polar ice being fast in the north. This is shown by Mr. Redfield's observations on the drift ice off Newfoundland. Of 100 cases of ice seen, 87 occurred in April, May, June, and July; of the remaining 13, there were 7 in March, 8 in August, 2 in February, and 1 in January; none at all in September, October, November, and December. 7. The relations of temperature within the Gulf stream itself are about the same in winter and in summer; the fluctuations between its maximum and minimum would be only about 9°.—The thermometrical results of the deep-sea expeditions in the European seas in the steamers *Lightning* and *Porcupine* in 1868, '69, and '70, have been used by Prof. Carpenter, under whose charge the observations were made, for a theory of ocean currents based on the heating and cooling of the water at the equator and pole respectively. The remarkable fact was brought out during the first cruise that in the channel between the Faroe islands and the N. coast of Scotland a warm area exists on the bottom in close proximity to a very cold one. The warm area, S. W. of the Faroe islands, had a temperature of 41.4° at a depth of 767 fathoms; the cold area, only 20 m. distant, between the Faroe and Shetland islands, only 29.7° at 640 fathoms, the surface temperature being the same. Near the Rockall bank off the W. coast of Ireland the temperature of 41° was found to extend to 775 fathoms, with a bottom temperature of 37.4° at 1,400 fathoms, and off the bay of Biscay to 800 fathoms, with a bottom temperature at 2,435 fathoms of 36.5°. Prof. Carpenter remarked on these results that the elevation of temperature in the warm area above the isotherm of its latitude could only be attributed to a supply of water from the southwest; and that the Gulf stream, meaning the warm water coming through the narrows of Florida, if it reached this locality at all, which he considers very doubtful, could only affect the most superficial stratum; and that the same could be said of the surface drift caused by southwesterly winds. He comes to the conclusion that the presence of the body of water ranging from 100 to 600 fathoms in depth, and the range of temperature of which is from 48° to 42°, can scarcely be accounted for on any other hypothesis than that of a great general movement of equatorial water toward the polar area, of which the Gulf stream constitutes a peculiar case modified by local conditions. The arctic stream in the cold area is also a peculiar case of the general movement of the polar water toward the equator; for it is forced to pass through this, the deepest channel between Iceland and Europe, and pressed toward its S. E. shore on account of the channel's oblique position with regard to the N. and S. flow of the water. Prof. Car-

penter is inclined to think that the Arctic ocean is insufficient to supply cold water enough for so great a reduction of temperature as is found in the body of water below 1,000 fathoms in the Atlantic basin, and thinks that antarctic water may also flow in past the equator as far as the tropic of Cancer; a question rather difficult to settle in the present state of our knowledge, since all we know is that under the equator bottom temperatures have been observed of 35.2° at 1,806 fathoms, and 33.6° at 2,306 fathoms. The best evidence adduced by Prof. Carpenter for the flow of polar water on the bottom toward lower latitudes is based on his deep-sea temperatures of the Mediterranean. This closed body of water communicates with the Atlantic through the strait of Gibraltar alone, and that is too shallow to allow of a communication between the deep waters of the two basins. The Mediterranean goes down in some parts to 2,000 fathoms. The surface is hot in summer, as high as 78° sometimes, but the hot layer is shallow, 10° or 15° being lost in the first 30 fathoms. At 100 fathoms the temperature is generally 54° or 55°; beyond that depth no further reduction was observed; "whatever the temperature was at 100 fathoms, that it was at the bottom;" and this temperature is found to be the permanent temperature of the surface of the earth in that latitude. The same observer concludes that the ocean is subjected to two different circulations: a horizontal one produced by the action of the wind, the Gulf stream being an example of it; and a vertical circulation dependent on opposition of temperature. V. LIFE IN THE ATLANTIC OCEAN.

—1. *Vegetation*. The flora of the ocean, or *neraea*, as it has been called, is confined to a narrow belt along the shores and to the surface layer of water in mid-ocean, a strong light being necessary to its existence. With the exception of a few species of the family of *scottracaea* (eelgrass, turtlegrass, grasswrack), the whole submarine vegetation belongs to the algae, plants of low organization. The limits of depth to which certain families, genera, or species are confined, are much more definite than they are for animals; they have been called zones by Edward Forbes, characterized by the prevailing types growing in each. Commencing at the surface, he called littoral zone the region between high and low water, which on rocky shores is characterized by a luxuriant growth of *fucaceae* principally, of which different species form further subdivisions of the zone, according to their preferences for a longer or shorter exposure to the air. Below low-water mark the laminarian zone begins, and extends to 4 or 5 fathoms; in it are found in abundance the *chondrus crispus* or carrageen, the thong weed (*himanthalia*), and the tangle or devil's apron (*laminaria*). In the lower part of this zone are found the red and purple seaweeds, many of them of great delicacy and beauty. The next zone is that of the

corallines, so named from a family of seaweeds having their tissues filled with lime and simulating small corals. As a general rule seaweeds do not grow much deeper than 8 or 10 fathoms, though there are exceptions; thus the gigantic *macrocystis pyrifera*, found growing in 40 fathoms, and rising to the surface at an angle of 45°, and streaming on it for a distance of several ships' lengths, has been estimated to have a total growth of 700 feet. Low forms of corallines have been found at more than 200 fathoms, and *diatomaceæ* at all explored depths. The geographical distribution of seaweeds depends much on temperature and currents. The *laminaria*, for instance, prefer cold water, the *sargassa* the warmest. The largest forms are found in colder water, as the *laminaria* in the north, the *macrocystis*, *Lessonia*, *Durvillea*, &c., in the south. As examples of the influence of currents on the distribution, we may take *padina pavonia*, a West Indian species, not found in America N. of the Florida keys, but carried to the S. shore of England probably by the Gulf stream. The *macrocystis* and other large antarctic seaweeds luxuriate about Tierra del Fuego and the Falkland islands; they are carried far toward the equator by the Peruvian current on the W. coast of South America, while they are kept back on the E. coast by the southerly extension of the Brazilian current. A very remarkable feature of ocean vegetation is the Sargasso sea. This name is commonly used to designate a region of the Atlantic covered by a peculiar floating seaweed, either in tangled masses of considerable extent, compared by some writers to floating prairies or submerged meadows, or simply in scattered sprigs. Columbus, as is well known, passed through these fields of seaweed in his first voyage, to the great alarm of his companions, who from previous association would naturally imagine a connection between seaweeds and rocks or shoals. Since that time, for nearly four centuries, observation has shown that the geographical position and the abundance of these plants remain essentially unchanged. Humboldt found that the gulf weed, as it is generally called, because found also in the Gulf stream, was distributed in two principal masses, the largest situated a little to the west of the meridian of Fayal and between the parallels of 25° and 36° N. North-west winds are said to carry it sometimes to the latitudes 24° to 20°. The second or lesser bank is less known, according to the same author, and occupies a space between the Bahamas and Bermudas. Capt. Leps of the French navy has investigated the subject more recently, and places the principal bank between lon. 29° and 45° W., and lat. 21° and 33° N., with smaller scattered masses extending several degrees beyond these limits on all sides. The smaller bank he found not so well defined, the denser portion forming a band extending to the N. E. of Porto Rico and to the

latitude of Bermuda. The Sargasso sea corresponds to the great centre or eddy of the North Atlantic system of currents, of which the Gulf stream forms so important a part. The botanical name of the gulf weed is *sargassum bacciferum* (Agardh), not *sargassum natans*, as it is usually called in books of navigation, which is a species growing on rocks in the West Indies. It is generally found in sprigs a few inches long, with a main stem branching into secondary ones; the main stem has frequently a decaying end, while the other gives rise to fresh-growing leaves; but there is never any trace of root or place of attachment. Between the leaves, which are elongated and sharply serrate, small round air vessels, the size of currants, are supported on short peduncles. These air vessels or floats are vulgarly taken for the seeds or fruits; hence the name, derived from a Portuguese word meaning grapes, and the French names of *raisins de mer* and *raisins du tropique* (sea grapes and tropic grapes). Far from being seeds, it is a singular fact that the plant has never been observed to produce a fructification, and that it propagates only by division. Prof. Agassiz has observed that deprived of its floats the plant sinks. Humboldt, in his personal narrative, thought it might possibly grow on an undiscovered bank of 40 or 60 fathoms depth. This opinion he afterward abandoned; but as it is still current among some persons, it may be stated here that such a bank in mid-ocean would have revealed itself by discoloration of the water before now, and to produce the immense masses of floating weed would have to be of considerable size; besides, soundings in different parts of the Sargasso sea have revealed a very great depth of the ocean in that part. It is furthermore well known that fucoids grow only in very moderate depths, the greater number of species being confined between tide marks. Humboldt in later works adopted the more probable supposition that the gulf weed originates and propagates where it is found. To this he was led by the observations of Meyen, who examined several thousand specimens during a voyage across the Sargasso sea, and found them uniformly destitute of roots or fructifications. Robert Brown, however, thought the question of origin still obscure, but that the theory of propagation by ramification and division was highly probable. He thought it possible that it might have originated from some nearly allied species in the gulf of Florida, *fucus natans* for instance, afterward permanently modified by the circumstances in which it had been placed for ages. Harvey, a high authority in the knowledge of seaweeds, who explored the shores of Florida and examined the fresh gulf weed, is also clearly of the opinion that it propagates only by division, whatever may have been the origin of the species. The gulf weed harbors a peculiar fauna consisting of fishes, crustacea, mollusks, and polyps. Among the fishes, a

small *chironectes* is most abundant, which constructs a peculiar nest for its eggs, by fastening several sprigs of gulf weed together. It has been said that no similar accumulation of floating seaweed was known in any other part of the world; but a Sargasso sea, bearing the same relations to the North Pacific currents which the Atlantic one bears to the Gulf stream, is found to the northward of the Sandwich islands, and appears to occupy a still larger space. It is, however, very little known.

—2. *Animals*. The cold seas seem to be more favorable to the development of mammalia than the warmer ones. Thus the highest in the scale among those inhabiting the ocean, the polar bear, is found in the furthest north, and is only an occasional visitor of the shores of the Atlantic proper, when carried along by the ice. The seal family is also most numerous represented in the arctic regions; the North Atlantic and Arctic harboring only earless seals, the South Atlantic eared seals likewise. One or two imperfectly known species are reported in the West Indies, and one in the Mediterranean. Of the manatees, which are more fresh-water than marine animals, two species are found on the American tropical shores and one in Africa. The walrus retreats from persecution further north every year, so that its original distribution is uncertain. The same may be said of some of the whales, particularly of the right whales, two species of which have been described from the north, the one confined to the frozen ocean, the other, almost extinct, inhabiting the region between this and lat. 40°. No right whales are found in the tropics, but a third species is found south of the tropic of Capricorn. The finback whales appear to frequent all the oceans except the frozen regions. The sperm whale is found chiefly in the warmer seas, S. of lat. 45° N.; it is said to pass Cape Horn, but not the Cape of Good Hope. Of the smaller cetaceans known as porpoises, the genus *phocaena* is chiefly northern, *delphinus* almost universal.—Of the families of birds frequenting the Atlantic ocean, the ducks have their greatest development in the far north, visiting the temperate regions in winter; they are much more scantily represented in the South Atlantic. The auks and divers are also northern birds, and are in a great measure replaced by the penguins in the southern cold regions. The pelican family flourishes best in the tropics, where it has its large representatives, the pelicans, frigates, phaetons, &c.; while cormorants and gannets extend as far as the cold temperate zone. The petrels, the most pelagic of birds, are seen in all latitudes, but with a strong preponderance in the southern cold region. The giant of the tribe, the albatross, visits the coast of South America as far N. as the Rio de la Plata. The gulls and terns are seen everywhere.—Of reptiles, the Atlantic has only four species of turtles, inhabiting the warmer seas, and only occasionally carried

to higher latitudes by warm currents. Marine snakes, common in the Pacific, are entirely absent in the Atlantic.—The North Atlantic is perhaps of all seas the best provided with useful fishes. The gadoids or cod family, the pleuronects (halibut, turbot, &c.), the herrings and mackerels are nowhere else in such abundance and excellence as on both sides of that ocean. In the tropics the large *serranus* (groupers) are a characteristic group. The bright-colored tropical fishes, such as chetodonts and others, seem to be confined to the same limits as the corals, the coasts of America bathed by the equatorial current. Large representatives of the mackerel tribe, the *coryphæna*, improperly called dolphin, and the flying fishes, are the most common inhabitants of the high seas.—Of crustacea peculiar to the Atlantic, the king or horseshoe crab of North America deserves mention, only one other species of the genus being known, in the Molucca islands. The mollusks are nearly all different in the Atlantic from those in the other oceans, even when so slender a barrier as the isthmus of Panama is interposed. In the Fœgian and South African provinces alone is there a gradual merging through a common fauna with that of the Pacific and Indian oceans. Similar remarks might be made with regard to most of the radiates. Most of the known living crinoids inhabit the Atlantic. The corals are distributed altogether in accordance with the warm current. The W. coast of Africa, washed by comparatively cold currents, has scarcely any. The coast of South America, receiving warm water from the equatorial current, has a greater abundance, though their growth is checked by the fresh water and mud of the great rivers. But they flourish in the West Indies and as far north as Bermuda, under the influence of the Gulf stream and other warm water currents. The West Indian coral fauna is destitute of true *fungiæ* and of *poecillipora*, both so common in the Pacific. It has on the other hand a great abundance of *gorgoniaceæ* (sea fans, sea feathers).—For ocean life at great depths, see DREDGING.

ATLANTIS, according to the tradition of the Greek geographers (in which some recognize a vague knowledge of America), a large island in the Atlantic ocean, to the west of the N. W. coast of Africa and the pillars of Hercules. It was fabled to possess a numerous population, begotten by Neptune of mortal women. The sea kings of Atlantis were said to have invaded the west of Europe and of Africa, and to have been defeated by the Athenians and their allies. The inhabitants finally became desperately wicked, and the island was swept away by a deluge. Plato mentions the island in his *Timæus*. On the old Venetian maps, Atlantis is put to the west of the Azores and Canaries.

ATLAS, in Greek mythology, son of Japetus and Clymene, and brother of Epimetheus and Prometheus. Defeated with the other Titans by Jupiter, he was condemned to bear heaven

on his head and hands. Some stories represent him as a great astronomer, king, and demigod, who first taught man that heaven had the form of a globe. Ovid relates that Perseus, having been refused shelter by Atlas, changed him by means of the head of Medusa into Mount Atlas, on which rested the firmament.

ATLAS (Moorish, *Adrar, Dir, Jebel Tidla, or Jebel Adla*), a mountain system of N. W. Africa, forming the watershed between the Mediterranean sea and the Sahara. It extends under various names from Cape Ghir on the Atlantic to the gulf of Gabes (or Lesser Syrtis), about 1,200 m. It is generally divided into the Greater and Lesser Atlas, and a middle table land. The Lesser Atlas is the range nearest the seacoast; the Greater borders on the desert. But this division, originated by Ptolemy, is unknown to the natives, and no real line of division can be ascertained. In Morocco the Atlas is a continuous chain from which the country slopes N. W. and S. E. toward the sea and the desert; and here it attains its greatest altitude, some of the peaks, as Jebel Miltzin, approaching, and others exceeding 12,000 ft. in height. The height of the mountains generally diminishes toward the east. The middle part in Algeria is divided into the range of the Tell, between the Mediterranean and the Shott plateau or salt swamps, and the range of the Sahara, between the plateau and the desert. The Tell consists of single groups of mountains separated from each other by wide valleys, of which 11 are counted from W. to E. In Algeria the highest point is Jebel Sheliha, S. of Constantine, upward of 7,000 ft.; and Jurjura or Jerjera, between Algiers and Constantine, is upward of 6,000. The chain mainly follows a direction parallel to the coast, but then turns S. E., and takes the name of Jebel Aures, and approaching the coast again, it penetrates into the territory of Tunis. There are several passes, of which the chief is in the Jurjura, the famous Biban, a long, narrow valley bordered by rocks rising precipitously 150 to 200 yards. In the western part of the range is the Bebaoum pass, leading to Tarudant in Morocco, also bounded by perpendicular rocks and precipices. Another defile, frequented by caravans, leads from Fes to Taflet. East of the city of Morocco snow covers the summits all the year; in Algeria it falls in September and melts in May. The climate is generally very salubrious. The sides of the mountains are covered with forests of oak, cedar, pine, pistachio, cypress, olive, and oleander. The Kabyles occupy the habitable parts of the Atlas. The wild animals are the lion, panther, guepard, hyæna, boar, and bear; and several species of monkey are also found. None of the rivers are navigable, and many are only winter torrents. The Tensift and Draa flow into the Atlantic; the Taflet is lost in the sands; the Shelliff, the Seybuse, the Kebir, the Rumel, and the Mejerda flow into the Mediterranean. According to a description of a branch of the

Greater Atlas from S. to N. near Jebel Miltzin given by the English naturalist Washington, the geological constitution of this part of the range is gneiss, schist, red sandstone, transition limestone, and marl. Capt. Rozet gives the following description of the Lesser Atlas after a careful study: The country of Algeria, covered by branches or plateaus of the Lesser Atlas, is composed of transition schist, gneiss, blue limestone similar to English lias, deposits of alluvium, trachytic porphyry, diluvium, and other deposits. The prevailing rock is a whitish green or blue schist in deformed layers, broken up into numerous fissures filled with white quartz and oxidized iron. The limestone enclosed in the schist is of a saccharoid texture, and of a gray or dark blue color; it forms considerable masses in the mountains of Algeria. The schistose stratum contains garnet and anthracite; it gradually changes to mica schist and then to gneiss. The alluvium is composed of horizontal strata of clay, marl, and rounded pebbles. The mineral wealth of the Atlantic Atlas is but imperfectly known. The Greater Atlas seems to be crossed by veins of copper, iron, tin, antimony, and perhaps gold and silver. The Lesser Atlas has mines of lead and iron; silver, copper, mercury, and plumbago are also found. There are many mineral springs in different parts.

ATMOSPHERE (Gr. *ἀτμός*, vapor, and *σφαῖρα*, sphere), or **Air**, the gaseous envelope of a celestial body or of the earth. At present we know that the sun and planets possess atmospheres, and the revelations of the spectrum begin to show what these atmospheres consist of. That of the sun contains, besides hydrogen and other gases, the vapors of solids and liquids, so highly heated that iron vapor is one of its principal constituents. The atmospheres of Venus and Mars appear similar to that of the earth; those of Jupiter and Saturn, Uranus and Neptune, differ so much from our terrestrial atmosphere, that it is highly probable that these planets possess so high a temperature as not only to keep many solids in the state of vapor, but even to be slightly self-luminous. The moon shows no trace of an atmosphere. When we consider the great amount of oxygen and water combined with the solid portions of our earth's surface, it is highly probable that the volcanic scoræ and lavas of the moon have long ago absorbed all the air and water which may once have enveloped it.—The atmosphere has been the principal agent in transforming the surface of our earth into what it is: first by disintegrating the rocks; then, in connection with solar heat, starting vegetation; then causing the decay of organic substances, and so forming soil for more profuse organic growth, giving sustenance for the animal kingdom; and finally fulfilling all the functions necessary for the development of all forms of life. The functions of the atmosphere are: to act as the principal conductor of sound waves; to moderate the solar heat, admitting

its reception during the day, and preventing too rapid a loss of it during the night; to carry the waters of the ocean in the form of clouds or vapors over the land; to serve as a mechanical force; and last, but not least, to diffuse the element, oxygen, which sustains the life of all conscious beings. 1. *Mechanical properties.* The first property of the air is weight; hence it is attracted by the earth, and therefore it exerts a pressure, not only downward, but, according to the law of fluids, sideways, upward, &c., as by the mobility of fluid particles any pressure is transmitted in all directions. The direct proof of the fact that the air has weight is, that when it is compressed in a strong flask, the flask is heavier than before. If this flask has a capacity of 100 cubic inches, and 100 more cubic inches of air are pressed in by means of a compression pump, the flask will be found to have gained 81 grains in weight. This is the result when the barometer stands at 30 inches, and the thermometer at 60° F.; but as the air expands $\frac{1}{4}$ part for every inch of decrease in the barometer, and $\frac{1}{17}$ part for every degree of increase of the thermometer, the weight will be so much less if the barometer is lower or the thermometer higher, and *vice versa*. The atmosphere having weight, and being perfectly elastic, causes the lower strata to be denser than the upper. Consequently, if the experiment described be performed on the top of a high mountain, we shall find the weight of the 100 cubic inches of air considerably less than 81 grains; at a height of 14,282 feet the air will weigh only half as much; at twice that height it will weigh only one quarter; at three times, one eighth, &c. In general the law is, that while the height increases in an arithmetical ratio, 1, 2, 3, 4, 5, the weight, and consequently the pressure, decrease in a geometrical ratio, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, &c. On this property is founded the system of estimating heights by determining the pressure of the air, either by weighing by the barometer, or by noticing the temperature at which water boils. Near the surface of the ocean water boils at 212°; if we go 550 feet upward, it will boil at 211°; 1,100 feet, at 210°; 5,500 feet, at 202°; 11,000 feet, at about 192°. The cause of this difference is, that in order to boil water the heat must be great enough to cause the expansive force of the vapor or steam to overcome the atmospheric pressure, and that thus in ascending, this pressure becoming less, a less amount of heat is required. This method, however, is only a rough approximation, and is now abandoned for more delicate methods.—The atmosphere, like all gaseous bodies, possesses elasticity in a most remarkable degree. The effect of this elasticity is seen in the unroofing of houses and bursting outward of windows in hurricanes. A partial vacuum being produced by the rotary motion of the hurricane, the air within expands and lifts off the roof, or bursts open the doors and windows. A similar effect is observed in the ex-

pansion of air confined in a bladder, and taken from a low level to a great height. The external pressure being reduced, the air within tends to expand to the same degree of rarity as that without, and with such force as to burst the bladder. It is this property, possessed in the greatest perfection by the gaseous bodies, that renders air so excellent a material for springs, air beds, &c.—The impenetrability of air is its property of preventing another body occupying the space where it is. The diving bell is a good illustration of it, as also of its elasticity; for when sunk to the depth of 84 feet, the water will be forced in, so as to half fill it; at the depth of 100 feet it will be three quarters filled; on drawing it up the air will expand and drive out the water again. This also shows that air may be condensed and expanded by mechanical force. A remarkable law prevails, called after its discoverer the law of Mariotte, to the effect that the volume of the air is inversely proportional to the pressure employed, and therefore also to the reactive pressure exerted by the air on the vessels in which it is confined. This pressure, which is the ordinary condition of the atmosphere amounts near the surface of the ocean to about 15 pounds to the square inch, is thus doubled or tripled if we introduce double or triple the amount of air in the same space, as in the experiment above referred to for weighing the air. Mariotte's law, however, does not hold for excessive pressures, say of 25 or 50 atmospheres, when the volume is not exactly inversely proportional to the pressure; our atmospheric air and most other gases are condensed more for a given pressure, while hydrogen gas forms an exception, and is condensed less than the amount required by Mariotte's law. The shape of the atmospheric envelope of our planet is of course spheroidal like the earth, only it is more likely that its upper surface is still more depressed at the poles than the earth itself, while the air is there colder, consequently more condensed and heavier, than at the equator. The attempts to determine the absolute height of the atmosphere have given different results, according to the different data taken as the basis of the calculation. The most trustworthy data are those founded on the time that on a clear evening the last twilight reaches the zenith in connection with the laws of refraction and reflection of light; this has given as result a height of about 40 miles for the extreme trace of atmospheric air, in so far as these laws of refraction act in an appreciable manner. It is most likely, however, that the rarefaction expands much further, till at the utmost limit of some thousands of miles it mingles and becomes identical with the interplanetary medium or so-called ether, which, according to some of the latest opinions, is only infinitely rarefied atmospheric air, or inversely, our atmospheric air is nothing but the interplanetary medium, condensed by gravitation on the surface of our planet. The pressure of the atmosphere is

also made apparent by removing the air from the interior of any tube, the lower end of which is immersed in water or any other fluid. This fluid will be pressed up the tube to a height corresponding to the pressure upon its surface. If this be at the level of the sea, water will rise 33 feet and mercury 29 inches. The common suction pump is but such a tube, furnished merely with a piston for lifting out the air, and then the water follows it. The power required is of course equal to the weight of the column of water to be lifted. The pressure of the air is also well illustrated by the common leather toy "sucker"—a disk of soft leather, with a string knotted at one end passed through its centre. When moistened and applied to any smooth surface, care being taken to expel the intervening air, it is attracted to it by the external pressure. By the same principle the patella or limpet, and some other shell fish, hold fast upon the smooth rock. So great is this pressure, that the force exerted upon the body of a moderate-sized man must be about 15 tons—sufficient to crush him, as it inevitably would, if applied to only a portion of the body, but quite harmless when pressing with perfect elasticity everywhere alike, from the external parts inwardly, and from those within outward. Let the pressure be taken off from any portion, as by the cupping instrument, and one is immediately sensible of the power that is exerted upon the parts around, painfully pressing them into the vacant space of the instrument; or if taken from the whole body, as is the case with an *aéronaut* in a balloon at great height, the result may be by the expansion of internal organs prove fatal. Inversely, a great increase of atmospheric pressure may be equally injurious and even fatal, as experienced by divers at great depth under water, or by the workmen engaged in labor in the caissons now employed in forming a foundation for subaqueous structures. 2. *Physical properties.* The most important physical property of the atmosphere is its expansion by heat and contraction by cold. The amount of this expansion or contraction is $\frac{1}{480}$ of its bulk at 32° F. for every degree of temperature above or below that point. At very low degrees of temperature, however, this law does not hold, and cannot do so, as is evident from the fact that if it were absolute the air when cooling to 492° below 32° , that is, at -460° F., would be condensed to nothing. The latter temperature has for this reason been accepted by Clément and Desormes as that of absolute cold, while according to Pouillet the temperature of the outermost limits of our atmosphere is equal to that of the interplanetary space beyond, being about 230° below zero. The expansion of air by heat is easily exemplified by heating air confined in a bladder. Its expansion soon swells the bladder and causes it to burst. As its bulk increases, its density diminishes. The colder and heavier air around it lifts it up. On this principle were constructed the first balloons. It is this prin-

ciple also that gives rise to the currents of air or wind, the colder air flowing along the surface to fill the spaces left by the ascending warm air. Thus the trade winds blow from the temperate regions toward the torrid equatorial belt. The whirling tornado, and all the phenomena of the winds, owe their origin to local heating and rarefaction of the atmosphere. The rays of the sun pass through the upper strata of the atmosphere, imparting to them little heat. This the air receives chiefly near the surface. As we ascend, the temperature diminishes one degree for every 300 or 400 ft. Near the equator perpetual snow covers the mountains at the height of 15,207 ft.; in lat. 60° it is found at 8,818 ft., and in 75° at 1,016 ft. The main cause of this is not that the solar rays possess less heat in the higher regions, as the contrary has been proved, but that the portions of the earth's crust projecting far up into the atmosphere, as is the case with high mountains, possess less of the interior heat of the earth, being more subject to cooling by radiation, which has caused their temperature to descend to such a very low degree, that even a midday tropical sun cannot raise it to 32° F. Another physical property of the atmosphere is its refraction and reflection of light. If the sun's rays did not illuminate the mass of the atmosphere, it would be of a black color; but a partial refraction of the most refrangible rays takes place, and this gives the blue color to the sky, while that of the clouds comes from the reflection of the light upon the particles of vapor floating in the atmosphere. This blue color is too faint to be perceived in any small quantity of air; it is only the great depth of the atmosphere that makes it visible, as the color of the ocean is only apparent when the waters are seen in mass. 3. *Chemical properties.* The atmosphere consists chiefly of a mixture of three gases, oxygen, nitrogen, and carbonic acid, with a very variable quantity of watery vapor. The normal quantities are by weight 23.2 per cent. oxygen, 76.7 nitrogen, and about 0.1 carbonic acid, while the watery vapor varies from almost utter absence to saturation or more than 80 per cent., according to locality, climate, season, and other circumstances. To this must be added the fact that the atmospheric oxygen is found in two different conditions according to circumstances, one being the neutral state or ordinary oxygen, the other its active condition, when it is called ozone. This differs from ordinary oxygen, first, by being more condensed so as to be one half heavier, 100 cubic inches of ordinary oxygen weighing 32 grains, while the same bulk of ozone has a weight of 48 grains; secondly, by causing many chemical reactions which ordinary oxygen is incapable of producing. It is also a most powerful disinfectant, one part of ozone purifying 3,000,000 parts of putrid air, by burning up as it were the miasmatic exhalations. In the arts it has already been applied as a bleaching and purifying agent. Its great

chemical activity makes it, when present in large quantity, hurtful to animal life, by its very irritating action on the respiratory organs. A heat of 500° F. reconverts it into ordinary oxygen. Nature produces it continually by the electric discharges during thunderstorms, by the odors of flowering plants under the influence of light, by vegetation in general, and by some kinds of decay. Its formation is chemically explained by the fact that the molecule of oxygen consists of a double atom, while in the molecule of ozone three atoms occupy the same space. (See OZONE.) In unhealthy localities little or no ozone is present, but in the vicinity of large cities ammonia is found, and nitric acid and nitrate of ammonia are generated in thunderstorms by the chemical combination of nitrogen and oxygen induced by the electrical spark. These, which may be regarded as accidental impurities, are soon dissipated in the great bulk of the atmosphere, precipitated upon the earth, washed down by the rain, and decomposed by the ozone. The proportions of the three elements of the air hardly vary, whether this is taken from the summits of the highest mountains, or from extensive plains; nor are they affected by season, climate, or weather. In closely confined places, exposed to putrescent exhalations, the purity of the air is necessarily much affected; the proportion of oxygen diminishes, and mephitic gases, as sulphuretted hydrogen and more carbonic acid, are introduced. Prof. Nicol gives an analysis of air collected in a filthy lane in Paris, in which the oxygen constitutes 18.79 per cent. only, instead of 23 per cent.; nitrogen was present to the amount of 81.24 per cent.; carbonic acid, 2.01; sulphuretted hydrogen, 2.99 per cent. Such air contains also many other vapors, inorganic as well as organic, which formerly escaped detection, but which at present, by the modern refinements in the analysis of gases, may be determined. That the air is a simple mixture and not a chemical compound of its elements, is proved by the fact that water, long exposed to the atmosphere, contains in solution the three gases in quite different proportions from those in the air; such water will ordinarily contain most carbonic acid, oxygen in the next largest proportion, and nitrogen in the least, because nitrogen is much less soluble in water than the other gases. When carbonic acid gas is increased in the air to an amount not exceeding 5 to 6 per cent., it is, according to Berzelius, still probably harmless. Man may even live for a time in an atmosphere containing 80 per cent. of carbonic acid. But if carbonic oxide, which is the product of imperfect combustion of carbon and contains only half the amount of oxygen of the carbonic acid, be present even to the amount of only 1 per cent., it may prove fatal. Carbonic acid is the product of perfect combustion of carbon, and of the breathing of animals. In breathing, the oxygen in part unites with carbon in the system, and the air expired contains $4\frac{1}{2}$ per

cent. of carbonic acid gas. This is immediately dispersed through the atmosphere by the property of diffusibility, possessed in such a remarkable degree by the gases; but if confined in close places, it soon accumulates, contaminates the air, and makes it unfit for breathing. Man requires from 212 to 353 cubic feet of pure air per hour, containing 50 cubic feet or about four pounds of oxygen.—Growing plants are the compensating agents, which, besides generating ozone, counteract the noxious influences of combustion and the breathing of animals. Plants as well as animals breathe the air, but the effect of this respiration is just the reverse of that of animals. The carbonic acid gas is decomposed in the laboratory of their leaves, the solid carbon is added to their structure, and the pure oxygen is expired. This action takes place only by the influence of daylight, while in the dark the plants give some of the carbonic acid back to the atmosphere; therefore plants should not be kept in sleeping apartments. Oxygen is thus the life-sustaining element of the air for animals, and carbonic acid for plants, while the chief function of nitrogen appears to be for dilution; but undoubtedly it is also the source of the nitrogen in some plants and consequently in animals.—Water, in the form of vapor, has already been noticed as one of the constituents of the atmosphere. It manifests its presence by condensing in visible moisture and drops upon cold surfaces. When the air is warm, its capacity of holding water is great; as it becomes cool, this capacity diminishes, and the water that is now in excess appears as dew, or mist, or rain. The atmosphere is said to be dry when it has not so much moisture in it as it is capable of holding at its temperature; evaporation then takes place. But let the temperature fall, and the same air will be damp without the absolute quantity of vapor having changed. The degree of heat at which air is saturated with the water it contains is called the dew point. If it is high, the absolute quantity of vapor in the air is great; if low, there is little vapor in it.

ATMOSPHERIC ENGINE. Under this name was formerly understood an engine operated by the simultaneous pressure of cold air on a small piston and hot air on a large piston, the air being heated and expanded during its passage from the small cylinder into the large one. Since, however, engines have been built to work by the pressure of the air alone, without the addition of heat, engines operated by the latter force have been called *caloric engines*. (See CALORIC ENGINE.) The use of ordinary atmospheric pressure as a primary source of power has long been a delusion of persons of the class who still seek for perpetual motion. All that has been accomplished in this way has been by making use of the continual changes in the atmospheric pressure, as for instance to move the mercurial column in a syphon barometer of which the two vertical tubes were very far apart, and the whole balanced on a central

pivot. An increase in atmospheric pressure would drive more mercury into the long closed end, and cause this to descend; a decrease in atmospheric pressure would cause the mercury to return to the short open end, and cause this in its turn to descend; while wheelwork was so arranged as to produce motion by a descent either way. Such a contrivance, however, or any other based on the same principle of the changes in atmospheric pressure, even when constructed on the largest practicable scale, can only produce a weak power. It is evident that in order to produce an available motive power by the application of atmospheric pressure, this pressure ought to be made as strong as steam pressure; for which purpose the air must be compressed by mechanical means, or at least a vacuum created. In this way, however, the air can only be employed for the transmission of power, and this is actually the case in all atmospheric engines. None of them are prime movers, but the air which drives them is compressed by another power—either steam, falling water, or animal force. There are several ways of using this compressed air. One is to fill with it a large strong cylinder, the equivalent of a locomotive boiler, and use this compressed air to work the piston, in the same way as steam is used. This is only applicable upon cars traversing short distances, so that the engine can periodically receive new supplies. It is argued that a very large steam engine, creating the power for a great number of small engines, by compressing air in large reservoirs, to supply all the engines of a city line of railroad cars, is very economical in comparison with several scores of small independent motors, each with its furnace and boiler. Another method of supplying atmospheric pressure from one prime motor to different small engines, is to conduct the air in tubes from the former to the latter. This was successfully employed by Sommeiller in the construction of the Mont Cenis tunnel; the hydraulic power of a cataract near the entrance of the tunnel being used as a prime motor to compress the air in reservoirs, whence it was conducted by flexible tubes to the rock-boring machines. This method is now extensively in use in the United States, the prime motor being ordinarily steam power. One of the chief advantages of atmospheric engines of this class is that, in place of heat and steam escaping, as is the case with steam engines, pure atmospheric air escapes, which by its expansion becomes cold, and thus supplies the end of the mining shaft with pure and cool air, securing a most perfect ventilation; while the use of steam in such a locality, even if a provision were made to carry off the escaping steam, would raise the temperature to such a degree as to make further work impossible. It is now acknowledged that the boring of such tunnels as the Mont Cenis, the St. Gothard, and the Hoosac would be impracticable but for drills worked by atmospheric engines. When

the boring is performed by percussion of steel drills, the atmospheric pressure moves a piston connected with them. When the boring is performed by rotation, as is the case with the diamond drill, the atmospheric engine may be either a rotary or a reciprocating one. In fact the arrangement of all atmospheric engines is nearly identical with that of non-condensing steam engines. As atmospheric pressure may be easily transmitted through tubes in any direction, and therefore also the power of a prime motor, it is expected that in the course of time the power of large cataracts will be utilized in this way to drive atmospheric engines for several miles around. A piston may also be propelled through a very long tube by atmospheric pressure or by a vacuum; this has been applied to transmitting small packages, and also to the propulsion of railroad trains. (See PNEUMATIC DESPATCH, and PNEUMATIC RAILWAY.)

ATNAHS, or *Atnahs*, an Indian tribe of British America, called also Shoushwap or Chin Indians. They are a Selish tribe on Frazer and Salmon rivers, an energetic, industrious people, manufacturing blankets of good quality from the wool of a native goat or sheep.—Another tribe called *Atnas* is mentioned in the early accounts of the northwest as living on Copper river, Alaska, and seems to be now included in the Koloshians.

ATOLL, the Malay name of a peculiar form of coralline island common in Polynesia and the Indian ocean, which consists of a circular reef, seldom more than a few hundred yards wide, enclosing a sheet of water connected with the ocean by an open passage. These lagoons are sometimes 30 m. in diameter and from 100 to 400 feet deep, and afford safe harbors, the opening never being on the windward side. The reefs generally support vegetation, and are sometimes inhabited.

ATOMIC THEORY, the doctrine that matter consists of ultimate particles or atoms incapable of division. This idea was first maintained speculatively in opposition to the notion that matter is capable of being divided to infinity. Modern science has adopted this idea, not merely as a speculation which cannot be verified, but as a proposition which interprets and harmonizes a wide range of experimental facts. Inasmuch as it offers an explanation of the facts and principles of chemistry, these require to be noticed before we can understand the use and necessity of the theory. Modern chemistry took its rise with the abandonment of the old notion of phlogiston, and the elucidation of the principles of combustion by Lavoisier. He introduced the balance as a fundamental instrument of chemical inquiry, and thus placed the science upon a firm quantitative basis. As weighing became general and accurate, it was soon discovered that chemical combination is definite, and chemical composition constant. A certain weight of alkali, for example, combines with a given weight of acid

to produce a salt, which therefore has a fixed numerical constitution. A great number of experiments showed that chemical union always takes place in this manner, and thus was established the fundamental law of definite proportions. It was next discovered that combination may take place between the same substances in different proportions, and that when this is the case these proportions have simple numerical relations to each other. Thus, if two elements A and B are capable of uniting in several proportions, they may be represented as $A + B$, $A + 2B$, $A + 3B$, $A + 4B$, &c. The relations are not always so simple as this, but the principle is general, and is known as the law of multiple proportions. Again, it was found that if two elements which combine with each other combine also with a third, the proportions in the first combination are preserved also in the second. If a body A unites with certain other bodies B, C, D, then the quantities B, C, D, which combine with A, or certain simple multiples of them, represent for the most part the proportions in which they can unite among themselves. This is known as the law of equivalent proportions or chemical equivalence. It having thus been found that chemical actions follow strict numerical methods, and that each body has its fixed measure, it became important to determine exactly what these measures are. This resulted in the scale of combining numbers or equivalents, or, as they are now more commonly termed, atomic weights, which constitute the foundation of the science and are given in all text books.—But if all kinds of matter in their chemical transformations are ruled by these numerical principles, we should expect that other material properties would be affected by them, and such is the fact. The combining weights of those elements which are known to exist in the state of gas or vapor are, with one or two exceptions, proportional to their specific gravities in the same state. Thus, the specific gravity of hydrogen being 1, that of oxygen is 16, sulphur vapor 82, chlorine 85.5, iodine vapor 127; but the figures represent also the combining numbers of these elements. Mr. Watts thus expresses the law of combination by volume: "If the smallest volume of a gaseous element that can enter into combination be called the combining volume of that element, the law of combination may be expressed as follows: The combining volumes of all elementary gases are equal, excepting those of phosphorus and arsenic, which are only half those of the other elements in the gaseous state; and those of mercury and cadmium, which are double those of the other elements." Gay-Lussac showed that combinations by volume take place in definite and multiple proportions, and that the volume of a compound gas always bears a simple ratio to the volumes of its elements, thus:

1 vol. hydrogen	and 1 chlorine	form 2 vols. hydrochloric acid.
2 vols. "	" 1 oxygen	" 2 " watery vapor.
8 " "	" 1 nitrogen	" 2 " ammonia.

Again, it is found that in many cases two or more compounds which are supposed to contain equal numbers of equivalents of their respective elements crystallize in the same or in very similar forms, and such compounds are said to be isomorphous. Accordingly, these isomorphous relations are often appealed to for the purpose of fixing the constitution of compounds, and thence deducing the atomic weights of their elements, in cases which would otherwise be doubtful. It has also been established that substances having different properties may have the same relative proportion of constituents, and such are said to be isomeric. Moreover, something analogous to this is seen among the elements themselves: they are capable of assuming different states, which capability is called allotropism. In both cases we are compelled to assume that their constituent parts are subject to differences of arrangement. Combining quantities are also intimately related to heat. This relation is thus stated by Mr. Watts: "The atomic weights of the elements, determined according to their modes of combination, are for the most part inversely proportional to their specific heats; so that the product of the specific heat into the atomic weight is a constant quantity. The same quantity of heat is required to produce a given change of temperature in 7 grains of lithium, 56 of iron, 207 of lead, 108 of silver, 196.7 of gold." Finally, the law of combining proportions is implicated with the electrical relations of matter. Prof. Faraday proved that an equivalent of an element consumed in a battery gives rise to a definite quantity of electricity, which will produce exactly an equivalent of chemical decomposition. For example, the consumption of 32 grains of zinc in a battery excites a current which will set free from combination 1 grain of hydrogen, 108 of silver, and 89 of potassium; these being the combining numbers of the respective elements.—The facts above stated are independent of all hypothesis, and are the results of pure experiment. They demonstrate that in its ultimate and minutest form matter is in some way numerically constituted. How it is constituted was a question which the human mind could not escape. It was necessary to frame some clear conception of its ultimate constitution that would connect and interpret the known facts. This was done by Dr. John Dalton of Manchester, England, in constructing the atomic theory. He was aware of the law of definite proportions, and he discovered the law of multiple proportions by investigation of the compounds of carbon and hydrogen, of oxygen and carbon, and of nitrogen and oxygen. To account for these laws, he assumed, first, that all matter consists of indivisible, unchangeable atoms of extreme minuteness; second, that all the atoms of the same element have the same weight, but that in different elements they have different weights; third, that these relative weights correspond with the combining numbers,

which may therefore be called atomic weights; fourth, that these different atoms have mutual attractions and combine to form chemical compounds, not by interpenetration of their substance, but by atomic juxtaposition. If this idea be admitted, the principles of chemical constancy and definite proportions follow as inevitable consequences. The definite proportions in which bodies combine represent the constant ratio between the weights of the combining atoms. The principle of multiple proportions is equally explained, for the successive additions must be made by whole atoms, and therefore by whole numbers. One atom of carbon unites with one atom of oxygen to form carbon monoxide, and with two atoms of oxygen to form carbon dioxide. That the atomic weights of compounds must equal the sum of the atomic weights of their elements follows with equal certainty. Moreover, in the rearrangement of atoms in a body, without addition or subtraction of elements, we have a ready explanation of isomeric and allotropic changes. The relations of chemical changes to heat, now expressed by the phrase "atomic heat," and their relation to volume, indicated by the phrase "atomic volume," become in like manner capable of explanation on the assumptions of the atomic theory. It is a merit and a test of this theory that its resources have kept pace with the rapid extension of the science, but it has required to be itself developed for this purpose. In the hands of Dalton it was applied to a few simple fundamental facts; it now embraces facts of many orders and of greater complication. At present the conception of the molecule or the group of combined atoms plays a much more important part than it did at first. Even the atoms of the elements (as will be presently explained) are now conceived not to exist separately, or as units, but as combined with each other in a molecular condition. An atom is defined as the smallest particle of simple matter that can enter into the composition of a molecule. A molecule is defined as a group of atoms held together by chemical force, and is the smallest particle of any substance that can exist in a free or uncombined state in nature. Molecules are of two kinds: elemental molecules, in which the atoms are alike, and compound molecules, in which the atoms are unlike. Molecular structure, the outgrowth of the conception of atoms, is now the fundamental idea by which chemistry and physics are connected.—The doctrine of Dalton at first seemed to afford an easy explanation of chemical equivalents, by which one body may replace another, or be substituted for it by simple exchange of atoms. But recent discoveries have shown that it fails here and requires extension. It was formerly supposed that when one element replaces another in a combination, the substitution always takes place atom for atom, and hence the terms atom and equivalent were regarded as synonymous.

But it is now known that this is only true for certain elements, which are accordingly classed as monogenic elements. There are others which always take the place of two or more atoms of a monogenic element, and these are termed polygenic elements. This brings us to the new conception of atomicity, which has now become the fundamental idea of the science. To understand it properly, it will be necessary to glance at the steps of chemical theory by which it has been reached. The name of Lavoisier is intimately associated with the first general theory of chemical combination. This was the binary or dual system of chemistry. An acid was held to result from the union of a simple body (generally non-metallic) with oxygen; an oxide resulted from the combination of oxygen with a metal; a salt was produced by the union of an acid with an oxide, and this pairing of doubles represents its constitution. In all combinations affinity is assumed to be exerted upon two elements, simple or compound, which attract one another and unite by virtue of opposite properties, all chemical compounds being therefore binary. This is dualism, and the chemical nomenclature was constructed upon the idea. The view proposed by Lavoisier was ably enforced by Berzelius. Electro-chemistry, by which bodies were decomposed into pairs that appeared at opposite poles of the battery, lent powerful aid to the binary theory; and Berzelius carried it out by arranging the elements on a scale of antithesis as electro-positive and electro-negative. In 1816 he also devised a new notation, now in general use, by which letters symbolize the elements, and composition can be compendiously represented to the eye by means of formulas. Prof. Wurtz, in his "History of Chemical Theory," says: "By the arrangement of these formulas in which the acid appeared on one side with the train of oxygen atoms belonging to it, and the metallic base on the other with the oxygen united to the metal, Berzelius gave to the dualistic system a degree of precision unknown before his time." But a true scientific theory must embrace all orders of facts to which it is applicable. Dualism was well fortified in mineral chemistry, but it was not easy to bring the complexities of organic chemistry into harmony with it. Berzelius, however, made this his great task. There were organic acids, organic bases, and organic salts; and these were represented on the binary plan. Organic radicals were also discovered—compounds which played the part of simple elements; and these were subordinated to the binary system. By this theory of compound radicals dualism was extended to organic chemistry, and chemical theory was apparently unified. Yet the victory was far from complete. The deeper study of organic compounds led eminent chemists to question the validity of the dual hypothesis as applied to them. A school arose led by Dumas, Laurent, and Gerhardt, which took a new view of the constitu-

tion of organic bodies. Its first idea was the doctrine of substitutions, and in its application a breach was made at the outset in the electrochemical theory. It was found that chlorine, a powerful electro-negative element, could replace hydrogen, a strong electro-positive element, in an organic compound, playing the same part and not altering the character of the compound. The new view, rejecting dualism, regarded organic bodies as units, or as unitary structures; and their changes by substitution were likened to the alteration of an edifice by successively removing its individual bricks and stones and replacing them by others. Laurent compared organic compounds to crystals, whose angles and edges may be replaced by new atoms or groups of atoms, while the typical form is preserved. Thus to the dualistic point of view was opposed the unitary system; to the idea of combination resulting from addition of elements was opposed that of compounds formed by substitution of elements. An acid is changed to a salt by substituting a metal for its hydrogen, without destroying its molecular structure. A salt is no longer to be regarded as a binary compound, containing an acid on the one side and an oxide on the other; it is a whole, a single group of atoms, among which are one or more atoms of metal capable of being exchanged for other metallic atoms or for hydrogen. This view led to the theory of chemical types, in which certain substances are taken as patterns of molecular structure with which analogous bodies are classified. Thus we have the water type, the hydrogen type, and the ammonia type, under which bodies are grouped with no reference to their former relationships. The binary theory here disappears, and substances are brought together not so much on the principle of composition or atomic arrangement, as by analogies of reaction and decomposition.—But the doctrine of types was transitional, and soon developed into the completer theory of atomicity, by which is meant combining capacity. For example, there are some acids which require for saturation only one equivalent of a certain base; there are others which require two equivalents of the same base to saturate them; and others still which demand three. Now these acids are clearly not equivalents of each other, their capacities of combination varying as 1, 2, 3; and they are therefore said to have different atomicities. This conception of the varying combining powers of bodies, as a controlling chemical principle, was worked out in the field of organic chemistry; but it is now extended to the inorganic elements, and offers a new system of classification and a new chemical method.—In the new chemistry the elements are arranged into six groups, although some add a seventh. These are named monads, dyads, triads, tetrads, pentads, and hexads—terms expressive of their several combining capacities. Monads, of which hydrogen, chlorine, and potassium are examples, are

monogenic, that is, they can combine only with single atoms. All the rest are polygenic, that is, they can combine with 2, 3, 4, 5, or 6 monogenic elements or their equivalents. Molecules are also designated as monatomic, diatomic, triatomic, tetraatomic, pentatomic, and hexatomic. For equivalence, which represented the old idea, the term valence is coming into use; and a series of words is derived from it describing the groups as univalent, bivalent, trivalent, quadrivalent, quinquivalent, and sexivalent, while the atomicities above univalence are termed multivalent. The varying equivalence, valence, or combining power of atoms is represented in several ways by which the idea is made clear. The graphic symbol of an atom is a circle with lines radiating from it, called bonds, which indicate the valence or atomicity. They are represented as follows, the first line giving their names, the second their symbols, and the third examples:

Monad. Dyad. Triad. Tetrad. Pentad. Hexad.

Hydrogen. Oxygen. Boron. Carbon. Nitrogen. Sulphur.

Water, OH_2 , would be thus represented by

graphic formula: $\text{H}-\text{O}-\text{H}$. Hydrogen

has as it were but a single pole of attraction, represented by a single bond, while oxygen has two poles and two bonds. The attractions of the two atoms of monatomic hydrogen are satisfied by the two attractions of diatomic oxygen. So carbon-dioxide, CO_2 , may be represented thus: $\text{O}-\text{C}-\text{O}$. Here the

four attractions of tetratomic carbon are saturated by those of the two atoms of diatomic oxygen. Marsh gas, CH_4 , is thus represented:

The circle may be omitted, and the bonds connected directly with the letters, thus,

$-\text{H}$, $-\text{O}-$, $-\text{C}-$, it being

immaterial how the bonds are arranged. The composition of water will then be represented thus, $\text{H}-\text{O}-\text{H}$, and carbon-dioxide $\text{O}=\text{C}=\text{O}$.

The atomicity is often represented as follows by dashes: H' , O'' , B''' , C'''' , N''''' , S'''''' ; or again thus by Roman numerals: H^I , O^{II} , B^{III} , C^{IV} , N^V , S^VI . In chemical changes and the formation of new compounds all attractions require to be satisfied—every bond engaged. This fact fixes a limit to combination, for certain groupings become impossible. One atom of a monad cannot unite with one atom of a dyad, because one attraction cannot neutralize two. It takes two atoms of a monad to form a compound with an atom of a dyad; four atoms of a monad or two atoms of a dyad are required to saturate a tetrad; but in each case all the polarities have to be provided for.

There are seeming exceptions to this law. Two atoms of a monad element, as potassium, may unite with one, two, three, four, or five atoms of a polyad element, as sulphur. By an examination of the graphic formulas of these compounds, $K-S-K$, $K-S-S-K$, $K-S-S-S-K$, &c., it is seen that any number of atoms of a polyad element may unite with two atoms of a monad, provided they be interposed between the latter. When thus placed, they are said to perform a linking function in the compound. The atomicity of an element is its highest equivalence, and the compound form is then said to be normal or saturated. Yet the equivalence of atoms is not always the same; an atom may form several compounds of the same substance. Elements of even equivalence, in which the atomic poles are in pairs, are called artiad; those of uneven equivalence, in which the poles are odd, are termed perissads. Prof. Barker states that the equivalence "always increases or diminishes by two; so that an atom of the same element may in different compounds have an equivalence of 1, 3, 5, or 7, or of 2, 4, or 6. A perissad atom can never become an artiad atom by such a change, nor can an artiad become a perissad." This variation of atomic equivalence is accounted for on the hypothesis that the bonds of an atom are capable of saturating each other in pairs. A pentad may thus become a triad and a monad successively, and a hexad may be converted into a tetrad or into a dyad, as follows:

It follows from this view that only the atoms of those free elements can be considered as existing separately in which the number of bonds is even. The others can only exist in combination with each other, forming polyatomic molecules. Free hydrogen cannot be $-H$, because its bond is unsatisfied; it must therefore be $H-H$, that is, united with itself, forming what we might call hydride of hydrogen. Chlorine is not $Cl-$, but $Cl-Cl$, and free oxygen is not $-O-$, but $O=O$. Compounds are formed by replacement, and chemical science thus becomes rooted in atomic capacity.—While therefore in the last quarter of a century chemical philosophy has undergone a total revolution, the atomic theory has not only been maintained and strengthened, but it is doubtful if the advance could have been made without its assistance.

ATRATO, a river of Colombia, South America, rises near lat. $5^{\circ} 20' N.$ and lon. $78^{\circ} 50' W.$, and flows nearly due N. for about 250 m. to the gulf of Darien. The bar at its mouth being crossed, it has a wide channel not less than 35 ft. deep for the first 96 m., with a fall not exceeding $2\frac{1}{2}$ inches to the mile; and for 42 m.

further a channel exceeding 18 ft. in depth can be cleared; while the distance across to the Pacific ocean, from which the river is separated by one of the lowest ranges of the Andes, does not exceed 50 m., and western branches of the Atrato are said to almost meet rivers from the Pacific having their source in this dividing ridge. Examinations have been made with the view of determining the practicability of constructing a ship canal by this river, to connect the Caribbean sea with the Pacific. The latest was by the United States government in 1871. The route which promised the least difficulty between the middle branch of the Atrato and the Jurador, emptying into the Pacific, would require 48 m. of canal; the height of the watershed, which must be excavated or tunneled, being more than 500 ft.—The Atrato for nearly its whole length runs through a low swampy region, which is entirely overflowed by freshets. Quibdo, on its upper course, is the only town of any consequence on the river. It is a miserable place of 1,500 inhabitants, mostly blacks, with some Indians and a few whites. It is situated on several isolated hillocks of gravel and clay, in the midst of the swampy region which extends all around. The temperature of the region is close and sultry, and the rainy season continues all the year. Gold is found in fine dust in the bed and banks of the Atrato, at and above Quibdo, and also of the different branches of the river. Some portions of the country are described as highly auriferous. Above Quibdo the Atrato receives several branches, of which the Quito is the most important. Were it not for the incessant fluctuations of this stream, which within a few hours frequently reduce it from its ordinary ample channel depth of 7 ft. or more to 5 or 6 ft. or even less, the Quito would present with the Atrato an uninterrupted steamboat thoroughfare of no less than 252 m. from the gulf of Darien. The Quito is wholly in the gold region, and its branches appear to lie in the richest portion of it. The caoutchouc tree abounds.

ATREBATES, or *Atrebatii*, a people of Belgic Gaul, whose name appears in the modern Artois. They joined a confederation against Cæsar, and furnished a contingent of 15,000 troops. A colony of them settled in Britain, in the modern Berkshire and Wiltshire.

ATREUS, a legendary hero of Greece, son of Pelops and Hippodamia. On the death of his son Pliethenes, Atreus married his widow Aërope, who was or became the mother of Agamemnon and Menelaus, commonly known as the Atreidæ. She was seduced by Thyestes, the brother of Atreus, and the latter slew the twin offspring of this adultery and served them at a banquet to the seducer. Atreus afterward married his brother's daughter Pelopia, who was already pregnant with Ægisthus by her own father. The child was exposed, but miraculously preserved, and the mother committed suicide. The crimes and misfortunes of the family, springing from the

murder of Mercury's son Myrtilus by Pelops, afforded endless themes for the classic poets.

ATRIUM. I. In Roman architecture, the central room of the house, also called *caelum ædium*. In this room the family lived and ate, and here stood the *lares* and *penates*. The room was uncovered in the centre, toward which the roof sloped, to throw the rain water into a cistern in the floor, around which stood the household deities. II. The forecourt of a temple. The atrium of the temple of Liberty is most frequently mentioned. III. In ecclesiastical architecture, an open space before a church, making part of the narthex, or antetemple. Penitents and others stood in the atrium to solicit the prayers of the pious.

ATROPATENE. See AZERBAIJAN.

ATROPHY (Gr. *ἀτροφία*, hunger, from *ἀ* privative and *τροφή*, nourishment), in medicine, the wasting away of any organ or portion of the body from want of nutrition in the part, irrespective of the general nutrition of the body. The principle of vitality decreases in the organ when its functions are suspended, and nutrition slackens where the vital principle becomes inert. The mammary glands or milk-secreting organs, in the breasts of women who have passed the age of child-bearing, are sometimes so much atrophied that traces of them only can be found imbedded in large lobes of adipose tissue or fat. In contrast with atrophy is hypertrophy, or excessive nutrition and enlargement of an organ or set of organs in the body. Any limb or portion of a limb artificially compressed for a long time will be depressed in its vitality, and lack the power to appropriate nutrition from the blood; it will gradually diminish in size and force, and become atrophied. Disuse alone, without compression, will cause atrophy in the upper or the lower limbs, or even in the whole body; for many persons waste away from morbid inactivity, which brings on by degrees emaciation and debility, resulting in decay of the whole system. —Paralysis, by preventing natural exercise in the limbs, may depress the vitality of the parts, and diminish their powers of nutrition. This will cause atrophy, or a falling away of the paralyzed limb. The dislocation of a joint, if neglected, may, by causing pressure on the nerves, cut off a portion of the innervation necessary to maintain the active functions of nutrition in the parts below, and thus depress vitality and bring on atrophy. In children of a scrofulous diathesis, disease in the hip joint often affects the nerves of the parts and the vitality of the whole limb, diminishing the powers of nutrition, and causing the leg to dwindle in comparison with the one which is not affected. In these cases the atrophy is of a double nature; for the gluteal muscles waste away, and the bones decay in part, before the limb begins to dwindle in its general proportions from the weakened powers of nutrition.

ATROPIA, or *Atropine* (Gr. *Ἀτροπῆς*, one of the Fates), a vegetable alkaloid of highly poi-

sonous properties, extracted from the *atropa belladonna*, or deadly nightshade. It is obtained from the juice expressed from all parts of the plant, but more particularly from the leaves. It crystallizes in white silky prisms, which have a bitter taste, but no smell. They possess an alkaline reaction, reddening litmus paper; they melt at 194° F., and are volatilized at 284°. Their composition is: carbon, 70.98; oxygen, 16.36; hydrogen, 7.83; and nitrogen, 4.83. Atropia forms crystallizable salts with acids, the sulphate being considerably used in medicine. When in solution it gives a lemon-yellow precipitate with terchloride of gold. It was first obtained by Mein, a German apothecary, by digesting the roots, powdered extremely fine, for several days in alcohol, and afterward separating the other ingredients by various precipitations. From 12 ounces of the root he obtained 20 grains of pure alkali. Chloroform and potassa are also used for obtaining its solution. (See BELLADONNA.)

ATROPOS, one of the Fates (*Μοῖρα*, Lat. *Parca*) of Greek mythology, who cut the thread of life. She is represented with a pair of scales, or a sun dial, or a cutting instrument.

ATTACHMENT (Fr. *attacher*, to seize), in law, the seizure of the person or property. The writ of attachment is of two kinds: 1. Against the person, in the nature of a criminal proceeding for contempt of court. It may be issued against attorneys, solicitors, sheriffs, and other officers of court, for any misconduct or neglect of duty. The object of the attachment is in such cases to bring the offending party personally into court, to answer for the alleged contempt, and unless he can clear himself he is punishable by fine or imprisonment. Jurisdiction has formerly been exercised by courts over a very large class of cases, and no precise limit has been fixed to the power. The statute of New York continues the jurisdiction to the same extent that has been heretofore used. In the famous case of *Yates* in New York, in 1810, who was committed to prison by the chancellor for misconduct as a master, the question was agitated but not definitively settled whether there was any relief upon habeas corpus from such imprisonment. (*People v. Yates*, 4 Johnson's Rep. 317, 6 id. 337.) 2. A writ as to contempt to enforce the civil remedies of parties to suits, or to protect the rights of such parties. In the English chancery this was the only process for enforcing its orders and decrees. In this country it has been resorted to by all the courts to enforce interlocutory orders. It is, however, no longer used in New York for the collection of costs or any money demand, except against attorneys, solicitors, and other officers of court. (Act of 1847.)—Attachment against property was an old mode of proceeding in English practice to compel the appearance of a defendant in an action. To this head belongs also the proceeding known as foreign attachment, a process under which the prop-

erty of a foreign or absent debtor is seized. The proceeding had its origin in a custom of the city of London, of which we find some notice in the books as early as the reign of Edward IV. By this custom, an action having been brought in the mayor's court against A, and the writ having been returned *nil* (that is to say, that nothing could be found as a distress to compel appearance of defendant), and thereupon it being suggested by the plaintiff that another person residing in London is indebted to A, a writ is issued to warn such debtor, who is thereafter in the proceedings called "garnishee;" and if he does not deny that he is indebted, the debt is by virtue of such writ attached in his hands to answer the judgment which shall be recovered against A. Cowell defines a foreign attachment to be "an attachment of foreign goods found within a liberty or city in the hands of a third person for the satisfaction of some citizen to whom the said foreigner oweth money." But there is no trace of such proceeding in any other place in England than London. This proceeding has been introduced into our eastern states and some others, and is a common mode of collecting a debt due by a non-resident who has property within the state, such property, whether lands, chattels, or debts due to him, being seized at the commencement of the action to satisfy the judgment which shall be recovered. It is sometimes called trustee process, the person who is indebted or holds property of the non-resident defendant being designated as trustee. In New York an attachment may by the code issue against the property of a non-resident defendant who cannot be served with process, but the proceeding is more simple than the trustee process of the eastern states. There is also a distinct proceeding for the attachment of property of absconding, concealed, absent, or non-resident debtors, which is not an action but a sort of insolvent proceeding for the benefit of all the creditors of the person whose property is attached.

ATTAINER (Fr. *teindre*, Lat. *tingere*, to stain), in old English law, the extinction of civil rights, and the forfeiture of estate which followed, when a person was condemned to death for treason or felony, or where judgment of outlawry had been pronounced against him for not appearing to answer to a capital crime. It might also take place by act of parliament, called bill of attainder. In the case of high treason the effect was forfeiture of real and personal estate, and corruption of blood, so as to interrupt hereditary descent of any civil right. For capital crimes less than high treason, there was a forfeiture of personal property absolutely, and of the profits of freehold estates during life; and after the death of the criminal all his lands in fee went to the crown for a year and a day. The corruption of blood caused also an escheat of lands. But in its operation escheat was subordinate to forfeiture. In high treason the forfeiture intervened to defeat the

escheat altogether, and in the lesser offences it interrupted it for the sovereign's year and day. But the escheat did not take place merely in respect to the lands held by the offender. Thus if a father was seized in fee, and his son committed treason and was attainted, and then the father died, the father's lands even in that case escheated, because at his death the son was incapable of inheriting them, and the son's heirs could not take them because they could only deduce their title through the son. But there was no forfeiture in such a case, because the criminal never had the lands. This corruption of blood and its consequences could not be remedied save by act of parliament. By statute 7 Anne, ch. 21 (the operation of which was suspended at first during the life of the pretender, and afterward during the lives of his sons, but which suspension was repealed by 39 George III., ch. 93), it was enacted that no attainder for treason should extend to the disinheriting of any heir, or to the prejudice of any person other than the traitor himself. By the statute 54 George III., ch. 145, it was provided that no attainder for a felony, except treason or murder, should extend to the disinheriting of any person, nor to the prejudice of the right or title of any person other than the offender himself, during his natural life only; and any person who might otherwise inherit, might on his death claim his land. There have been several subsequent enactments of a similar tendency.—A bill of attainder was a legislative conviction for alleged crimes with judgment of death. The great act of attainder passed in 1688 by the parliament of James II., by which more than 2,000 persons were attainted and their property confiscated, is one of the most noteworthy illustrations of this sort of legislative convictions. Other acts of the same character were those relating to the earl of Strafford in 1641, to Sir John Fenwick in 1696, to Lord Clarendon in 1699, and to Bishop Atterbury in 1728. The so-called bills of pains and penalties were of the same character, though of a milder form, inflicting punishment less than that of death.—Not only probably on account of the mere injustice of all legislative acts of this character, but as well in the fear that the power to inflict such punishments intrusted to the legislature of a democratic state might lead to unusual excesses and abuse in times of political excitement, the founders of our government by a distinct constitutional provision prohibited the enactment of any such laws here. The constitution of the United States declares that no bill of attainder shall be passed either by congress or by any state. But as it still remained competent for the judiciary to convict of treason or to declare attainers, the constitution, still further to guard against this odious form of enactments, also provided (art. 3, sec. 3) that congress should have power to declare the punishment of treason, but that no attainder of treason should work complete corruption of blood or forfeiture ex-

cept during the life of the person attainted. In the cases familiarly known as the test oath cases, *Cummings v. Missouri*, and *ex parte Garland*, reported in 4th Wallace, U. S. Supreme Court Reports, pp. 277 to 399, where all these constitutional provisions were very fully discussed, it was held by the court that within the meaning of the constitution bills of pains and penalties are included in the prohibition of bills of attainder. The former case involved the oath of loyalty prescribed by the constitution of Missouri adopted in 1865. Under the several sections of the second article of that instrument priests and clergymen (and the plaintiff fell within this description) were required, in order that they might continue to exercise their functions as such, to take this oath of loyalty, which was to the effect that they had not committed certain designated acts of disloyalty to the United States, some of them being at the time of their commission offences involving penalties, and others innocent in themselves; and it was held that these provisions constituted a bill of attainder within the meaning of the federal constitution. The case of *Garland* involved an act of congress of Jan. 24, 1865, which provided that after its passage no person should be admitted as a counsellor to the bar of the supreme court, and after March 4, 1865, to the bar of any circuit or district court of the United States, unless he should first have taken the oath required by the act of July 2, 1862. This oath was much like that in *Cummings's* case, and was to the effect generally that the affiant had never been guilty of any disloyalty to the United States; and it was held that exclusion from the practice of the law in the federal courts for past misconduct was punishment for such conduct; that the exaction of the oath was the means provided for ascertaining the persons on whom the act was intended to operate; and that for these reasons the act partook of the nature of a bill of pains and penalties, and was within the constitutional inhibition of bills of attainder. The court in both these cases consisted of nine judges, and in each four of the judges, including the chief justice, dissented; and the prevailing opinion of the court has not commanded the concurrence of some of our ablest jurists.

ATTAKAPAS, a large and fertile section of southwestern Louisiana, including several parishes. Though often mentioned in commercial reports, it is not the legal appellation of any subdivision of the state. Great quantities of sugar and molasses are produced in the district and shipped at Franklin, St. Mary's parish.

ATTAKAPAS, an Indian tribe of southern Louisiana, who have left that name to a district of the state. Their real name is not known; they were called *Attakapas* or *Men-Eaters* by the Choctaws. They were first made known to the French by the adventures of Belleisle, who was left on shore by a ship, and was long in their hands. They aided the French against the *Natchez* and *Chickasaws*. In 1803 there

were about 100 dispersed through the *Attakapas* district, chiefly on Bayou Vermilion; but in less than 20 years after that they ceased to be enumerated at all. Their language was peculiar, abounding in harsh monosyllables.

ATTALA, a central county of Mississippi, bounded W. by Big Black river; area, 750 sq. m.; pop. in 1870, 14,776, of whom 5,948 were colored. Its surface is undulating, and the soil in some parts fertile. In 1870 the county produced 9,544 bushels of wheat, 337,402 of Indian corn, 35,150 of sweet potatoes, and 8,912 bales of cotton. Capital, Kosciusko.

ATTALUS. I. A general of Philip of Macedon, and uncle of Cleopatra, whom Philip married, killed about 336 B. C. At the wedding festivities of his niece, he called upon the company in the presence of Philip and Alexander to beg of the gods a legitimate successor to the throne. This Alexander violently resented, and a brawl ensued, in which Philip took the part of his general and drew his sword upon his son. Alexander and his mother Olympias then withdrew from the kingdom. The assassination of Philip by Pausanias was the consequence of an outrage committed by Attalus which Philip refused to punish. Attalus, who was then in Asia, entered into a conspiracy against Alexander, but soon made overtures for submission, which the king disregarded. Hecataeus was sent into Asia with orders either to bring Attalus to Macedonia or assassinate him, and the latter course was adopted. II. **Attalus I.**, king of Pergamus, reigned from 241 to 197 B. C. He was the first ruler of Pergamus who bore the title of king, assuming that dignity after a victory over the Gauls. He made himself master of a large portion of Asia Minor, but was driven back to Pergamus by Seleucus Ceraunus and Achæus. He was afterward an ally of Antiochus the Great against Achæus, and of the Romans and Rhodians against Philip of Macedon. The Macedonians invaded his territory, but failed to capture Pergamus. III. **Attalus II.**, king of Pergamus, surnamed Philadelphus, second son of the preceding, born in 200 B. C., succeeded his brother Eumenes II. in 159, died in 138. He adhered to the Roman alliance, founded Philadelphia in Lydia, and encouraged the arts and sciences. IV. **Attalus III.**, king of Pergamus, surnamed Philometor, son of Eumenes II. and Stratonice, succeeded his uncle Attalus II. in 138 B. C., died in 133. On his accession he murdered many of his relatives and friends. After a short reign of disorder he was seized with remorse and melancholy, withdrew from public affairs, and devoted himself to sculpture and gardening. He bequeathed his kingdom to the Romans. V. **Flavius Priscus Attalus**, emperor of the West in 409-'10. He was born in Ionia, brought up as a pagan, and baptized by an Arian bishop. Being a senator and prefect of Rome at the time of the second siege of the city by Alaric, he was declared emperor by the barbarians in place of Honorius, and sent a message

to Honorius, commanding him to cut off his hands and feet and retire to a desert island. At the end of a year he was deposed by Alaric on the plain of Ariminum. After the death of Alaric he was again put forward by Ataulphus as a claimant of the purple; but he was taken prisoner and sentenced by Honorius to lose a thumb and forefinger and suffer banishment in the island of Lipari.

ATTAMAN, the title of the supreme chief of the Cossacks, now retained only by those of the Don. The attaman was elected by the people in a general public meeting; the mode of election was by throwing their fur caps at the favorite, and he who had the largest heap of caps was chosen. When in the 16th century the Cossacks submitted to the Poles, the election of the attaman was confirmed by the Polish king. After the secession of the Cossacks from Poland and their submission to Russia in the 17th century, the attamans preserved the same rights until after the insurrection of Mazeppa, when the office was suppressed. In 1750 it was restored in the person of Count Razumovsky. When Catharine II. destroyed the organization of the Cossacks of the Ukraine, the dignity of attaman was confined to those of the Don. The last elective attaman of these Cossacks was Platoff, after whose death the emperor Nicholas made the dignity of attaman hereditary in the caesarevitch. The commanders of various other Cossack organizations in Russia bear the title of attaman, but only by custom and courtesy. From the word attaman was derived the word *hetman*, in ancient Poland the title of the commander of all the military forces of the nation.

ATTAR or *Otto of Roses*, a delicious perfume extracted from the petals of the rose. It is a volatile oil, of soft consistency, nearly colorless, and deposits a crystallizable substance partially soluble in alcohol. The best is prepared at Ghazipoor in Hindostan; but it is apt to be much adulterated with sandalwood and other oils. It is obtained from rose water by setting it out during the night in large open vessels, and early in the morning skimming off the essential oil, which floats at the top. It is estimated that 200,000 well grown roses are required to produce half an ounce of the oil; and the value of this when it is manufactured is about \$40. If warranted genuine at the English warehouses, it sells for about \$50, or \$100 per ounce.

ATTERBOM, Peter Daniel Amadeus, a Swedish poet, born Jan. 19, 1790, died in Upsal, July 21, 1855. At the university of Upsal he was one of several students who formed the "Aurora" association, with the purpose of emancipating Swedish literature from French influence. His essays published in the society's magazine, the "Phosphorus," and directed against the academy and the prominent literary party of the day, provoked a feud in which he was the chief object of attack. But he gradually gained adherents, and in 1819, after a tour

of two years in Germany and Italy, he was made German tutor to Prince Oscar, the future king of Sweden. Subsequently he became professor at Upsal, and in 1839 was received as member of the academy, which he had assailed in the "Phosphorus." The best of his satirical contributions to that magazine was a drama in prose entitled *Rimarbandet*, "League of the Rhymers." As founder and for many years editor of the *Poetisk Kalender*, he exerted a marked influence upon æsthetic culture in Sweden. His lyrical poems are contained in his *Samlade Dikter* (2 vols., Upsal, 1836-'7). His *Skrifter* or confessions (1835) treat of history and philosophy. The most important of his other works, *Seenska Siare och Skalder* ("The Seers and Poets of Sweden"), is a review of Swedish literature. The 6th and last volume of this work appeared in 1856. A posthumous work, *Poetiska Historia*, was published at Örebro in 1862. The best complete edition of his works appeared there in 1858.

ATTERBURY, Francis, an English theologian and politician, born at Milton, near Newport-Pagnell, Buckinghamshire, March 6, 1662, died in Paris, Feb. 15, 1732. He was the son of a clergyman, and was educated at Westminster school, and at Christ Church college, Oxford, where he took his bachelor's degree in 1684. In 1687 appeared his controversial work, "A Reply to 'Considerations on the Spirit of Martin Luther and the Original of the Reformation,'" a pamphlet written by Obadiah Walker, a Roman Catholic, master of University college. Atterbury's defence of Protestantism was long classed among the best of such arguments. He now acted for several years as tutor to young Boyle, afterward earl of Orrery. Taking orders in 1691, his eloquence as a preacher procured him several offices in the church, and finally the appointment of chaplain to the king and queen. He was constantly involved in controversies on theological and literary subjects. He acquired special notoriety from a work written principally by him, but published in 1698 under the name of Charles Boyle, who was then a student at Christ Church, in which great wit but little learning was used in a violent attack upon Richard Bentley, who had declared the reputed letters of Phalaris, previously published by Boyle, to be entirely spurious. This was one of the most famous literary controversies of the time, and before it closed it had enlisted much of the talent of the two universities on one side or the other. In 1700 Atterbury engaged on the side of the clergy in a discussion of the rights of convocation, and received the thanks of the lower house of convocation, and the degree of D. D. from Oxford. In 1702 he was appointed a chaplain in ordinary to Queen Anne, in 1704 dean of Carlisle, and in 1707 canon in Exeter cathedral. During several years he engaged in an intricate theological dispute with Benjamin Hoadley. In 1710 he was made prolocutor to the lower house of convocation, in 1712 dean of Christ Church

(but removed on account of his quarrelsome temper), and in 1713, on the recommendation of Lord Oxford, bishop of Rochester. It has been asserted, though never proved, that on the death of Queen Anne Atterbury proposed an immediate attempt in favor of the pretender, James; at all events he soon showed himself on the side of the Stuarts, and vigorously opposed the measures of the government. He was finally convicted of participation in a treasonable plot for the forcible restoration of the fallen dynasty, and after making an eloquent defence before the lords, he was sentenced in May, 1723, to expulsion from all his offices and to perpetual exile. In June he left England for France, with his daughter Mrs. Morrice, and resided in Paris during the remainder of his life. For several years of his exile he continued to work secretly in the interest of James; but he lost favor with that prince on account of certain differences of opinion, and, though afterward reconciled to him, he was never his active partisan after 1727, when he wrote to him a letter of withdrawal. He was buried in Westminster abbey, though without public ceremony; and the government afterward caused his coffin to be opened, in search for treasonable papers supposed to be hidden in it.

ATTICA (Gr. Ἀττική, probably a corruption of Ἀκτική, from ἀκτή, shore or coast), one of the political divisions of ancient Greece, occupying a triangular peninsula, bounded N. by Boeotia, E. by the Ægean sea, S. W. and W. by the Saronic gulf and Megaris; area, about 840 sq. m. It is intersected by several mountain ranges, having their centre and highest point in the great group called by the ancient Greeks Cithæron (the modern Elatea, the mountain of firs), which rises at the N. W. extremity of the country, and a little E. of the Corinthian gulf, to the height of 4,630 feet. From this extend to the eastward the Parnes mountains, forming part of the boundary and an almost impassable barrier between Attica and Boeotia; and to the southward several smaller ranges, the westernmost separating Attica from Megaris, while the others divide the country into districts anciently known by the following names (mentioned in their order from west to east): the Eleusinian plain, N. E. of the bay of Eleusis; the Athenian plain, having its centre near Athens; the Mesogæa or midland district, an undulating plain, enclosed by Mt. Hymettus, Mt. Pentelicus, the sea, and a range of hills running across Attica from the promontory of Zoster; the Paralia or coast district, including all the southern part of the peninsula, below the promontory of Zoster on the W. and Brauron on the E.; and finally, the Diacria or highlands, bounded by the Parnes range, Pentelicus, and the sea, in which district lies the plain of Marathon. The rivers of Attica are insignificant, and in summer nearly dry. The Cephissus and Ilissus, the two watering the Athenian plain, are those most frequently mentioned

in history. The soil is light; in ancient times it appears, by careful culture, to have produced a large amount of grain, and figs and olives, the excellence of which was famous in Greece; but in modern days agriculture is neglected, and the products are inconsiderable.—The ancient inhabitants of Attica belonged to the Ionic race; of their origin even tradition conveys no information. They claimed that their ancestors had sprung directly from the soil of the country. At the beginning of authentic Attic chronology, placed by Grote at the archonship of Creon, 688 B. C., they were divided into four tribes or classes (*φύλαι*), Geleontes, Hopletes, Ægikores, and Argades. The origin of these is uncertain, some traditions attributing the quadruple division to Cecrops, others to Pandion, and one to an ancient king, Ion. Grote does not share the belief of many writers that the names of the tribes were derived from their occupations, like those of the Egyptian castes, as Hopletes, the warriors, Ægikores, the goatherds, &c.; and he says of both tribes and titles, "Neither the time of their introduction nor their primitive import are ascertainable matters." In historic times each tribe was divided into three phratries (*φρατρίαι* or *φράτρες*), and each phratry generally into 30 gentes; later another division seems to have been made—purely for political and military convenience and without destroying the former—of each tribe into three trittys (*τρίττες*), and of each trittys into four naukraries (*ναυκράριαι*). This classification of the people continued till the revolution of Clisthenes, in 509 B. C.; but Solon (about 594), without destroying it, made another division into five classes, on the basis of property. Clisthenes entirely abolished both methods of classification, and divided the people anew into ten tribes (*φύλαι*)—Erechtheis, Ægeis, Pandionis, Leontia, Acamantis, Eneis, Cekropia, Hippothoontia, Æantia, and Antiochis—named from old Attic heroes. Each of these was subdivided into a certain number of demes (*δήμοι*) or cantons, every considerable place constituting a deme, and the larger towns including several. The whole number of demes in Attica appears to have been 174, of 160 of which the names are known. To the ten tribes of Clisthenes two more were afterward added for political purposes.—For the account of the system of general government of Attica under the archons and other rulers, and for the history of the country, see **ATHENS**, and **GREECE**. Works especially devoted to Attica are Leake's "*Demi of Attica*" (2d ed., London, 1841), and Rose's *Demen von Attika* (Halle, 1846).—Joined with Boeotia, Megaris, and the adjoining islands, Attica as an eparchy now helps to form one of the nomarchies of the kingdom of Greece, called Attica and Boeotia; area, 2,481 sq. m.; pop. in 1870, 136,804. Capital, Athens.

ATTICUS, **Titus Pomponius**, a Roman knight, born in 109 B. C., died in 32. During the civil wars between Sylla and Marius he re-

moved to Athens, where he spent 20 years and rendered many services to the citizens, who raised statues in his honor. Recalled by Sulla in 65 B. C., he resided in Rome, and was celebrated for his hospitality, numbering among his friends Hortensius, Pompey, Cæsar, Brutus, and above all Cicero. He had no ambition, made a generous use of his great wealth, and during the civil wars was able to be on friendly terms with men of all parties. He starved himself to death to avoid other physical sufferings. He possessed a very extensive library, and employed his slaves to copy MSS., selling the copies. His annals, a general history extending over 700 years, were highly prized by classical writers, but have not come down to us. His name has been preserved by the letters addressed to him by Cicero, and by a biography written by Cornelius Nepos.

ATTICUS HERODES, *Tiberius Claudius*, a rich citizen of Athens, born about A. D. 104, died probably in 180. He opened a school of rhetoric at Athens and afterward at Rome, having Marcus Aurelius for one of his pupils. His speeches are said to have excelled those of all contemporary orators, but none of them are now extant. He was consul in 143, and for a time administrator of the free towns of Asia. Having inherited an immense fortune, he adorned Athens with magnificent public buildings, constructed a theatre at Corinth, aqueducts at Olympia and Canusium, a race course at Delphi, and a bath at Thermopylæ, and restored several decayed cities of the Peloponnesus.

ATTIKAMEGUES, or *Whitefish Indians*, an Algonquin tribe residing inland back of Three Rivers, Canada, closely allied in language to the Kilistenons or Crees. They were noted for their singular care and veneration for the dead. War and disease swept them away about 1658. Father Jacques Buteux, the great missionary of the tribe, was killed among them in May, 1652.

ATTILA (Magyar, *Etelo*; Ger. *Etzel*), king of the Huns, died in 453 or 454. About 434, with Bleda, his brother, he succeeded Roas, his uncle, in the leadership of the nation, which then included or swayed the northern tribes from the Rhine to the Volga. The brothers threatened to invade the eastern empire, but Theodosius II. obtained peace by the surrender of territory south of the Danube and the payment of an annual tribute. Attila assured the Huns that he had discovered the sword of the Scythian god of war, with which he was to procure for them the dominion of the world. He called himself the scourge of God, and his subjects looked on him with superstitious awe. In 444 he ordered the murder of his brother as a dictate of the divine will, and the fratricide was celebrated as a victory. He invaded the Persian dominions, but being defeated in Armenia, he turned toward the eastern empire. With an army of upward of half a million men, mostly cavalry, he overran Illyria and

all the region between the Black sea and the Adriatic. Theodosius II. was overpowered in three battles. Thrace, Macedonia, and Greece were devastated, and more than 70 of the most flourishing cities destroyed. Theodosius obtained peace again only by an enormous ransom. About 451 Attila turned west toward Gaul, marched through Germany, crossed the Rhine, the Moselle, and the Seine, and encamped before Orleans. The inhabitants, encouraged by their bishop Anianus, resisted the first attacks of the assailants, and were soon relieved, on June 14, by the approach of the army of Aëtius, the commander of the Romans, with their allies the Visigoths under Theodoric, the Franks under Meroveus, the Burgundians, the Alans, and other barbarians. Attila retired into Champagne, and took his stand in the Catalaunian plains where Châlons-sur-Marne is now situated, and there fought about the end of June the most murderous battle ever known in European history. (See *AÆTIUS*.) Attila was defeated, and recrossed the Rhine, but in the next year again assailed the empire, invading Italy. He destroyed Aquileia, Padua, Vicenza, Verona, and other cities, whose fugitives afterward founded Venice; pillaged Pavia and Milan, and established his camp at the confluence of the Mincio and the Po, near Mantua. Rome was saved by the personal mediation of Pope Leo I., who visited the barbarian in his camp, and is said to have awed him by his sacred character. The chroniclers say the spirits of the apostles Peter and Paul appeared to him with menaces, a legend immortalized by Raphael. In July, 452, Attila, having concluded a truce, returned to the Danube, meditating for the next year a new invasion of the eastern empire, or, as some maintain, a return to Italy. But he died in his capital or camp in Pannonia, the night of his nuptials with the beautiful Ildico, whom he had married in addition to the many wives he already possessed. The courtiers found him in the morning dead, either through sudden illness, or, as some suspected, through the treachery of Ildico, whose people, the Burgundians, had suffered much at his hands. His body was put in a coffin of iron, over which was one of silver, and a third of gold. He was buried secretly at night together with a mass of treasure and arms, and the prisoners who dug the grave were killed. He is also celebrated as a kind of national hero by the Hungarians.

ATTIRET, *Jean Denis*, a French Jesuit and painter, born at Dole in 1702, died in Peking in 1768. He studied at Rome, and had already produced some good pictures when he entered the society of the Jesuits at Avignon. In 1737 he went to Peking, at the solicitation of the French Jesuit missionaries stationed there, and was employed by the emperor Kien Lung. He produced an immense number of paintings and drawings, mostly in water colors, accurately depicting Chinese physiognomy, dress, and habits, as well as triumphs, festivals, and pro-

cessions. A series of drawings, representing Chinese battles, were engraved in France, so gratifying the emperor that he appointed the artist a mandarin.

ATTIWANDARONK, a tribe of Indians of the same family as the Hurons and Iroquois, living in early times on both banks of the Niagara river, but chiefly on the Canada side. They were called Atirhagenratha by the Iroquois, and by the French the Neutral Nation, as they at first took no part in the war between the Iroquois on one side and the Hurons, Tionontatez, Algonquins, and Montagnais on the other. They were however at war with the Mascoutins beyond Lake Michigan. Their territory was an area of about 150 sq. m. They were first visited by the Recollect father Dailon in 1627, and by Brébeuf and Chaumonot in 1642; but no missions or posts were established. On the fall of the Hurons they were attacked by the Iroquois (1651-'8), and after severe losses a part submitted and joined the Senecas; the rest fled west and joined the remnant of the Hurons on Lake Superior.

ATTLEBOROUGH, a township of Bristol county, Mass., 31 m. S. S. E. of Boston, and 11 m. N. N. E. of Providence, R. I.; pop. in 1871, 6,769. It has very extensive manufactures of jewelry, printed calicoes, metal buttons, and clocks, for which there is abundant water power in Mill river.

ATTOCK, or *Atak*, a fortified town of India, in the Punjab, on the Indus, nearly opposite the mouth of the Cabool, in lat. 33° 54' N., lon. 72° 20' E., 40 m. E. S. E. of Peshawer;

pop. about 2,000. The Indus is here about 800 feet wide, and from 80 to 70 feet deep according to the season, with high banks and a rapid current. The fort was built by Akbar to command the passage, this being the route by which invasions from the northwest have generally entered India. Runjeet Singh took it from the Afghans by treachery, and it came into the possession of the British by the conquest of Sind. The town has gone to decay.

ATTORNEY. See **LAWYER**.

ATTORNEY GENERAL, a law officer of state. In England he is the counsel to the crown. He

may be required by either of the houses of parliament to institute prosecutions for offences against the honor and dignity of the houses, or against the public laws of the nation, and by custom may prosecute for misdemeanors by information without first procuring an indictment. He may also file information in civil causes, under penal statutes, and he is charged by special statutes with other duties in the public interest.—The attorney general of the United States is the first law officer of the government. The judiciary act of 1789, which first defined his office, provided that there should be appointed a meet person, learned in the law, whose duty it should be to prosecute and conduct all suits in the supreme court in which the United States should be concerned, and to give his advice and opinion upon questions of law when required by the president or by the heads of any of the departments touching any matters which concerned the affairs of their offices. By an act of 1830 the attorney general was required to consult and advise with the solicitor general of the treasury as to the conduct of suits and other proceedings pertaining to the revenue; and by an act of 1861 he was charged with a general supervision and direction of the district attorneys and marshals of the United States, and of their discharge of their duties; and they were required to report to him an account of their proceedings and the condition of their offices. In practice also it has been conceded that either house of congress may call upon the attorney general for information on any matter within the scope of

his office, and that it is his duty to communicate such information. He has also conducted all suits of the United States in the supreme court. It has been always understood that the opinion of the attorney general is not conclusive upon the president or the secretaries; but it has been the practice, for the sake of preserving harmony and uniformity of decision and action in the different departments, to govern the administration of their affairs according to the attorney general's advice. The opinions of the attorneys general from the earliest period have

thus come to be a body of precedents on questions of public law which have a certain authority, of the same character, though not of the same imperative force, as the adjudication of courts of justice. It is a settled rule, in construction of the functions of this officer, that he has no right to give an opinion in any other cases than those in which the statutes make it his duty to give it. Therefore he will not give an opinion to any subordinate officer of any of the departments; nor will he give an opinion to individuals in respect to their claims against the government;

nor will he advise upon speculative or hypothetical cases, nor upon any point of law unless it has actually arisen in a case presented for the action of a department. An act of June 22, 1870, established an executive department of the government, called the department of justice, and made the attorney general the head of it. The statute provides for the appointment of a solicitor general and of assistants to the attorney general, and transfers to the department the solicitors of the treasury, of the navy, and of the internal revenue, the naval judge advocate, and the clerks and assistants of these officers. It authorizes the attorney general to refer questions submitted to him to his assistants, and their opinions approved by him have the force of his own. He may direct the solicitor general to argue causes in the court of claims in which the United States is interested, and appeals from that court to the supreme court in such cases as are committed to him and to the solicitor general. The secretaries of the war and navy departments may also by this act require opinions from the attorney general on questions of law the cognizance of which is not given by statute to other officers.—The duties of the attorney general of a state are defined by constitutional or statutory provisions. They are generally to prosecute and defend all kinds of actions in the event of which the people of the state are interested; to recover for the state escheated lands or forfeited estates; to test the right of any person who is charged with unlawfully holding or exercising any public office or any franchise within the state, or the right of persons who are alleged to be acting as a corporation without authority; to bring actions for the purpose of vacating the charters or revoking the franchises of corporations for violations of the provisions of the acts which created them, or when they have incurred forfeiture of their charters by nonuser of their franchises, or the assumption of privileges not conferred upon them. It is also his function to give legal advice to the governor and to other officers of the state; to prepare legal instruments for the use of the state; and at the request of the governor or other state officials to indict and prosecute persons accused by such officers of violations of the laws which they are charged with enforcing.

ATTORNEY, Power of, an authority by which one person is empowered to act in the place or as the attorney of another. The one who confers the power is called the constituent or the principal, and the one to whom it is given is called the attorney in fact, that is to say, *in factum* or for a special purpose, and by way of general distinction from a professional attorney at law.—All persons except those who have not a legal capacity to act for themselves, such as married women and infants, may appoint an attorney in fact. But under the recent acts which give married women separate estates and independent powers over them, they also

may, as to such property at least, probably appoint attorneys. All persons who have sufficient intelligence may be made attorneys in fact, including even some who are disqualified from acting for themselves, such as married women and minors, provided they are of sufficient age and discretion. The power of attorney may for many purposes be created by parol, but usually it is reduced to writing. If the power contemplates the making of a deed by the attorney, his authority must also be by deed, that is to say, by writing under seal, and must be executed and acknowledged with the same formalities which are required in the case of deeds.—In the interpretation of powers of attorney they are to be construed strictly, and this rule should be kept in view in framing such instruments. The power may be broad or narrow. It may be general, extending to all the affairs of the constituent, or it may be special, and limited to some particular subject or to some particular class of the affairs of the principal. In view of the rule of construction just suggested, a special power should be very explicit, enumerating as minutely as is practicable all the acts which the attorney may perform, although all acts will be sustained which are fairly within the scope and design of the power, even though they are not specifically named. And the power had best be thus special and particular, if possible, rather than general; for the courts incline to construe even general powers narrowly rather than broadly, and even the general clause usually inserted in special powers, as for example, to do all other acts which the constituent might do in the premises, is usually interpreted with reference to the special matters enumerated, and is held to authorize only such acts as are fairly required in the performance of them. A general authority to make and indorse notes, the power being apparently conferred to enable the attorney to carry on the business of his principal in his absence, would be limited to notes to be used in that business; an authority to collect all demands, and to accomplish a complete adjustment of all the principal's affairs, would not authorize the attorney, in the course and for the purposes of such a general settlement, to give a note in the name of the principal; and it has been held that an authority to endorse notes does not empower the attorney to receive notices of protest, and that a general power given by a member of a firm to his copartner to transact all his business, whether relating to him as a partner or as an individual, does not authorize the attorney to transfer the individual property of the principal to a trustee for the payment of his debts. So a power to sell or convey lands does not give a power to mortgage, nor does it authorize such other dealing with the lands as a license to enter and cut timber. If the power looks to conveyance of real estate and to the giving of deeds, it should state expressly whether the attorney may exchange or lease or mortgage

the lands as well as convey them absolutely; and if the attorney is to give deeds, whether he may give deeds with full covenants; or if he is to make a mortgage, whether he may give with it a power of sale; though it has been held in New York that such an authority is fairly implied in a power to mortgage, because there a power of sale is a usual and virtually essential incident of a good mortgage, but it is not or may not be so in all the states. The power conferred may be a mere naked authority to the attorney, in which case it is revocable at the will of the constituent, and necessarily expires with his death; or it may be coupled with an interest in the attorney, as the phrase is, and in that case the power cannot be revoked by the principal, nor does his death annul it. Thus a mere power to collect debts due the principal is such a naked and revocable power. But if by assignment or by virtue of an agreement with the principal, or in any other way, the attorney has an interest in the very debts themselves, the power is then coupled with an interest, and the attorney cannot be compelled by the constituent to surrender it. A mere recital in the instrument that it is irrevocable will not make it so, unless one or other of these conditions exist. All conditions in the power must be strictly observed; as for example, if the consent of third persons is required, it must be procured; and if the consent of several persons were required, the death of one of them would prevent the execution of the power, for the consent even of all the survivors is not the consent that the power calls for.—It is a general rule of law that an authority given to one person cannot be delegated by him to another; and accordingly, when it is desired to give an authority to the contrary to the attorney, it must be expressly set forth in the power. Such a power, commonly called a power of substitution and revocation, is usually inserted in powers of attorney. When an attorney having such a power has appointed another attorney in his stead, his death annuls the power of his substitute. The death of the principal cancels the power of the attorney at once. And his power is annulled upon an actual revocation by the principal when the revocation is communicated to him, and as to third persons when it is made known to them. In executing the power, the attorney should act in the name of his principal. For example, if he gives a deed, the deed should run in the name of the principal, and be signed first with his name, the attorney adding his name and authority afterward.

ATTRACTION. See **ADHESION**, **COHESION**, **GRAVITY**, and **MAGNETISM**.

ATTUCKS, Crispus, a mulatto, or half-Indian, resident of Framingham, Mass., one of the persons killed on the evening of March 5, 1770, in the affray known as the "Boston Massacre." John Adams, in his defence of the soldiers,

accuses him of having been the principal leader of the attack on the British troops. His body was placed with that of Caldwell in Faneuil hall, and from that building it was borne with great ceremony by the people, and buried in the city burial ground, in one vault with the other victims of the riot.

ATTWOOD, Thomas, an English composer, born in 1767, died in 1838. At the age of 16 he attracted the favorable notice of the prince of Wales, who sent him to Italy to be educated. At Vienna he was the pupil of Mozart till 1786, when he returned to England. He wrote operas, songs, glees, trios, and in the latter part of his life sacred music. His works are marked by knowledge of orchestral effects, and are vigorously written.

ATYS, or **Atty**, in Greek mythology, a son of Nana, a nymph, according to some legends, by a Phrygian king. The traditions differ about the fate of Atys, the most current ones making him beloved by Cybele, who made him her priest on his taking a vow of perpetual chastity; this he broke, and was punished by the goddess with madness, in which he castrated himself and attempted suicide; but the goddess restored him to his senses, and allowed him to continue in her service, decreeing at the same time that all her priests thereafter should be eunuchs. A festival was annually celebrated in memory of Atys at Pessinus. The myth is supposed by many writers to typify, in the powerlessness, death, and subsequent revival of Atys, the death of nature in the winter, and its revival in the spring through the agency of superior power.

AUBAGNE, a town of France, in the department of Bouches-du-Rhône, 10 m. E. of Marseilles; pop. in 1866, 7,408. The town is known for its excellent red wines. Near it the abbé Barthélemy was born.

AUBAINE, *Right of* (low Lat. *albanus*, a corruption of *alibi natus*, foreign born). See **ALIEN**, vol. i., p. 813.

AUBE, a department of France, in Champagne, bounded by Marne, Haute-Marne, Côte d'Or, Yonne, and Seine-et-Marne; area, 2,145 sq. m.; pop. in 1872, 255,687. The surface is mostly level; the soil in the southeast is productive, but in the remaining portions it is poor. It is traversed by the Seine and its eastern affluent the Aube, which rises in the plateau of Langres in Haute-Marne. The department has manufactories of pottery, tiles, and glass. It is divided into the arrondissements of Troyes, Arcis-sur-Aube, Bar-sur-Aube, Bar-sur-Seine, and Nogent-sur-Seine. Capital, Troyes.

AUBENAS, a town of France, in the department of Ardèche, situated on the right bank of the Ardèche and at the foot of the Cévennes, 13 m. S. W. of Privas; pop. in 1866, 7,694. It has a college and a theological seminary, and is the centre of the wine and corn trade of the department.

AUBER, Daniel François Esprit, a French composer, born at Caen, Jan. 29, 1782, died in

Paris, May 13, 1871. His father, a print-seller at Paris, in prosperous circumstances, allowed him to devote much attention to the study of music, merely as an amusement or an elegant accomplishment. After a brief experience in mercantile life in London, he returned to Paris, and devoted himself to music, giving forth a number of little compositions, vocal and instrumental, including a new arrangement of the opera *Julie*. After a course of study with Cherubini, he produced in 1813 the opera of *Séjour militaire*, which failed; and its reception so discouraged him that for several years he abandoned the art. The death of his father, however, compelled him seriously to devote himself to it as a means of support, and in 1819 he produced at the opéra comique *Le testament et les billets-doux*, an opera in one act, which was likewise unsuccessful. Next he wrote *La bergère châteline*, which was produced in the same theatre in the early part of the year 1820, and completely turned the tables in his favor. From this time forward he produced a great number of works, almost all of which were well received, while some are among the most successful operas now represented on the stage. An imitator of Rossini at the outset, he gradually acquired greater independence of style, and in *La muette de Portici* (also known as *Masaniello*) he formed a style of his own. In addition to the works mentioned, *Le cheval de bronze*, *Fra Diavolo*, *Le domino noir*, *Les diamants de la couronne*, *L'élizir d'amour*, *Le dieu et la bayadère*, *Gustave*, *La sirène*, and *Haydée* are among his most popular operas. Many of them have been translated into English and German, and almost all into Italian, and their melodies are familiar wherever music is known. *Marco Spada* was produced when he was 71 years of age; *La Circassienne* when he was 79; *La fiancée du roi de Garbe* when he was 82; and his last work, *Le premier jour de bonheur*, at the age of 86. The successful production of this opera in February, 1868, was made the occasion of enthusiastic demonstrations of the old maestro's popularity. He wrote a march for the opening of the world's exhibition in London in 1862. He was elected to the French institute in 1829, became a chevalier of the legion of honor in 1825 and grand officer in 1861, and succeeded Cherubini as director of the conservatory in 1842. The characteristics of Auber's music are sprightliness and grace, with clearness and simplicity in dramatic effect.

AUBERT, Constance. See ABRANTÈS.

AUBERVILLIERS, a village of France, in the department of the Seine, 1 m. N. of the enceinte of Paris; pop. in 1866, 9,240. E. of it is a fort of the same name, built in 1842. The village church formerly possessed a picture of the Virgin which was believed to be miraculous, and on that account was called Notre Dame des Vertus.

AUBIGNÉ, J. H. Merle d'. See MERLE D'AUBIGNÉ.

AUBIGNÉ, Théodore Agrippa d', a French Protestant soldier and historian, born at St. Maury, Feb. 8, 1550, died in Geneva, April 29, 1680. Even as a child his attachment to his religion attracted the attention of the Roman Catholics, and his refusal to abjure it caused him to be sentenced to death before he was 13 years of age. Aided by a friend, the boy escaped, and was present at the siege of Orleans. This ended, he went to pursue his studies at Geneva; but in 1567 he joined the Huguenot army under the prince of Condé, and served nearly two years with such bravery and ability as to secure the marked favor of the young Henry of Navarre, the future Henry IV. of France, whose service he subsequently entered, remaining with him through the war, and living at court after the peace. But he quarrelled with the king, his blunt candor and rude sarcasm constantly giving offence, and several times left or was compelled to leave Henry's service, though the king trusted him, and at one time bestowed offices of some honor upon him. He produced during his residence at court *Circé*, a tragedy, abounding in sarcasm directed against the king and various members of the royal family. After the king's death he published his first three volumes of the history of his time (from 1556 to 1601). The third volume was seized and burned by order of parliament, and he fled to Geneva, thus escaping the sentence of death that was soon pronounced against him. While under this condemnation, he offered his hand to a Genevese lady of the name of Burlamaqui, who did not hesitate to accept him as husband after he had revealed his dangerous position with his wonted candor. By a former marriage he had one son, Constantine, who became the father of the celebrated Madame de Maintenon. D'Aubigné was buried in the church of St. René at Geneva. Besides those already mentioned, he wrote many less noteworthy works.

AUBIN, a town of France, in the department of Aveyron, 16 m. N. E. of Villefranche; pop. in 1866, 8,863. It is the centre of a rich coal region, which has of late been yielding about 5,000,000 quintals of coal annually. The neighboring village of Le Gua has five furnaces for the smelting of iron.

AUBLET, Jean Baptiste Christophe Fusée, a French botanist, born at Salon, in Provence, in 1720, died in Paris in 1778. He is celebrated for his botanical labors in Mauritius and in French Guiana. His herbarium was purchased by Sir Joseph Banks, and is now in the possession of the British museum.

AUBURN, a city and the county seat of Cayuga county, N. Y., 174 m. by rail W. of Albany, and 2 m. N. of Owasco lake, the outlet of which intersects the town; pop. in 1860, 10,986; in 1870, 17,225. It stands on high, uneven ground, and is handsomely built, with wide streets planted with shade trees. It has 16 churches, of which 3 are Methodist, 4 Presbyterian, 3 Roman Catholic, 2 Episcopal, 2 Baptist, 1 Dis-

cipling, and 1 Universalist; and it is the seat of a Presbyterian theological seminary founded in 1821. To this has been recently added a large building for a library, the gift of William E. Dodge of New York and E. B. Morgan of Aurora. Auburn also has an orphan asylum, a home for the friendless, a young men's Christian association with reading-rooms, one high school, six district schools, and a young ladies' institute, eight banks, several hotels, and two opera houses. Two daily newspapers, four weeklies, and one monthly are published here. Water works on the Holley plan supply the city. The Auburn state prison, founded in 1816, is conducted on the "silent system." It is a fine massive structure of limestone, covering, with its cells, yards, and workshops, 12 acres. The prison buildings are arranged in the form of a hollow square, standing at a distance from the outer wall, which surrounds them. This wall, which is 3,000 ft. long, 4 ft. thick, and 12 to 35 ft. high, is manned night

Auburn State Prison.

and day by guards. The prison has usually over 1,000 convicts (in 1872, 1,100), who are employed in a variety of manufactures, the proceeds of which are generally sufficient to defray the expenses of the institution. Each convict on arrival is assigned to work at the trade with which he is familiar, or, if ignorant of any, is taught one. Among the principal of these are the hame shop, tailors', shoemakers', cloth and carpet weaving, cabinet, sash and blind, cooper, stone-cutters', tool, axletree, smith, and machine shops. The convicts make such articles as they use, and build such structures as they occupy. They sleep in separate cells, but at meals and in the shops are together. No communication by word or sign is allowed. In an adjoining enclosure of nine acres is the state asylum for insane criminals, founded in 1857. It has usually 80 to 100 inmates. The Owasco lake supplies one of the best water powers in the state, which is utilized by nine

dams, the river falling within the city limits 160 ft. There are upward of 20 factories and mills, the chief of which are those of cotton and woollen fabrics, carpets, agricultural implements (many of which are exported to Europe), machine shops and tool factories, flouring mills, and breweries. These manufactories employ a capital of from \$4,000,000 to \$5,000,000. Valuable limestone quarries are worked within the city limits. One of the two branches of the New York Central railroad runs through Auburn. The Southern Central railroad also passes through it, connecting it with Lake Ontario and the Pennsylvania coal mines. Auburn, formerly called Hardenburgh's Corners, was first settled by Capt. John L. Hardenburgh in 1793. At a short distance from the court house stands an elevation called Fort Hill, in the forest on the summit of which were found the ruins of an ancient Indian fortification and relics of its former occupants, such as arrow-heads, tomahawks, and pottery. It is

now the site of a cemetery, prominent among whose monuments is one to the memory of Logan, the Cayuga chief.

AUBUSSON, a town of central France, capital of an arrondissement of the department of Creuse, built in a picturesque gorge near the river Creuse, 20 m. S. E. of Guéret; pop. in 1866, 6,625. It is celebrated for its manufacture of carpets, which employs the majority of the inhabitants. Woollen and cotton goods are also made, and there are dye houses, tan yards, and factories of various kinds. The town was founded in the 8th century, and was subject to a feudal lord, the ruins of whose castle are still visible.

AUBUSSON, Pierre d', grand master of the hospitallers, or knights of St. John of Jerusalem, born at Larmarche, France, in 1423, died in 1508. He is said to have first served in the Hungarian armies against the Turks. In 1444 he accompanied the dauphin, afterward Louis XI., in his campaign against the Swiss. He next repaired to the island of Rhodes, where he was admitted as a knight of St. John. He soon became a prominent member of the order, and on the death of the grand master Des Ursins he was unanimously elected his successor. When Mohammed II. threatened Italy, D'Aubusson had Rhodes strongly fortified, at the same time forming an alliance with the bey of Tunis and sultan of Egypt. Mohammed sent against Rhodes a fleet of 160 sail, carrying an army of 100,000 men, under the command of the apostate Misach Palaeologus (Messih Pasha). The Turks invested the town of Rhodes at the end of May, 1480. D'Aubusson, who made an admirable defence, was so se-

verely wounded that his life was despaired of; but he compelled the Turks to raise the siege after two months. He now became active in the intrigues that troubled the court of Constantinople. He received at Rhodes Zizim or Jem, the brother of Sultan Bajazet, who became in his hands a powerful instrument of influence on the Turkish court. Zizim was first transferred to France, then delivered to Pope Innocent VIII., who rewarded D'Aubusson with the title of cardinal and the office of legate of the holy see in Asia. But the failure of a plan he had long cherished for the union of Europe against the Turks, together with other disappointments, caused him to retire from affairs, and his last years were spent in Rhodes.

AUCH, an old city in southern France, capital of the department of Gers, on the river Gers, 41 m. W. of Toulouse; pop. in 1866, 12,500. Its upper part is situated on a high hill crowned by an old Gothic cathedral, and connected with the lower by a long bridge of stairs. Auch is the seat of an archbishopric, a tribunal of commerce, and a college. It has manufactures of thread and cotton stuffs, and carries on a considerable trade, particularly in the brandies of Armagnac.

AUCHMUTY. **I. Robert**, an American lawyer, born probably in England, died in Boston in April, 1750. He was of Scotch descent, settled at Boston early in the 18th century, attained a high position in his profession, and was appointed judge of the court of admiralty in 1733. In 1741 he was in England as agent for the colony, and published there a pamphlet entitled "The Importance of Cape Breton to the British Nation, and a Plan for Taking the Place." **II. Robert**, son of the preceding, died in London in 1788. He was distinguished as an advocate and jury lawyer at Boston, and in 1767 was appointed judge of the court of admiralty, which office he exercised as long as the royal authority was recognized; but in 1776, being a zealous tory, he went to England. He was associated with John Adams in the defence of Capt. Preston. **III. Samuel**, an American clergyman, brother of the preceding, born in Boston, Jan. 26, 1722, died in New York, March 6, 1777. He graduated at Harvard college in 1742, and went to England to study for holy orders. After his ordination he was appointed by the society for the propagation of the gospel an assistant minister of Trinity church, New York, and in 1764 succeeded to the charge of all the churches in the city. When the American troops took possession of New York in 1775, he was forbidden by Lord Stirling to read the prayer for the king; but he persisted in doing so, although his church was entered by a company of soldiers with drums beating and with the threat of pulling him out of the pulpit. He then shut up the church and chapels and took the keys with him to New Jersey, leaving orders that the churches should not be opened until the liturgy could be read without interruption. New

York being again in the British possession, he attempted to return, and succeeded after great hardships only to find his church and parsonage burnt, and his papers and the records of the church destroyed. The next Sunday he preached for the last time in St. Paul's. The various trials he had undergone brought on an illness which carried him off in a few days. **IV. Sir Samuel**, a British general, son of the preceding, born in New York, June 22, 1758, died in Dublin, Aug. 11, 1822. He graduated at Columbia college in 1775, and the next year entered the army under Sir William Howe, and took part in three campaigns. From 1783 to 1796 he served in India, and was at the siege of Seringapatam in command of a company under Lord Cornwallis. He was adjutant general in the expedition to Egypt in 1800. In 1806 he took command of the troops ordered to South America, with the rank of brigadier general, and in 1807 carried the strongly fortified city of Montevideo by assault. On his return he was made lieutenant general. In 1810 he was commander-in-chief in the Carnatic, and in 1811 took possession of the Dutch colonies of Java and Sumatra. On his return to Europe in 1813 he was appointed commander of the forces in Ireland.

AUCKLAND. **I. William Eden**, baron, a British diplomatist, born about 1750, died in 1814. In 1778 he was employed with Lord Carlisle in the attempt at a settlement of the rupture between the British government and the American colonies. He entered parliament, was secretary of Ireland, and was sent to the court of Louis XVI., where he negotiated a commercial treaty. On the breaking out of the revolution of 1789 he was sent to the Netherlands as envoy extraordinary; and for the manner in which he discharged his duties there he was called to an account by the house of commons on his return. He was created a baron in the Irish peerage in 1789, and also in the British peerage in 1793. He wrote "Principles of the Penal Laws" (1771), and various pamphlets, including one on the "State of the Poor in England." **II. George Eden**, earl of, son of the preceding, born in August, 1784, died Jan. 1, 1849. He was president of the board of trade under Earl Grey in 1830, and first lord of the admiralty under Lord Melbourne in 1834. The next year he went to India as governor general. During his administration of this office the opium war with China broke out, and the disastrous expedition against Afghanistan took place. Lord Auckland's chief personal action was exercised upon a system of native free schools, and an improved administration of justice. In 1841 he was succeeded by Lord Ellenborough, and on his return was created earl of Auckland and Baron Eden.

AUCKLAND. **I.** A province of New Zealand, occupying the north and centre of North island; area, about 30,000 sq. m.; pop. in 1871, 62,335, besides 16,000 Maoris. **II.** A city, capital of the preceding province and formerly of

Auckland, New Zealand.

New Zealand, on the S. shore of Waitemata harbor, in lat. $36^{\circ} 51'$ S., lon. $174^{\circ} 45'$ E.; pop. in 1871, 12,937; with suburbs, 18,000, chiefly English, Irish, Scotch, and Germans. The town was founded in 1840, and became a borough in 1851. It includes an area of 16 by 7 m., is surrounded by four villages for pensioned soldiers, and divided into 14 wards, 11 of which are outside of the town. The streets are well laid out. There are several churches, including an English cathedral. St. John's college is 4 m. from the town. The number of registered vessels is upward of 100. Gold was first discovered near Auckland in 1852, but the mines are not as productive as those in other parts of New Zealand. Coal fields and petroleum were found in 1859 and 1867. The chief exports are gold, wool, and gum; the imports are manufactured goods, tea, tobacco, sugar, wine, spirits, and beer. Emigration to Auckland is checked by the insurrection of the Maoris, who in November, 1871, committed several murders in the province, including that of Bishop Patterson. The seat of the colonial government has within a few years been removed to Wellington.

AUCKLAND ISLANDS, a group lying between lat. $50^{\circ} 24'$ and $51^{\circ} 4'$ S., and lon. $163^{\circ} 46'$ and $164^{\circ} 8'$ E., 180 m. S. of New Zealand, and 900 m. S. E. of Tasmania. They were discovered Aug. 16, 1806, by Abraham Briscoe, master of Messrs. Enderby's English whaler Ocean, and called after Lord Auckland. They are of volcanic formation, and consist of three principal islands, the largest of which is Auckland proper, 80 m. long and 15 m. wide, with an area of 100,000 acres and a mountain 1,850 feet high. Port Ross, at the W. extremity of the island, contains an inlet called Laurie harbor, the station of the southern whale-fishing com-

pany of the Messrs. Enderby, to whom the islands were granted by the British government, and who obtained a charter for this company in 1849; but the establishment was broken up in 1852. The most northerly of the group are called Enderby islets. The island of Ichaboe contains guano deposits. The soil of the Auckland islands is very productive.

AUCTION (Lat. *auctio*, the act of increasing), a public sale, whereat persons openly compete, the property being sold to him who will give the most for it. In Holland, and at what are called Dutch auctions elsewhere, this process is reversed, the seller naming a price beyond the value of his goods, which is gradually lowered until some one closes with the offer. Rome, so far as is known, invented the auction, which was at first held for the sale of military spoils among the soldiers behind a spear stuck in the ground, whence it was called *auctio sub hasta* (under the spear), or *subhastatio*. The signal of the spear was afterward put up at all sorts of auctions, and the name was retained long after the signal was disused. After the death of Pertinax, A. D. 193, the prætorian guards put up the Roman empire at auction, which, after a number of bids by Sulpician and Didius Julianus, the sole competitors, was knocked down to the latter for 6,250 drachms (about \$1,000) to each soldier.—In England sales "by the candle" or "by the inch of candle," which are still occasionally advertised, derive their name from an ancient practice of measuring the time within which the biddings must be completed by a candle, the highest bidder at the moment the inch burns out becoming the purchaser. The minimum price at which the owner was willing to part with his property was sometimes put under a candlestick—"can-

dlestick biddings;" and in the north of England still occur sales where the bidders do not know each other's offers—"dumb biddings."—In point of law, the auctioneer is the seller's agent, and as such has a special property in the goods, a lien upon them or upon the purchase money, where he is authorized to receive it, for his commission, the auction duty, and the charges of the sale. If he exceed his authority, or refuse to give the name of his principal, he renders himself personally liable. In sales of real estate he is usually authorized to receive the deposit, but not the residue of the purchase money. The conditions of sale and the plans and description of the property, if printed or written, control the oral statements of the auctioneer. Slight inaccuracies of description do not, but substantial ones do avoid the sale. A bid at an auction may be retracted before the hammer is down, and, in cases where a written entry is required to complete the sale, before that is made. For a bid is only an offer, which does not bind either party until assented to. Fraud upon either side avoids the sale. The employment of bidders by the owner is or is not illegal, according as circumstances tend to show bad or good faith. To employ them in order to prevent a sacrifice by buying in the property is, except where the sale is advertised as being "without reserve," allowable; but it is a fraud to use them for the purpose of enhancing the price through a fictitious competition. On the other hand, the sale is void if the purchaser prevails upon others to desist from bidding by appeals to their sympathy or false representations.

AUDE, a maritime department of France, in Languedoc, bounded by the Mediterranean and the departments of Pyrénées-Orientales, Ariège, Haute-Garonne, Tarn, and Hérault; area, 2,437 sq. m.; pop. in 1872, 285,927. It is subject to violent gales. The surface is mountainous and hilly, the soil generally productive. The canal of Languedoc intersects the northern part of the department from W. to E., and the canal of Robine or Narbonne crosses the eastern portion from N. to S. Corn and wine are abundant, and are exported. The river Aude rises near its S. border in Pyrénées-Orientales, flows N. as far as Carcassonne, and then along the S. bank of the Languedoc canal to Narbonne, a few miles E. of which it falls into the Mediterranean. The Lers, an affluent of the Ariège, flows along the W. border. The department is divided into the arrondissements of Carcassonne, Castelnaudary, Limoux, and Narbonne. It has manufactures of woollen cloths, paper, iron ware, brandy, salt, and earthenware. Capital, Carcassonne.

AUDEBERT, Jean Baptiste, a French painter and naturalist, born at Rochefort in 1759, died in 1800. He studied painting in Paris, and became distinguished for his miniatures. Having been employed to paint some specimens of natural history, he acquired an absorbing interest in the science. A journey through

England and Holland furnished materials for a number of admirable designs, which appeared shortly afterward in Olivier's *Histoire des insectes*. The artist next prepared his *Histoire naturelle des singes, des makis et des galéopithèques* (Paris, 1800), containing 16 colored plates, and showing an equal facility in the author as designer, engraver, and writer. The splendor of his coloring had never been equalled, and by certain ingenious processes, such as the application of gold leaf variously tinted, he was enabled to reproduce the most gorgeous plumage of birds and insects. His substitution of oils for water colors is also considered a great improvement in the art of animal illustration. His other works, *Histoire générale des colibris, des oiseaux-mouches, des jacamars et des promerops* (Paris, 1802), and *Histoire naturelle des grimpeurs et des oiseaux de paradis*, were published after his death, and are still among the most esteemed of their kind.

AUDLEY, Thomas, lord, lord chancellor of England, in the reign of Henry VIII., supposed to have been born at Earl's Colne, in Essex, died at his London residence in 1544. In 1529 he was made speaker of the house of commons in that long parliament which broke up the smaller religious houses throughout the kingdom. In 1532 he was knighted, and succeeded Sir Thomas More as keeper of the great seal, and on Jan. 26, 1533, became lord chancellor of England, which office he retained until his death. Audley presided at the trial of Sir Thomas More. In the distribution of the church lands, the priory of the canons of the Holy Trinity, usually called Christ church, in London, with all the real estate of the establishment, and the great abbey of Walden in Essex, fell to his share. The former he altered into a town residence for himself. In 1538 he was created Baron Audley of Walden. In 1542 he gave certain lands toward the support of the institution then known as Buckingham college, Oxford, which was thereupon incorporated under the name of St. Mary Magdalen.

AUDOUARD, Olympe, a French traveller and writer, born about 1830. Having separated from her husband, who was a notary of Marseilles, she visited Egypt, Turkey, Russia, and the United States, contributing to newspapers and delivering lectures in New York (1868) and in Paris (1869). Her principal works are: *Comment aiment les hommes* (1861; 3d ed., 1865); *Les mystères du serail et des harems turcs* (1863); *Les mystères de l'Égypte dévoilés* (1865); *Guerre aux hommes* (1866); *L'Orient et ses peuplades* (1867); *Lettre aux députés, les droits de la femme* (1867); and *À travers l'Amérique du Nord* (Paris, 1871).

AUDOUIN, Jean Victor, a French entomologist, born in Paris, April 27, 1797, died Nov. 9, 1841. He married the daughter of Alexandre Brongniart, with whom and with Dumas he established in 1824 the *Annales des sciences naturelles*. He succeeded Latreille as professor of entomology at the museum, obtained his

diploma as a physician in 1826, became sub-director of the library of the institute, founder and president of the entomological society, and in 1838 member of the academy. At the request of the government he investigated the injury caused by insects to the silk and vine culture, and published the results of his observations in the annals of the academy and of the entomological society. He described Savigny's zoological designs in the great work on Egypt published under the auspices of the government, contributed to various cyclopædias, and published with Milne-Edwards, his collaborator in many other works, *Recherches pour servir à l'histoire naturelle du littoral de la France* (2 vols., Paris, 1830); and with Milne-Edwards and Blanchard, *Histoire des insectes nuisibles à la vigne, et particulièrement de la pyrale, qui dévaste les vignobles* (Paris, 1842).

AUDRAIN, a N. E. county of Missouri; area, 680 sq. m.; pop. in 1870, 12,307, of whom 1,070 were colored. The surface is level or undulating; the soil is generally fertile and suitable for grazing. In 1870 the county produced 44,545 bushels of wheat, 648,968 of Indian corn, 292,435 of oats, 12,226 tons of hay, 6,850 lbs. of tobacco, 28,223 of wool, and 241,855 of butter. Capital, Mexico, on the North Missouri railroad.

AUDRAN, the name of a celebrated family of French engravers, all descending from Louis Audran, an officer of the wolf-hunt under Henry IV., whose son **CLAUDE**, born in 1592, settled at Lyons, became professor of engraving at the academy of that city, and died in 1677. **GÉRARD**, son of Claude, born at Lyons in 1640, studied three years at Rome under Carlo Maratti, and acquired fame by his engraving of a portrait of Pope Clement IX. Colbert invited him to Paris, where he, with almost unparalleled ability, engraved for Louis XIV. the best pictures of Le Brun. He was also the author of a work on the proportions of the human figure, published in folio, with 27 plates of ancient statues. He died in Paris in 1703. **JEAN**, brother of Gérard, born about 1667, had his studio in the Gobelins, and left a number of fine works of art, the most celebrated of which is his engraving of the *Enlèvement des Sabines*, after Poussin. He died in 1756. Several others of the family attained considerable distinction.

AUDUBON, a S. W. county of Iowa; area, 630 sq. m.; pop. in 1870, 1,212. It is intersected by an affluent of the Missouri. In 1870 the county produced 26,174 bushels of wheat, 98,150 of Indian corn, 7,100 of oats, and 8,457 tons of hay. Capital, Exira.

AUDUBON, **John James**, an American ornithologist, born on a plantation in Louisiana, May 4, 1780, died in New York, Jan. 27, 1851. He was the son of an officer in the French navy. When very young he showed the greatest fondness for birds, keeping many as pets. He made sketches of these, and, disclosing considerable talent as a draughtsman, was taken

to France to be educated, and placed in the studio of the celebrated painter David. He was 17 years old when he returned to his native country, and he afterward became possessed of a fine farm on the banks of the Schuylkill in Pennsylvania. His researches into the habits of birds, and his drawings of them, absorbed his attention, and though unsuccessful at first in bringing his drawings before the public, he laid during the years of his life in Pennsylvania the foundations of the great work which he afterward produced. A severe trial befell him when, after having accumulated a large stock of the most carefully executed designs, he discovered that the whole of them had been destroyed by mice. After 10 years' residence in Pennsylvania, he removed to Henderson, Kentucky, where he embarked in trade. In 1810 he made the acquaintance of the Scotch ornithologist Alexander Wilson, who was then prosecuting his own researches in the American wilderness, and accompanied him in his excursions. The next year Audubon visited the bayous of Florida, gathering with his rifle and pencil new subjects for study. In 1824 he went to Philadelphia and New York, to make arrangements for the publication of the results of his labors; and for the same purpose he sailed for England in 1826. He was everywhere received by learned societies and scientific men with the utmost cordiality and enthusiasm. Among his warmest admirers in Great Britain were Jeffrey, John Wilson, and Sir Walter Scott; and in Paris, Cuvier, Geoffroy St.-Hilaire, and Humboldt. Of the 170 subscribers at \$1,000 each to his splendid volume, the "Birds of America," nearly one half came from England and France. This volume was issued in numbers, containing five plates each, every object being of the size of life. By Nov. 11, 1828, eleven numbers of the work had appeared, with nearly 100 plates. In 1829 he returned to the United States, where he gathered materials for a new work, which he termed his "Ornithological Biographies." In 1832 he made another visit to England, where in the course of two years the second volume of the "Birds of America" was published, and a second volume also of the "Ornithological Biographies." In 1833, having returned for the last time to this country, he established himself in a beautiful residence on the banks of the Hudson, near the city of New York, where he commenced a new edition of the "Birds of America," in imperial octavo. This was finished in seven volumes in 1844. During this interval Audubon exhibited in the hall of the New York lyceum of natural history a collection of his original drawings containing several thousand specimens of birds and animals, all of which had been gathered by his own hand, all drawn as large as life, and all represented in their natural habitats or localities. He next projected a work on the "Quadrupeds of America," on the same imperial scale with that on the birds. For this purpose he began, in company

with his sons, Victor Gifford and John Woodhouse, who both inherited much of his talent as an artist as well as a naturalist, a new course of travel. But the approach of old age induced his friends to dissuade him from the more toilsome expeditions which he thought necessary to complete this scheme. A great deal of the labor was performed for him by his friend Dr. Bachman, of Charleston, S. C., and he was largely assisted in the other departments by his sons. He died before the work was ended. His sons completed and published the "Quadrupeds of America," in folio and imperial octavo volumes, uniform with the two editions of the "Birds," but died without executing their cherished design of writing a biography of their father. Mrs. Audubon, now (1878) upward of 80 years of age, prepared, with the aid of a friend, a memoir which appeared in New York in 1869, entitled "The Life of John James Audubon the Naturalist," accompanied by a portrait after Henry Inman's well known picture, and a view of Audubon's residence. The work was also published in London. Audubon was a fellow of the Linnean and zoological societies of London, of the natural history society of Paris, of the Wernerian society of Edinburgh, of the lyceum of natural history at New York, and an honorary member of the society of natural history at Manchester, of the royal Scottish academy of painting, sculpture, and architecture, and of many other scientific bodies.

AUENBRUGGER VON AUENBRUG (often called **AVENBRUGGER**), **Leopold**, the inventor of the method of investigating internal diseases by percussion, born in Gratz, Styria, Nov. 19, 1772, died in Vienna, May 18, 1809. He was physician to the Spanish hospital in Vienna, and first made known his discovery in a treatise entitled *Inventum Novum ex Percussione Thoracis Humani Interni Pectoris Morbos Detegendi* (Vienna, 1761), which was translated into French by Rozière (1770), and again by Corviart (1806), and into English by Dr. John Forbes (1824.) (See **AUSCULTATION**.)

AUERBACH, Berthold, a German author, of Jewish parentage, born at Nordstetten in the Black Forest, Feb. 28, 1812. He studied theology and jurisprudence at Tübingen, and philosophy and history at Munich and Berlin. His earliest historical novels treat of Judaism, as *Spinoza* (3 vols., Stuttgart, 1837), and *Dichter und Kaufmann* (3 vols., 1839); and in 1841 he published a German translation of Spinoza's works in 5 vols., with a highly appreciative biographical notice. Subsequently he became celebrated by his descriptions of German village life, remarkable for an abundance of philosophical reflections and poetical feeling, especially by his *Schwarzwälder Dorfgeschichten* (4 vols., 1848-'54; English translation, "Black Forest Village Stories," 1869); his popular political almanac, *Der Gecattemann* (1848-'92, published in *Schatskiste* 1856); *Schrift und Volk*

(1851); and still more by his *Berfamele* (1856; English translation, "Little Barefoot," 1867); *Joseph im Schnee* (1860; English translation, "Joseph in the Snow," 1867); *Edelweiss* (1861; English translation, 1869); *Auf der Höhe* (1865; English translation, "On the Heights," 1868); and *Das Landhaus am Rhein* (1869), of which there are several English translations under the titles of "Villa Eden" and "Villa on the Rhine." The tale, *Die Frau Professorin* (1848; English translation, "The Professor's Lady," new ed., 1871), used by Madame Birch-Pfeiffer in her drama, *Dorf und Stadt*, is regarded as one of his most characteristic works. A number of his tales were published in an English translation in 1869 under the title of "German Stories," and in French in 1858 under that of *Contes d'Auerbach*. There are various other translations from his works in English, French, Dutch, and Swedish. He has also written a tragedy, *Andree Hofer* (Leipzig, 1850), and a drama, *Der Wahlpruch* (1856), but they were not as successful as his tales. His principal political work is *Tagebuch aus Wien* (Breslau, 1849; English translation, "Events in Vienna," London, 1849). Since 1858 he has edited in Berlin a popular almanac, *Deutscher Volks Kalender*, and he chiefly resides in that city. A new edition of his complete works was published in Stuttgart in 1871. During the Franco-German war he accompanied for some time one of the German princes, and wrote letters for a German newspaper.

AUERBACH, Heinrich, a medical professor and senator in Leipzig, born in 1482, died in 1543. His real name was Stromer, but he adopted the name of his native town, Auerbach, in Bavaria, and in 1530 erected a large building in Grimma street, Leipzig, which is still known as the Auerbachshof. Auerbach was a friend of Luther, and when the discussions between the reformer and Eck took place at Leipzig, he offered to his friend the use of his house and table. A principal feature of the Auerbachshof is the cellar in which Luther drank, and out of which, according to popular tradition, Dr. Faust rode upon a barrel, an event illustrated by a painting which still decorates the subterranean walls.

AUERSPERG, Anton Alexander, count (popularly known as **ANASTASIUS GRUF**, his *som de plume*), a German poet, born at Laybach, April 11, 1806. He belongs to an ancient family which originated in Swabia, and subsequently settled in Carniola, where it acquired extensive estates. He early became prominent in the liberal party of Austria, was a member of the Frankfort preliminary parliament, and of the national assembly in the same city (1848), in which he was esteemed eloquent, and took a conspicuous part in the diet of Carniola from 1861 to 1867, after which his ultra-German tendencies made his position in that assembly so unpleasant that he procured his election to the diet of Styria. Since 1861 he has been a

life member of the upper house of the Austrian Reichsrath, and in 1868 he was unanimously chosen first president of the Cisleithan delegation. The degree of doctor of philosophy was conferred upon him in 1865, on occasion of the 500th anniversary of the university of Vienna. He holds a high rank among the lyrical and epic poets of Germany, especially excelling as a humorist and a political satirist. Among his most renowned works are: *Der letzte Ritter* (Stuttgart, 1830; English version by John O. Sargent, New York, 1871), *Spaziergänge eines Wiener Poeten* (Hamburg, 1831), *Schutt* (Leipsic, 1835), and *Gedichte* (1837).

AUERSPERG, Carlos, prince, an Austrian statesman, born May 1, 1814. Though the head of the principal branch of his family, one of the oldest in the empire, he lived in retirement on his estates till the reestablishment of constitutional government by the imperial patent of February, 1861. He was appointed by Schmerling president of the upper chamber of the Vienna Reichsrath, and has since in various capacities, in that assembly and as representative of the Bohemian landed nobility at the diet of Prague, performed a very conspicuous part in defence of the constitutional system against clerical and feudal reaction, of the interests of the German nationality against the Czechs, and of the unity of the empire against federation. He readily accepted, however, the dualistic platform of 1867, and coöperated in establishing and maintaining the new order of things in Austro-Hungary. Early in 1868 he became president of the so-called "citizens' cabinet" in Cisleithan Austria, but the transactions of Count Beust, the imperial chancellor, with the Czechs obliged him to retire in the autumn of the same year. He remained in opposition during the administrations of Count Potocki and Hohenwart, and is now (1873) a zealous supporter of the liberal cabinet headed by his brother Adolph (born July 21, 1821).

AUERSTÄDT, a village of Thuringia, in the Prussian province of Saxony, 10 m. W. of Naumburg, famous for Davoust's great victory over the Prussian army under the duke of Brunswick on the same day on which Napoleon defeated the main army of Frederick William III. at Jena, Oct. 14, 1806. Davoust, with 35,000 men, beat 50,000, and Napoleon made him duke of Auerstädt. (See JENA.)

AUGEAS, or **Augias**, a mythical king of Elis, the cleansing of whose stables was one of the 12 labors of Hercules. (See HERCULES.) When the hero demanded the stipulated reward, Augeas refused to give it to him; whereupon Hercules slew him and all his sons save Phyleus, whom he made king in the room of his father.

AUGER. See BORING.

AUGEREAU, Pierre François Charles, duke of Castiglione, a French soldier, born in 1757, died in June, 1816. At an early age he entered the Neapolitan army, in which he continued a private until he was 30 years old, when he set-

tled at Naples, and gained his livelihood by teaching fencing, until, being suspected of revolutionary principles, he was ordered to quit Italy. Entering the French republican army of the south, he rose rapidly from grade to grade, merely by intrepidity, for he had no military genius. His numerous and contemptible vices made him everywhere hated, but he had great physical courage. In 1794 he was made brigadier general in the army of the eastern Pyrenees, and afterward general of division. On the peace with Spain he was appointed to the army of Italy, and served in all its campaigns under Bonaparte. By his charge at Lodi he decided the victory, and he still more distinguished himself by storming the position of Castiglione (1796). On the overthrow of the directory, on the 18th Fructidor (1797), he expected the succession to one of the expelled directors; but being disappointed, he affected the severe republican, and on Bonaparte's return from Egypt held aloof from him until after the revolution of Brumaire (1798). Shortly after the establishment of the empire he was rewarded with the baton of a marshal, and created duke of Castiglione (1805). He fought bravely in the wars with Austria and Prussia (1805 and 1806), especially at Jena. At Eylau (1807), when so ill that he could hardly sit upright, he compelled his servants to tie him to his saddle, and thus led his column into the fight. Being wounded, however, he was compelled to fall back, his men were thrown into disorder, and Napoleon unjustly sent him home in disgrace. In 1810 he served in Spain, and in 1813 distinguished himself at Leipsic; and when France was invaded in 1814, he was intrusted with the defence of Lyons, which he pledged himself to maintain to the last; but failing through want of means to make good his word, he was again unjustly disgraced. While in retirement at Valence, a proclamation appeared in his name stigmatizing the emperor as "an odious despot, and a mean coward, who knew not how to die as becomes a soldier;" and although the authenticity of the document has been denied by his defenders, Napoleon believed in it. On the way to Elba, Napoleon met his ex-marshal, on the road near Valence; and both descending from their carriages, an interview followed, which terminated in an altercation. Augereau gave in his adhesion to Louis XVIII., received the cross of St. Louis and the command of the 14th division, and was appointed a peer of France. On the return of Napoleon from Elba, he remained inactive until the emperor was actually in Paris, when he would have returned to his party, but Napoleon would not trust him. On the second restoration of the Bourbons, he would again have made his peace with the king; but finding no encouragement, he retired to his seat at La Houssaye, where he died.

AUGIER, Guillaume Victor Émile, a French playwright, born in Valence, Sept. 17, 1820.

He produced his first play, *La ciguë*, in 1844. His comedy *Gabrielle* (1849) placed him at the head of the so-called common-sense school of dramatists. Many of his subsequent comedies were of a lower tone, but more brilliant. Among the most successful are: *Le gendre de M. Poirier* (jointly with M. Sardou, 1855), *Le mariage d'Olympe* (1855), *Les effrontés* (1861), and *Maître Guérin* (1864). He succeeded Salvandy as member of the French academy, Jan. 2, 1858.

AUGITE, a mineral species synonymous with pyroxene; also used by Prof. Dana to designate a section or group of species of the class of anhydrous silicates. (See PYROXENE.)

AUGLAIZE, a W. county of Ohio; area, 899 sq. m.; pop. in 1870, 20,041. The Miami canal and the Dayton and Michigan railroad pass through the county. Near the western bound-

dary is a reservoir 9 m. long, formed to supply the canal, and occupying the most elevated site between the channel of the Ohio river and Lake Erie. It is drained in part by Auglaize river, a tributary of the Maumee at Defiance. The surface is nearly level, well wooded, and the soil is good. In 1870 the county produced 289,756 bushels of wheat, 13,046 of rye, 245,277 of oats, 34,584 of barley, 379,015 of Indian corn, 14,694 tons of hay, 76,650 lbs. of wool, and 246,085 of butter. There were 29,678 sheep and 19,809 hogs. Capital, Wapakoneta.

AUGSBURG, a city of Bavaria, situated between the rivers Wertach and Lech, at their confluence, 83 m. N. W. of Munich; pop. in 1871, 51,284. It is one of the most ancient German cities. Augustus, having conquered the Vindelicans in 12 B. C., established there a colony called Augusta Vindelicorum, on a

Augsburg.

spot, according to some, already inhabited and called Damasia. The Huns destroyed it in the 5th century; and during the wars between Thassilo, duke of Bavaria, and Charlemagne, it suffered much. In 1276, having become rich by trade and industry, the city bought its freedom from the duke of Swabia. Its prosperity increased continually. It was the principal emporium for the trade between northern Europe, the countries on the Mediterranean, and the East, previous to the discovery of America and the doubling of the Cape of Good Hope. Its merchants, including the celebrated Fuggers, possessed vessels on all the seas then known. Its greatest prosperity was toward the end of the 15th and the first part of the 16th century. The arts had here their focus, and the Holbeins and other names known in the history of Ger-

man art belonged to it. After the war against the league of Smalcald the decline of Augsburg began. Here on June 25, 1530, the Protestant princes submitted to Charles V. the confession of their faith, which bears in history the name of the "Confession of Augsburg." In 1555 the religious peace between that emperor and the Protestants was concluded here. At the dissolution of the German empire, Augsburg lost its privileges as a free city, and was incorporated with Bavaria. It is now the capital of the circle of Swabia and Neuburg, and is the seat of various superior administrative, judicial, and clerical boards. In Augsburg is published the *Allgemeine Zeitung*, one of the foremost political and literary journals of the world, issued by the great publishing house of Cotta. The city possesses a large public library, which is increasing daily. The collection of various manu-

scripts, records, and official documents in the archives of the city, is of great importance, chiefly for the history of the reformation. In 1870 there were 10 book-printing establishments, 84 publishing houses, 5 great cotton factories, 74 breweries, and manufactories of gold and silver wares, machinery, paper, &c. Among the new public buildings is a synagogue opened in 1867. Augsburg is a considerable commercial and financial centre, having 24 bankers. The history of the ancient free city is contained in vols. iv. and v. of the *Chroniken der deutschen Städte* (Leipsic, 1865-'7).

AUGSBURG CONFESSION, the first Protestant confession of faith, and the basis of the present faith in Protestant Germany. Charles V., soon after his accession to the throne of Germany, summoned Luther to the diet of Worms (1521), and afterward issued an edict of outlawry against him and his adherents. But the insurrection in Oastile and the war with France and Italy called him away. The edict of outlawry was inefficiently enforced, and the influence of the Lutherans was permitted to increase during the nine years of the emperor's absence. The diet of Spires (1529) had issued a decree for the purpose of conciliating the Lutherans by a proposed Roman Catholic reform, and uniting them against the Sacramentarians and Anabaptists. The Lutherans protested (hence Protestants), and made an unsuccessful effort to unite with Zwingli. At this juncture the emperor returned (1530). The German princes and estates were summoned to convene in diet at Augsburg in June. The summons called for aid against the Turks, making no reference to the religious difficulties of the kingdom, further than to promise at no distant time a speedy adjustment of them. On the 25th of the month a confession, prepared by Melancthon and approved by Luther, was read in the diet. Two days later it was delivered to the Roman Catholic theologians for a reply. This was read in the diet on the 3d of August following, and called forth from Melancthon a defence (*Apologia Confessionis*), which was afterward enlarged and published in Latin, and then in German. The object of the Augsburg Confession was not attained, and the edict of the emperor (Sept. 22) gave the Lutherans until the following April to bring themselves into conformity with the requirements of the church, and demanded their cooperation with the throne against the Zwinglians and Anabaptists. The Augsburg Confession and Melancthon's defence were generally circulated in western Europe, and became a rallying point among the reformers. About 1540 Melancthon made some important changes in the Confession. This form, known as the *Confessio variata* (the "altered Confession"), was received until 1580, when the *Confessio invariata* (the "unaltered Confession") was formally adopted as the standard of the Lutheran churches.—The Augsburg Confession comprises two parts, besides the appended *Apologia*, or defence. Part I. com-

prises 21 articles, of the contents of which the following is an abstract: 1 treats of God and the Trinity, in accordance with the Nicene creed; 2 asserts that all men since the fall are born with sin; 3 treats of the person and mediation of Christ, in accordance with the Apostles' creed. 4. Justification is the effect of faith, exclusive of good works. 5. The Word of God and the sacraments are the means of conveying the Holy Spirit, but never without faith. 6. Faith must produce good works, but not to merit justification. 7. The true church consists only of the godly. 8. Sacraments are valid though the administrators are evil. 9. Infant baptism is necessary. 10. The real presence in the eucharist exists only during the period of receiving; the sacrament to be received in both kinds. 11. Absolution is necessary, but not particular confession. 12 is against the Anabaptists. 13. All who receive the sacraments must have actual faith. 14. No one can teach in the church or administer the sacraments without having been lawfully called. 15. Holy days and church ceremonies to be observed. 16. Of civil matters and marriage. 17. Of the resurrection, last judgment, heaven, and hell. 18. Of free will. 19. God is not the author of sin. 20. Good works are not wholly unprofitable. 21 forbids the invocation of saints. Part II. comprises seven articles: 1 enjoins communion in both kinds, and forbids the carrying out of the sacramental elements; 2 condemns the law for the celibacy of priests; 3 condemns private masses, and directs that some of the congregation shall always communicate with the priest; 4 denies the necessity of auricular confession; 5 is against tradition and human ceremonies; 6 condemns monastic vows; 7 discriminates between civil and religious power, the power of the church consisting only in preaching and administering the sacraments. The *Apologia* consists of 16 articles, treating of original sin, justification by faith, fulfilment of the law, penitence, repentance, confession, satisfaction, sacraments, ordinances, invocation of saints, communion in both kinds, celibacy, monastic vows, and ecclesiastical jurisdiction.—Gieseler's "Church History," edited by Prof. H. B. Smith, vol. iv., p. 432 (New York, 1861), furnishes a summary of documents relating to the Augsburg Confession.

AUGUR, Ezekiah, an American sculptor, born in New Haven, Conn., Feb. 21, 1791, died there, Jan. 10, 1858. In early life he produced several works of statuary, of which his "Jephthah and his Daughter," in the Trumbull gallery of Yale college, is the best. In addition to his skill as a sculptor, he possessed much mechanical genius. His most celebrated achievement is his invention of the carving machine, which is at the present day in general and successful operation.

AUGURS, diviners among the Romans. The practice of divination flourished in Chaldea and Egypt; from the latter country it passed to Greece, whence the Romans received it.

In Greece and Rome astrology proper ceased to have the importance in augury which it had maintained in Chaldea, while, as the word augury (*avigerium*) itself would indicate, the preëminence had been given to omens taken from the flight of birds. Both among the Greeks and Romans much of the art of augury depended on the cardinal points of the compass. The Greek augurs always faced the north, while the Roman augurs faced the south. Omens in the east were generally lucky, while those in the west were unlucky. Hence the Greek had his right hand synonymous with good fortune, the Roman originally his left. Later in Roman history, however, *sinister* (left) became a synonyme for bad fortune, and *dexter* (right) for good. Auguries were made both from the flight and cries of birds. Lightning was also observed by the augurs, as well as other striking phenomena, such as meteora, winds, and eclipses. The direction in which a bird flew, the crowing of a cock, the line of the electric flash, and the manner in which a cooped chicken picked his corn, were prominent augural elements. Some even more trivial and accidental occurrences were reckoned ominous, such as an animal crossing one's path, a fit of sneezing or sudden melancholy, the spilling of salt on the table, or of wine upon one's clothes. The power of the Greek and Roman augurs was very great. They held their offices for life, regardless of character. In Rome they were at first three in number, and were chosen one from each of the three tribes of the patricians. They were elected by the *comitia curiata*, a patrician assembly, until the Ogulnian law (300 B. C.) admitted the plebeians and enlarged the number of augurs, then four, to nine, subsequently increased to 15. Every election had to be ratified by the college itself. This original power of veto afterward resulted in the usurpation by the college of the right to elect its own members by coëptation (452 B. C.), which right they retained, with the exception of the first election of plebeian augurs, for 348 years, until the passage of the Domitian law (104), which removed the power of election to the tribes. The most authoritative enactments of the *comitia* were repeatedly annulled by the entrance of an augur into the assembly, pronouncing the words *Alio die* ("On another day"). The order of augurs gradually declined after the admission of the plebeian element, until it was abolished, with paganism in general, by Theodosius the Great, about A. D. 390.

AUGUST, the 8th month of the year, derived from the Roman calendar. The Romans called it originally Sextilis, or the 6th month of their year, which began with March. Julius Cæsar made it 80 days in length, and Augustus increased it to 31. As it was the month in which Augustus Cæsar had entered upon his first consulship, had celebrated three triumphs in the city, had received the allegiance of the

soldiers who occupied the Janiculum, had subdued Egypt, and put an end to civil war, the senate, in order to flatter him, changed the name of the month to Augustus, in the same way that Quinctilis had been changed to Julius under Julius Cæsar. The Flemings and Germans have adopted the word August to signify harvest. Thus *oogst maend* (Flemish) is the harvest month; so the German *Augst-wagen*, a harvest wagon; and the Dutch *oogsten*, to gather corn from the field. The Spaniards use the verb *agostar*, to gather in harvest; and the French and Spaniards have the phrases *faire l'août* and *hacer su agosto*, to signify harvesting. The Saxons in Britain named August the weed month. The old Germans named it *Weinkoch*, the wine-press month.

AUGUST FRIEDRICH EBERHARD, prince of Württemberg, uncle of King Charles I., a Prussian general of cavalry, born Jan. 24, 1813. He entered the Prussian service in 1830, became in 1858 commanding general of the Prussian guards, and took part in the wars against Austria (1866) and France (1870), favorable mention of his name being made in the reports of the battles of Gravelotte and Sedan.

AUGUST WILHELM, prince of Prussia, brother of Frederick the Great, and general of the Prussian army, born in Berlin in 1722, died in 1758. He took an active part in the Silesian campaigns, and distinguished himself at the battle of Hohenfriedberg (June, 1745); but in the seven years' war, owing to the fatal retreat of Zittau in 1756, he incurred the displeasure of his brother, and withdrew from the army. This conflict between the two brothers led to a correspondence, which was published in 1769.

AUGUSTA, a N. W. county of Virginia, bordering on West Virginia and the Blue Ridge; area, 900 sq. m.; pop. in 1870, 28,763, of whom 6,737 were colored. It was distinguished for its loyalty to the revolutionary cause, for which it was commended by Washington. The surface is elevated and uneven; the soil, which is drained by the sources of the Shenandoah and James rivers, is calcareous, and one of the most fertile in the state. In 1870 the county produced 463,276 bushels of wheat, 29,835 of rye, 280,380 of Indian corn, 234,492 of oats, 19,671 tons of hay, 23,291 lbs. of wool, and 353,335 of butter. The quantity of hay was greater than in any other county of the state, and of wheat and butter than in any other except Loudon. Extensive beds of anthracite coal have been opened. The celebrated Wyer's or Wier's cave, Madison cave, and the Chimneys are in this county. Capital, Staunton.

AUGUSTA, a city of Maine, capital of the state and of Kennebec county, situated at the head of sloop navigation on the Kennebec river, 43 m. from its mouth, 63 m. by railroad N. N. E. of Portland, 72 m. S. W. of Bangor, and 171 m. N. N. E. of Boston; pop. in 1860, 7,609; in 1870, 7,808. The city lies on both sides of the

river, which is spanned by a bridge 520 ft. long. It is well laid out, and has many handsome buildings and a great abundance of shade trees and shrubbery. The state house, built of white granite, is considered the handsomest in New England except that of Montpelier, Vt.; the court house is the best and most convenient in the state; and the Maine insane asylum is a splendid granite structure, overlooking a landscape of peculiar beauty. The United States arsenal is on the E. side of the river. Just above the city a dam 1,000 ft. long provides an immense water power, while canals at each end render the river navigable N. of Augusta. The Maine Central railroad (Augusta division) runs through the city. There are 8 churches, 7 hotels, 5 newspapers (1 daily and 4 weekly), 3 banks, and 2 savings institutions. Lumber forms the chief manufacturing interest. An extensive cotton factory has recently been erected here.

AUGUSTA, a city of Georgia, capital of Richmond county, at the head of navigation on the Savannah river, 132 m. by railroad N. N. W. of the city of Savannah, and 137 m. N. W. of Charleston, S. C.; pop. in 1860, 12,493, of whom 4,049 were colored; in 1870, 15,386, of whom 6,390 were colored. It was laid out in 1735, and became an important point in military operations during the revolutionary war, being alternately in the possession of the royal troops and the Americans. The city was incorporated in 1798, and the chief magistrate bore the appellation of intendant until 1818, when the first mayor was elected. The city is very handsomely laid out on an extended plain on the W. bank of the Savannah river, with wide streets crossing each other at right angles. The principal business thoroughfare, Broad street, is 2 m. long and 165 ft. wide. Greene street, the most beautiful in the city, is 168 ft. wide, and has a row of stately shade trees on either side along its entire length. The principal buildings are the city hall, masonic hall, odd fellows' hall, and the opera house. The city hall was completed in 1824 at a cost of \$100,000. In front of it stands a granite monument 45 ft. high, erected by the city in 1849 to the memory of Hall, Gwinnett, and Walton, signers of the Declaration of Independence. An orphan asylum, 178 ft. by 78, is building at a cost of \$150,000. The medical college of Georgia, situated here, in 1868 had 8 professors, 97 students, and a library of 4,000 volumes. The city water works were completed at a heavy cost in 1861. The water is drawn from the canal and forced into a tank holding 185,000 gallons in a cylindrical brick tower standing 115 ft. above the general level of the city. The Augusta canal, 9 m. long, brings the waters of the Savannah river near the city, some 40 ft. above the level, and thus affords inexhaustible power for factories. Chief among these is the "Augusta Factory," with 508 looms, employing 500 hands and producing in 1871 8,527,728 yards of cloth. There are 5

extensive flouring mills, which in 1871 consumed about 409,000 bushels of corn and wheat. In 1871 the city contained 6 banks, 4 foundries (besides the extensive foundry and machine shops of the Georgia railroad), 2 tobacco factories, 4 hotels, 21 churches (8 of which are for colored people), 2 academies, an arsenal, several hospitals, and many benevolent societies. There were 700 white and 500 colored pupils enrolled in the public schools. There are 2 daily newspapers, 2 weekly, 1 semi-monthly, and 1 monthly published here. In 1869 the assessed value of real estate, exclusive of the Augusta factory property, was \$6,300,000, and in 1871, \$6,593,420. For the year ending April 1, 1869, the sales of cotton amounted to \$8,246,867, and for the year ending April 1, 1871, \$11,575,846. The bonded debt of the city on Jan. 1, 1871, was \$1,355,250, while the assets amounted to \$1,802,610. Augusta has railroad communication with all the leading markets of the country. The Central railroad extends from Augusta to Savannah and Macon; the Charlotte, Columbia, and Augusta, from Augusta to Charlotte, N. C., via Columbia, S. C., being an important link in the great short passenger route between New York and New Orleans; the main line of the Georgia railroad extends from Augusta to Atlanta, with branches to Washington, Warrenton, and Athens. The Macon and Augusta railroad affords connection with the former city, and the South Carolina railroad connects Augusta with Charleston, Columbia, and Camden, and with the Wilmington and Manchester railroad at Kingville. Several other railroads are projected, the most important of which is the Port Royal railroad to Port Royal, S. C., a distance of 110 m., which will give Augusta a shorter route to the seaboard.—The arsenal at Augusta was seized by the confederate authorities Jan. 24, 1861.

AUGUSTA, John, a Bohemian theologian, born in Prague in 1500, died Jan. 13, 1575. He studied theology at the school of Wacław Koranda. On the death of this master Augusta went to Wittenberg, and entered into close communion with Luther and Melancthon. He became later bishop of the Bohemian Brethren, brought about an agreement between that sect and the Protestants, and induced the Brethren to refuse their coöperation to Ferdinand I. in the Smalcaldic war against the Protestants; a contumacy which Ferdinand avenged after the war was over by banishing the whole sect and arresting the principal preachers. Augusta, who had attempted to escape in the garb of a peasant, was taken in chains to Prague, and thrown into prison. He was offered his liberty on condition of making public recantation and becoming either a Catholic or a Utraquist. He was ready to profess himself a Utraquist, but not to recant in public, and he accordingly remained in prison 16 years. The death of Ferdinand (1564) released him, but he was obliged to promise not to preach again.

AUGUSTA HISTORIA, the name given to a series of Roman biographers of the emperors from the accession of Hadrian (117) to the death of Carinus (385), the predecessor of Diocletian. The writers included in this collection are *Ælius* Spartianus, Julius Capitolinus, *Ælius* Lampridius, Valerius Gallicanus, Trebellius Pollio, and Flavius Vopiscus of Syracuse. Some editors have included others, as Eutropius and Paulus Diaconus. There is a break in the *Augusta Historia* in the absence of the lives of Philippus, Decius, and Gallus. The Bipontine edition is the best.

AUGUSTA, *Maria Louisa Catharine*, empress of Germany and queen of Prussia, born in Weimar, Sept. 30, 1811. She is the daughter of the grand duke Charles Frederick of Saxe-Weimar (died July 8, 1853), and her mother (died June 23, 1859) was a daughter of Paul I., emperor of Russia. She was brought up at the court of her grandfather Charles Augustus, the friend of Goethe, who speaks in one of his letters of the "many-sided and harmonious culture of the princess Augusta." Her elder sister Maria married Prince Charles of Prussia, and she married the prince's brother, the present Emperor William, June 11, 1829. She attended personally to the education of her two children, the present crown prince and the princess Louisa, since 1856 grand duchess of Baden. She is much respected for her love of science, letters, and art, and for her benevolent disposition, displayed especially in 1870-'71 in labors for the relief of the wounded soldiers. In 1872 she founded at Charlottenburg a seminary for the education of orphan daughters of officers who fell in the war, and has designed buildings for the poor in Berlin after the plan of those of Mr. Peabody in London.

AUGUSTAN AGE, the Roman literary epoch which culminated in the reign of Augustus Cæsar. During this period Cicero, Horace, Ovid, Virgil, Catullus, Tibullus, and other writers flourished; also great patrons of literature like Mæcenæas. The purest Latinity belongs to the authors of the Augustan age. In English literature it was common in the last century to apply the phrase "Augustan age of English literature" to the times of Addison, Steele, Swift, and Defoe, and the writers during the reign of Queen Anne. The *siècle d'Auguste* of French literature is the latter years of the reign of Louis XIV. This metaphor has no modern application beyond the literature of France and England.

AUGUSTENBURG, a village on the formerly Danish and now German island of Alsens; pop. about 500. It grew up round the palace of the same name, built in 1651 by Duke Ernst Gunther, and rebuilt in the latter part of the 18th century on a magnificent scale by Friedrich Christian the elder, duke of Schleswig-Holstein-Sonderburg-Augustenburg, whose son Christian August (born July 9, 1768, died May 28, 1810) was in 1810 adopted by the childless King Charles XIII. of Sweden, and was suc-

ceeded by Bernadotte as crown prince. The male lineage of the ancient royal Holstein-Denmark dynasty became extinct in 1863, and its female lineage has since been known as the Holstein-Sonderburg family, the present king of Denmark belonging to the junior or Schleswig-Holstein-Sonderburg-Glücksburg branch, and the dukes of Augustenburg to the senior or Schleswig-Holstein-Sonderburg-Augustenburg branch. Prominent among the latter was Christian Karl Friedrich August (born July 19, 1798, died March 11, 1869). His father was the duke Friedrich Christian the younger, and his mother was a daughter of Christian VII. of Denmark. He sold his hereditary estates to Denmark in 1852, and in 1863 relinquished his claims to the succession in the duchies of Schleswig and Holstein, which were unsuccessfully revived during the Schleswig-Holstein war by his elder son Friedrich Christian August (born July 6, 1829), who has since the annexation of his former possessions to Prussia chiefly resided in Gotha. His eldest son, August, was born in 1858.

AUGUSTI, *Johann Christian Wilhelm*, a German theologian, born at Eschenberg, in Gotha, about 1772, died in Coblenz in 1841. He studied at Jena, became professor of philosophy and oriental languages in that university, was appointed professor of theology in 1812 at Breslau and in 1819 at Bonn, and some years later was placed at the head of the ecclesiastical affairs of the Rhenish province of Prussia as director of the consistory of Coblenz. The most important of his numerous works is the *Denkwürdigkeiten aus der christlichen Archæologie* (12 vols. 8vo, Leipsic, 1817-'31). As an oriental scholar he was eminent. In doctrine he was an orthodox Lutheran.

AUGUSTIN, or *Austin*, *Saint*, archbishop of Canterbury, sometimes called the apostle of the English, born probably in the first half of the 6th century, died at Canterbury between 604 and 614. He was a Benedictine monk in the monastery of St. Andrew at Rome, when he was selected by Pope Gregory I. with other monks to convert the Saxons of England to Christianity. He landed in the dominions of Ethelbert, king of Kent, in 596 or 597, and was hospitably received and allowed to preach to the people, although the king himself firmly refused to forsake the gods of his fathers. The influence of his wife, a Christian princess, aided by the preaching of Augustin, finally prevailed, and Ethelbert was baptized, after which the efforts of the missionaries were crowned with complete success throughout the whole Saxon heptarchy. The ascetic habits of Augustin and his brethren, a reputation for miraculous power in the restoration of sight and even of life, the example of the king, and the fact that the southern races of Europe which had embraced Christianity were far before them in civilization and prosperity, made a deep impression upon the Saxon people, never very devotedly attached to their national religion,

and their conversion seems to have been general; it is said that 10,000 persons were baptized in a single day. Their temples were dedicated to the new faith and used as churches, and many of their rude festivals were converted into religious feasts, without losing their original social character. Augustin, it is said, allowed no coercive measures to be used in propagating the gospel. His success caused him to be appointed by the pope archbishop of Canterbury, with supreme authority over the churches of England. The see of York was soon afterward established, and a number of other bishoprics. Augustin wished to establish conformity of religious customs over the whole of Britain, and for that purpose appointed several conferences with the British bishops of Wales, who were successors of converts of the 2d century, and had declared their independence of the church of Rome. The conferences, however, failed of any result. A number of Welsh monks were soon after put to death, and Augustin has been charged with the deed, but on no very good authority. His relics were preserved in the cathedral at Canterbury.

AUGUSTINE (AURELIUS AUGUSTINUS), *Saint*, a doctor of the Latin church, born at Tagaste, a small town of Numidia in Africa, not far from Carthage, Nov. 13, 354, died Aug. 28, 430. His father, Patricius, was a pagan nobleman of moderate fortune, while his mother, Monica, who has been canonized by the church, was an earnest Christian. Augustine was sent to the best schools of Madaura and Carthage. His own "Confessions" tell us that his conduct at this period of his life was far from exemplary. His studies, chiefly in the heathen poets, were more favorable to the development of his fancy and his style than to his Christian growth. The death of his father, which threw him upon his own resources, and the influence of some philosophical works, especially the *Hortensius* of Cicero, roused him to a diligent search after truth. Unable to find this in the writings of the Greek and Roman sages, and dissatisfied with what seemed to him the crude and fragmentary teachings of the Jewish and Christian Scriptures, he adopted the dualism of the Manichæans. At the age of 29 he went to Rome. There his reputation as a teacher of eloquence soon rivalled that of Symmachus, then at the height of his renown. On the recommendation of that orator, he was called to Milan as a teacher of rhetoric. Ambrose was then bishop of Milan, and Augustine's first care was to know so famous a preacher. After repeated interviews with Ambrose, the conversion of his own illegitimate son, and the entreaties of his mother, he resolved to embrace Christianity. The history of his conversion forms the most striking chapter in his "Confessions." After eight months of seclusion, which he spent with his mother and brother and son, preparing for his confirmation in the church, and maturing his plans for the future, Augustine in the Easter week

of 387 was baptized, together with his son and brother, by the hand of Ambrose. He at once set out on his return to Africa. On the way his mother died, and a small chapel among the ruins of Ostia marks the traditional spot of her burial. The death of his son, which took place soon after his return, confirmed his inclination to the monastic life. He retired to Tagaste, and passed nearly three years in studious seclusion, varied only by occasional visits to the neighboring towns. On one of these visits, when he was present at the church in Hippo, a sermon which the bishop Valerius delivered, asking for a priest to assist him in his church, turned all eyes toward this famous scholar. No refusals were allowed, and Augustine was ordained. Preaching was soon added to his duties, an exception being made in his case to the usual rule, and the periods of the African orator, in harsh Latin or the harsher Punic tongue, were received with vehement applause. He was soon called to be assistant bishop, and then, on the death of the elder prelate, the whole charge of the church of Hippo was intrusted to his care. He retained the office until his death, a period of 35 years. The details of his episcopal life are minutely related by his friend Possidius. He preached every day and sometimes twice in the day; was frugal in his domestic arrangements, being a strict ascetic, and requiring of his attendant priests and deacons an equal simplicity of diet and dress; given to hospitality, yet without display; warmly interested in every kind of charity; courteous in his bearing, welcoming even infidels to his table; bold against all wickedness and wrong, whatever the rank of the transgressor; and untiring in his visits to widows and orphans, to the sick and the afflicted. He disputed with Manichæans, Arians, the followers of Priscillian, of Origen, and Tertullian, the Donatists, and the Pelagians, and allowed no doubtful utterance of doctrine to pass without his questioning. To his industry in controversy must be added his vast correspondence with emperors, nobles, doctors, missionaries, bishops, in every quarter of the globe, on questions of dogma, of discipline, and of policy—his solid works of commentary, criticism, morality, philosophy, and theology, and even his poetry, for to him are attributed several of the sweetest hymns of the Catholic anthology. The titles alone of the works of Augustine make a long catalogue. The single volume of "Sermons" contains nearly 700 pieces, shorter indeed and less ornate than the celebrated sermons of Basil and Chrysostom, but justifying Augustine's reputation for sacred oratory. The volume of "Commentaries on the Psalms" is more rich in practical remarks than in accurate learning. His remarks upon the "Four Gospels" are more valuable. His work on the "Care that should be taken for the Dead" contains some striking views concerning the relation of the living to disembodied souls. The volume of his "Epi-

ties" is remarkable, as illustrating his best style and the finest traits in his character. The name of Augustine, in the dogmatic history of the church, is best known in connection with the heresy of Pelagius; but his works which are most widely known are the "Confessions" and "The City of God." In the former, written just after his conversion, he gives a history of his life up to that time, not so much in its outward circumstance as in its inward experience and change. It has been translated into every Christian tongue, and is classed with the choicest memorials of devotion, both in Catholic and Protestant oratories. His treatise on "The City of God" (*De Civitate Dei*) is the monument of highest genius in the ancient church, and in its kind has never been surpassed. Its immediate purpose was to vindicate the faith of the gospel against the pagans, who had just devastated Rome. The first five books confute the heathen thesis that the worship of the ancient gods is essential to human prosperity, and that miseries have only come since the decline of this worship. The five following books refute those who maintain that the worship of pagan deities is useful for the spiritual life. The remaining twelve books are employed in setting forth the doctrines of the Christian religion, under the somewhat fanciful form of "two cities," the city of the world and the city of God. The influence of Augustine upon his own age, and upon all succeeding ages of Christian history, cannot be exaggerated. It is believed that he was at once one of the purest, the wisest, and the holiest of men; he was equally mild and firm, prudent and fearless; at once a philosopher and a mystic, a student and a ruler. Of his singular humility manifold instances are recorded. His severe self-discipline matches the strictest instances of the hermit life. In his "Retractions," begun after the close of his 70th year, he reviews his writings, taking back whatever is doubtful or extravagant, and harmonizing discordant opinions. The aid of a coadjutor relieved Augustine in his latter years of a portion of his responsibility; yet questions of conscience were constantly presented to him. When Genseric and his Vandals showed themselves on the coasts of Africa, the question was put to him if it were lawful for a bishop at such a season to fly and leave his flock. The answer which he made was illustrated by his own course. He calmly waited for the threatened approach, and when the fleet of the foe was in the bay of Hippo, and the army was encamped before the walls, exerted himself only to quiet the fears and sustain the faith of his brethren. He died of fever before the catastrophe. The bishop Possidius, who watched at his bedside, gives an edifying account of his last days, and of the grief of the people at his loss. His relics were transported to Italy, and mostly rest at present in the cathedral of Pavia. Within the present century the bone of his right arm has, with solemn pomp, been returned to the church of

Bona in Algeria, which occupies the site of ancient Hippo.—The best edition of Augustine's works is that of the Benedictines, published at Paris and at Antwerp at the close of the 17th century, in 11 vols. folio. An edition in 11 volumes was also published in Paris in 1836-'9. An additional volume of sermons, before unpublished, found at Monte Casino and Florence, was published at Paris in 1842. An English translation by various hands has been undertaken at Edinburgh, under the editorship of the Rev. Marcus Dods, the 3d and 4th volumes of which appeared in 1872.

AUGUSTINIANS, or Hermits of St. Augustine, a religious order in the Roman Catholic church, which traces its origin to the great bishop of Hippo, and professes to have received its rule from him, although many Catholic writers dispute the fact. St. Augustine in the year 388, before his ordination, erected a kind of hermitage on a little farm belonging to himself near Tagaste, where with several friends he passed his time in seclusion. After he became a priest at Hippo he established a similar retreat in a garden presented to him by the bishop, and during his episcopate he had his clergy living with him in his house, under a kind of monastic rule. From these circumstances he has been looked upon as the founder and special patron of a certain class of religious communities, and many of their rules have been drawn from his writings. The present order of Hermits of St. Augustine was formed by uniting several societies previously distinct. This was done by Alexander IV. in the year 1256, and a rule was given them attributed to St. Augustine. In 1567 the Augustinians were enrolled among the mendicant orders. In England they were usually called Black Friars, from the color of their habit. There are several distinct branches of Augustinians whose rule is more severe than that of the principal body; they are governed by vicars general, who are subordinate to the general. Rome is the chief seat of the order. The number of convents in 1862 was 271, with about 4,000 members; but since then their number has been greatly reduced by the suppression of monastic orders in Italy. There is a large and beautiful church belonging to the Augustinians, with a convent adjoining, in Philadelphia; also a college, with a monastery and a well cultivated farm adjoining, at Villanova, Delaware county, Pa., about 15 m. from Philadelphia.—**Augustinian Canons** are a separate body of canons regular attached to the Lateran basilica and a few other churches.—Several religious orders of females belong also to the Augustinian family.

AUGUSTOWO. I. Formerly the N. E. government of the Russian kingdom of Poland. Its territory now forms the government of Suwalki and a part of Lomza. II. A city in the present government of Suwalki, from which the preceding government received its name, on a tributary of the Narew, near a considerable lake, and 140 m. N. E. of Warsaw; pop. in 1867,

9,864. It has an extensive trade in cattle and woollen and cotton goods. It was founded in 1560 by King Sigismund Augustus, from whom it was named.—The canal of Augustowo connects the Narew with the Niemen, making a continuous navigation between the upper Vistula and the mouth of the Niemen in the Baltic. It is 150 m. long and 5 to 6 ft. deep.

AUGUSTULUS, *Romulus*, the last Roman emperor of the West. He was placed on the throne A. D. 475, by his father Orestes, a native of Pannonia, who had been a favorite of the emperor Julius Nepos, but who at last succeeded in usurping the power of his patron, and conferring it upon his son. The young man was remarkable only for his weakness and the beauty of his person. On the defeat of Orestes by Odoacer at Pavia, and his subsequent execution (476), Augustulus was banished to the castle of Lucullus in Campania, where he received yearly 8,000 pieces of gold.

AUGUSTUS, *Caius Julius Cæsar Octavianus* (named at his birth simply Caius Octavius), first emperor of Rome, born at Velltræ, Sept. 23, 68 B. C., died at Nola, Aug. 19, A. D. 14. He was the son of Caius Octavius, a rich senator, who in 60 B. C. was appointed prætor of Macedonia, and of Atia, a daughter of Julia, the younger sister of Julius Cæsar. His father dying just after retiring from his prætorship, Octavius was educated in Rome at the wish of his mother, and afterward under the superintendence of Lucius Marcius Philippus, who became his stepfather. He soon attracted the notice of his great-uncle Julius Cæsar, who treated him as his own son, and by his will made him his principal heir. On March 15, 44, when the dictator was assassinated at Rome, Octavius was at Apollonia on the W. coast of Epirus Nova, pursuing his studies. The news of the murder and of his own adoption as heir reached him almost immediately. Against the warning of friends, he went at once to Rome, changing his name Octavius to Octavianus, and demanded his inheritance, which Mark Antony, who had possessed himself of the principal power in the state, after some hesitation was obliged to yield. Octavius, who was now universally known by the name of Cæsar, began a struggle with Antony for the control of Rome. Each tried every means to gain the favor of the people. Octavius was already beginning to gain the advantage, when Antony left Rome to secure for himself the legions in Cisalpine Gaul. Octavius took advantage of his rival's absence to win still further the popular favor, and was aided by the refusal of Decimus Brutus, prætor in Cisalpine Gaul, to give up that province to Antony. Cicero now came forward in Octavius's favor, thinking thus to advance the cause of a freer government. The senate, the people, and the soldiers were soon won. In January, 43, having received the rank of prætor and been appointed to the command of those troops whose good will he had secured, he went with the two consuls to the as-

sistance of Decimus Brutus, whom Antony was besieging in Mutina (Modena). Antony was defeated and driven beyond the Alps. But the senate, dreading any increase of the power of Antony, now made a change of policy, appointed Decimus Brutus to the chief command of the army, and denied Octavius a triumph. The latter thereupon began to treat with Antony for a reconciliation and division of power, Antony having in the mean time allied himself with Lepidus and recrossed the Alps. First of all Octavius secured the consulship, which the senate was persuaded almost against its will to permit him to assume. He paid the people the sums left by the will of Cæsar, and secured for himself the command of an army to be sent against Brutus and Cassius, against whom a decree of outlawry was passed. Under the guise of moving first against Antony, Octavius marched his army into northern Italy and met Antony and Lepidus at Bononia (Bologna). Here an open reconciliation took place, and he formed with them the triumvirate, agreeing to merge his own power in this equal division of the empire among the three. The triumvirs returned to Rome immediately, though they entered the city separately. In the general proscription and massacre of their enemies which followed, Octavius displayed cruelty fully equal to that of his associates. After an unsuccessful attempt to take Sicily from Sextus Pompey, who had an excellent fleet, and with whom many Romans took refuge, Octavius and Antony turned their arms against Brutus and Cassius, whom they defeated at Philippi (42). On his return to Rome—Antony now being with Cleopatra in Egypt—Octavius found that Fulvia, Antony's wife, aided by Antony's brother, Lucius Antonius, had endeavored to excite popular feeling against him by declaring that a new proscription was about to begin, and by other means. Antonius had even assembled an army. Octavius put a speedy end to this revolt by taking Perugia (Perugia), where Lucius Antonius had fortified himself, and cruelly putting to death 400 Perusians as a sacrifice to the manes of Cæsar (40). Fulvia's death prevented a renewal of the war, and Octavius and Antony were reconciled at Brundisium, Octavia, Octavius's sister, being given in marriage to his fellow triumvir. Sextus Pompey, however, still held Sicily, the grain storehouse of Rome, and Octavius was obliged to bribe him by the offer of Sicily, Sardinia, Corsica, and the province of Achaia, to make peace and supply Rome with food. No sooner had Octavius thus secured Pompey than he began to seek for a pretext to recapture the provinces given him. Alleging that Pompey allowed piracy near his coasts, Octavius declared war against him (38). Antony at first refused his aid, but was persuaded by the mediation of Octavia, and sent a considerable fleet to join that of Octavius. After some vicissitudes, Agrippa, the commander of the navy, ended

the war by an overwhelming defeat of Pompey, who fled to Asia (36). Lepidus, the only one of the triumvirs who had actually succeeded in landing in Sicily, now aspired to the government of that island; but Octavius won over his troops, and he suffered himself to be called to Rome and consigned to submissive quiet by the appointment of pontifex maximus. Octavius now divided among his soldiers the lands taken from his enemies. He was received with the greatest honors at Rome, but, with his wonted hypocrisy, assumed a modest and liberal mien; he improved the city, and even talked of fully restoring the republican forms. But while gaining for himself the favor of the people, he steadily undermined the influence of his only remaining rival, Antony, whom he pretended to support. Much of his time in the two years that followed (35-34) was occupied in the suppression of revolts in various parts of the Roman provinces. The repudiation by Antony of his wife Octavia served to widen the breach between the triumvirs; and soon afterward the arrogant and dangerous assumptions of Cleopatra, who now held Antony as her complete slave, afforded Octavius the pretext he desired. Convincing the people of the dangerous designs of the Egyptian queen, he brought about a declaration of war, defeated her and Antony in the battle of Actium in September, 31, rapidly followed up this victory, and by the succeeding events, ending in the death of this only remaining opponent (30), he was left sole ruler of Rome, and celebrated his victories by a three days' triumph. He had some thought of laying aside his power, but in counsel with his friends Agrippa and Mæcenæ, the advice of the latter prevailed, probably coinciding more nearly with his own wishes, and he kept his rulership. Rome was now in complete peace. Octavius, although himself supreme, reestablished many of the old republican forms, and benefited the city by numerous wise measures. In his seventh consulship (27), he astonished the senate by proposing to lay down the chief power and to restore entirely the old order of things. The senators begged him to retain his position, and he, pretending great reluctance, consented. This ruse was several times repeated during his life. On Jan. 16, 27, he received from the Roman people and the senate the name Augustus (the venerated or sanctified), and by this title he was generally known from this time forth. Within the next few years the powers of tribune, pontifex maximus, and of many other magistrates, were gradually assumed by Augustus, with the consent of the senate, and he became finally the absolute ruler of the empire. In 26 and 25 he established order in Spain, defeating the rebellious Astures and Cantabri, who, however, afterward revolted, and were not finally subdued till 19. In 21, after four years spent at Rome, during which several conspiracies had been discovered against his life, he visited Sicily and the eastern part

of the empire, establishing order everywhere. He left Agrippa, who married his daughter Julia, as governor of Rome in his absence. During this journey he visited Athens and Samos. In 20 he made a treaty with the Parthians, by which they peacefully restored standards and captives taken from Crassus (53) and Antony (36). In 16 he went to Gaul, where he remained three years, and established many colonies. Agrippa died in 12, leaving two sons, who had been adopted by Augustus and called Caius and Lucius Cæsar. Within the year Julia was married again to her stepbrother Tiberius, the son of the crafty Livia, who in this year also was sent against the Pannonians and defeated them. In 10 Augustus went again to Gaul, and at the same time sent his stepson Drusus, the younger brother of Tiberius, against the western German tribes. Drusus conquered them, but was killed by an accident, and Augustus pronounced his funeral oration in the senate (9). In 8 B. C. the senate flattered Augustus on his victories by naming after him the month of August, before called Sextilis. A short time after this Augustus sent into exile his daughter Julia, whose dissolute life had become an open scandal. Her two sons had now assumed the *toga virilis*, and were looked upon as the heirs of the emperor. But Lucius died at Massilia in A. D. 2, and Caius in Lycia in 4; and Augustus, upon whom these family misfortunes made a deep impression, adopted Tiberius, thus fulfilling the desire of Livia, and sent him to conduct a campaign against the Germans. Tiberius was victorious, but in the year 9 the overwhelming defeat of the Roman general Varus by Arminius lessened the value of these conquests. A period of peace now followed, and Augustus turned his attention to the affairs of the city, which he administered wisely and with the popular favor. In 14 his health suddenly declined, and just after taking the census, the third during his administration, he died at Nola, whither he had gone on account of his illness.—The period of Augustus is one of the most important in Roman history. In it flourished those men who have caused it to be named the "Augustan age of literature"—Catullus, Cicero, Virgil, Horace, Ovid, Tibullus, the great patron of art and letters Mæcenæ, and others. Augustus himself wrote several works, of which only fragments remain. These have been collected, and a good edition of them was published by Weichert (Grimm, 1841). The emperor's rule was most beneficial to the city. He boasted that he had found it of brick and left it of marble. He encouraged all useful arts, and his laws in matters of municipal government were generally admirable. In person Augustus was of middle height, with a well knit and fine figure, and a quiet face, with much dignity and firmness of expression. His hair was light, his eyes large and clear. In his character the crafty traits predominated, but he displayed in

the latter part of his life much generosity.—See the life of Augustus in Suetonius, Plutarch's life of Antony, and the histories of Arnold, Merivale, and Ihne.

AUGUSTUS I. (as king, II.) **FREDERICK**, surname the Strong, elector of Saxony and king of Poland, second son of the elector John George III., born in Dresden, May 12, 1670, died in Warsaw, Feb. 1, 1733. After a careful education he visited all the countries and courts of Europe, Rome alone excepted. During these journeys he began the collection of pictures and other objects of art composing the gallery in Dresden, which, increased by his son, became one of the most celebrated in Europe. After the death of his father in 1691, and of his elder brother, John George IV., in 1694, he became sovereign of Saxony; and after the death of John Sobieski, king of Poland, in 1696, he was elected as his successor by the nobility of that country. To obtain this election he changed his religion from Protestantism to Catholicism. To restore to Poland some provinces wrested by Sweden, Augustus attacked Charles XII. jointly with Denmark and with Peter the Great of Russia; but after a long struggle, in which both Poland and Saxony suffered terribly, he was obliged at the bidding of Charles XII. to give up the royal crown, which the victor gave to Stanislas Leszczynski (July 12, 1704), and to give his own consent formally to this act, in the peace of Altranstädt (Sept. 24, 1706). When Charles was defeated at Poltava, July 8, 1709, Augustus renewed his alliance with Peter the Great, broke the peace with Sweden, entered Poland with an army, expelled Leszczynski, and recovered the crown. His reign was one of great luxury and splendor, his court a scene of uninterrupted festivity, with artists, adventurers, alchemists, and numberless beautiful women, one of whom, the celebrated Countess Königsmark, was by Augustus the mother of that Maurice so celebrated at the court of Versailles and in the history of France under the name of Marshal Saxe. Augustus was elegant, affable, and of extraordinary bodily strength, but without any trait of real excellence. He impoverished Saxony and corrupted Poland.—**Augustus II.** (III.) **FREDERICK**, son of the preceding, born in 1696, died Oct. 5, 1768. He succeeded his father in both Saxony and Poland, in the first by inheritance, in the second by election, though he was opposed by Stanislas Leszczynski, whose claims were supported by Louis XV. and a portion of the Polish nobles. Augustus continued the gorgeous reign of his father, his greatest passion being hunting and festivities. His reign over Poland was quiet, but in every respect demoralizing. Count Brühl, his favorite, ruled in the sovereign's name. Augustus, being married to an Austrian princess, had no other policy than subserviency to Austria, and he became entangled in the wars against Frederick the Great of Prussia. In 1742 he concluded an alliance offensive and defensive with Maria

Theresa, and promised afterward to bring into the field 50,000 men. This army, united with the Austrians, was beaten at the battle of Hohenfriedberg in Silesia, June 4, 1745, when Frederick invaded Saxony and entered Dresden, while Augustus fled to Poland, which was at peace with Prussia. By a treaty concluded at the close of the same year he was restored to his electorate. In the seven years' war, however, Augustus, as elector of Saxony, again participated on the side of Austria. At the beginning his Saxon army was compelled to surrender to Frederick (October, 1756), and he himself fled to Warsaw, persisting in his alliance with Austria, and resided there until the pacification by the treaty of Hubertsburg (1763), when he returned to Dresden.

AUGUSTUS FREDERICK, prince of Great Britain and Ireland, duke of Sussex, the 6th son of George III. of England, born in Buckingham palace, Jan. 27, 1778, died in Kensington palace, April 21, 1843. He studied at Göttingen, and subsequently travelled in Italy. While at Rome in 1793 he married Lady Augusta Murray, daughter of the Catholic earl of Dunmore; but as there were some doubts as to the validity of the marriage, the wedding ceremony was repeated in London, Dec. 5, 1793. This marriage was annulled, however, by the prerogative court of Canterbury, as contrary to the act 12 George III., cap. 8, which declared that no descendant of George II. should marry without the consent of the crown. Lady Augusta separated from the duke immediately after the publication of this sentence, having borne him a son and daughter, who took the name D'Este. In 1801 the prince was made a peer, and received a parliamentary grant of £12,000 per annum, which was subsequently increased by the addition of £9,000. In the house of lords the duke took the liberal side on most public questions, as the abolition of the slave trade, Catholic and Jewish emancipation, the reform bill, and free trade. In 1810 he was elected grand master of the freemasons; in 1816, president of the society for the encouragement of the useful arts; and in 1830, president of the royal society. He was a munificent patron of literature and art, and possessed one of the finest libraries of England. His liberal opinions in politics, and the part which he took in favor of Queen Caroline, made him unpopular at court, but before the death of George IV. a reconciliation took place between them.

AUK, the name of certain sea birds of the family *aleacæ*, including the subgenera *alca*, *fratercula*, *mergulus*, and *phaleria*. The true auks (*alca*) are strictly ocean birds, and scarcely ever leave the water, except to build their nests and breed in immense flocks in caverns and crannies of rocks, laying one disproportionately large egg. The young are fed from the crops of their parents, even after they can move about freely and shift for themselves. This genus contains but two species, the great auk

and the razor bill. The former (*A. impennis*, Linn.) is remarkable for the imperfect development of its wings, which are totally unfit for flying. They are set very far back on the body, and not much more than rudimental; but they are used by the bird as oars, and in conjunction with its feet it plies them with such power and velocity that it has been known to escape from a six-oared barge pulled by vigorous oarsmen. It rarely leaves the arctic circle and the waters adjoining, nor is it often seen off soundings, but dwells in great numbers about the Farø islands and Iceland, and it has been asserted that it breeds in Newfoundland. In summer all the upper parts of this bird's plumage are of a deep sooty black, which is changed in winter to white on the cheeks, the sides of the neck, and the throat. It breeds in June and July, and lays one large yellowish egg, as big as a swan's, irregularly dashed with black marks, which have been compared to Chinese characters. It has a large decurved

Great Auk (*Alca impennis*).

bill with sharp cutting edges; and its feet being situated at the extremity of its body, it stands or sits erect, propped up by its short stiff tail, after the manner of the penguins, which it not a little resembles.—The black-billed auk, razor bill, or murre (*A. torda*, Linn.) belongs to the northern latitudes, in the extreme height of which these birds swarm in multitudes during the breeding season, affording food and clothing to the Esquimaux, who place on them their chief dependence. The bill of the black auk has a sharp hook at its extremity, and a denticulated process at about two thirds of its length, which is of great use in securing its slippery prey. Its general color is dusky above and white below; it flies sufficiently well, but, like the species last described, uses its wings as oars in diving, which it does to perfection. It is very abundant on all the rocky coasts of Great Britain, where it sits in long horizontal rows on the steps or ledges of the crags, towering one above the other.—The genus *fratercula* consists of a single species,

the Labrador auk, common puffin, or coulterneb (*F. arctica*), this last name being admirably descriptive of its strong massive beak, the mandibles of which, when separated, especially the upper one, almost exactly resemble the coulter of a plough. The upper parts of this bird are dusky, its cheeks and belly white. It has a black collar, legs and feet orange, beak broad, cutting-edged, bluish gray next to the head, but scarlet thence to its obtuse point. Although it extends to the high arctic regions, it is in England only a summer visitor, breeding in the low sandy islands in rabbit burrows, of which it dispossesses their legitimate owners; or, where there are no rabbits, burrowing itself. In rocky places, as Dover cliffs, Flamborough head, and the Bass rock, at all which places these birds abound, they lay their single egg in the crevices of the rocks. When they have reared their young, they pass from England to the southern coasts of France and Spain, where they winter. Their burrows are curiously excavated, by means of their bills, to the depth of two or three feet, and often have two entrances for escape in case of surprise. The length of the puffin is about 12 inches.—The *mergulus* has likewise but one representative, the little auk, common rotche, or sea dove (*M. melanoleucos*), which is the smallest of the family, and a native of the very highest latitudes, congregating in large flocks near the arctic circle; Greenland, Spitzbergen, and Melville island being its favorite stations. Its plumage is black and white; and in winter the front of the neck, which is black in summer, turns white. It lays but a single egg, of pale bluish green, on the most inaccessible ledges of the precipices which overhang the ocean. It is about 9 or 10 inches long.—The last division, *phaleria*, contains also but a single species, the paroquet auk (*P. ptiliacula*), an extreme northern bird, about 11 inches long. Its head, neck, and upper parts are black, blended into ash color on the forward parts of the neck; the breast and belly white; the legs are yellowish, the beaks in the adults red. This bird swims and dives admirably, and is said to be of a singularly unsuspicious character, and easily captured. About midsummer it lays one large egg, nearly of the size of a hen's, with brown or dusky spots, on a whitish or yellowish ground.

AULAF, or Anlaf, a name borne by several Northumbrian kings of Danish origin, about the second half of the 10th century. I. A Northumbrian petty king and a pagan, died in 980. His family having been expelled from Northumbria by Athelstan, he fled into Ireland, fought against the native tribes in that island, in 937 endeavored to recover Northumbria, but was repulsed by Athelstan, returned to Ireland, and ravaged Kilcullen. After the death of Athelstan, Northumbria fell away from the English crown, and Aulaf recovered his inheritance after defeating Edmund at Tamworth and Leicester. Edred, the Eng-

lish king, successor of Edmund, made him do homage and embrace Christianity. In 952 Aulaf was driven out by the Christian Northumbrians, and, tired of struggling against the English, he went over to lead the Ostmen of Dublin against the Irish. He defeated Murdoch, king of Leinster, in 956, and put him to death the next year. Two more Leinster princes suffered the same fate in 977. At this time he called himself king of Ireland and the Isles. In 980 Aulaf lost his son and heir, Reginald or Regnell, in an engagement against the Hibernian aborigines, and in the same year, heart-broken, he went on a pilgrimage to Iona, where he died, after a stormy life. **II.** Son of Guthfrith, and uncle of the preceding, lived in the latter half of the 10th century. He joined in the wars of his nephew against the Saxons in south Britain and the Celts of Erin. He ravaged Armagh in 932, and Kilcullen in 938. In 939 he was obliged to shut himself up in Dublin. He made an irruption into England with his nephew, conquered Edmund, the successor of Athelstan, in 943, and recovered Northumbria. He lived and died a pagan and a hater of the Christian clergy.

AULIC COUNCIL (Lat. *aula*, a court or hall; Ger. *Reichshofrath*), a tribunal under the old German empire, standing at its first institution next in authority to the supreme imperial chamber (*Reichskammergericht*), to which it was afterward made equal in power. It was formed in 1501 by the emperor Maximilian, chiefly from members of his tribunal for the administration of justice in the Austrian dominions, and, as ultimately organized, consisted of a president, vice president, and 18 councillors, all appointed and paid by the emperor. The authority of the aulic council was confirmed at the peace of Westphalia, made equal to that of the chamber, and sharply defined in the decrees concerning it (*Reichshofraths-Ordnungen*) of 1559 and 1654. Six of the councillors must be of the Protestant religion, and the unanimous vote of these six could not be entirely overruled by the others, no matter what their majority. The council was divided into two sections, one of nobles (*Grafen und Herren*), the other of legal scholars or experts (*Gelehrte*), all equal in rank, though the last named class received higher salaries than the others. The vice chancellor appointed by the electorate of Mentz also had a seat in the council. This tribunal had exclusive jurisdiction over feudal affairs connected with the empire, appeals in criminal cases in the states immediately subject to the emperor, and questions concerning the imperial government itself. The members of the council held office, except in extraordinary cases, during one reign; each emperor, immediately on his accession, appointing new ones. The council passed out of existence with the old German empire itself in 1806.

AULIS, in ancient geography, a town of Hellas, in Bœotia, situated on the strait of Euripus,

which separates Bœotia and Eubœa; it had a temple of Diana. Here Agamemnon assembled his fleet preparatory to crossing the Ægean sea to Troy, and here his daughter Iphigenia was presented as a sacrifice to Diana. In the time of Pausanias only a few potters inhabited it.

AULNAY DE CHARNISÉ, Charles de Menon, seigneur d', a French proprietor, who figured largely in the history of Acadia or Nova Scotia, died in 1650. He was sent out about 1632 by Commander Isaac de Razilly, the proprietor of Acadia, and on his death acted as agent for his brother Claude de Razilly, whose rights he purchased in 1642. A civil war broke out soon after between him and La Tour, a neighboring proprietor, in which both parties committed excesses, and both sought the aid of New England. D'Aulnay secured the favor of the French government, and, after capturing Madame de la Tour in her fort in 1645, was appointed governor. His authority extended to the Kennebec. His widow, Jeanne Motin, married his old rival La Tour.

AUMALE (formerly *Albemarle*), a town of France, in the department of Seine-Inférieure, 40 m. N. E. of Rouen; pop. in 1866, 2,929. In 1592 a battle was fought here between the French and the Spaniards, in which Henry IV. was wounded. In the beginning of the 16th century Aumale was a county belonging to Claude de Lorraine, 5th son of René II., duke of Lorraine, who was afterward created duke of Guise by Francis I. of France, and became the head of the illustrious family of that name. It was raised to the rank of a duchy by Henry II., and held as such by Claude II., 3d son of Claude I., and brother of the celebrated Francis of Guise. This duke of Aumale distinguished himself during the war of the French against the emperor Charles V., was one of the promoters of the St. Bartholomew massacre, and was killed by a cannon ball before La Rochelle in 1573. His son Charles de Lorraine fought against Henry IV., assisting the duke of Mayenne in the battles of Arques and Ivry, where the troops of the league were defeated.—The title of duke of Aumale, after being extinct for years, was given to HENRI EUGÈNE PHILIPPE LOUIS D'ORLÉANS, 4th son of Louis Philippe, born in Paris, Jan. 16, 1822. Like his brothers, he was educated at one of the public colleges of Paris. In 1839 he was appointed captain in the 4th regiment of the line; he took part in the African expedition of Médéah, served a second campaign in Algeria, and returned to France in 1841 on account of ill health. While entering Paris, Sept. 13, 1841, at the head of the 17th regiment, of which he had been appointed colonel, a man of the name of Quenisset discharged a gun at him, but missed his aim. In 1842 he was made brigadier general, and commander of the district of Médéah. On May 16, 1843, he attacked and routed Abd-el-Kader, and as a reward was made lieutenant general and commander of the province of Constantine.

In 1847 he was appointed governor of Algeria in place of Marshal Bugeaud, and soon afterward received Abd-el-Kader's surrender. In 1848, on hearing of the revolution in Paris, he exhorted the population to wait calmly for further developments; and on March 3 he resigned and joined the other members of his family in England. On the outbreak of the Franco-German war in 1870 he offered his services to the government, but they were not accepted. After the downfall of Napoleon III. he returned to France, and in 1872 took his seat as a member of the national assembly. His eldest son, prince de Condé, died in Australia in 1866, aged 21, and his wife, a Neapolitan princess, in 1869. His only remaining child, the duke de Guise, born Jan. 5, 1854, died in Paris, July 25, 1872. He inherited a large fortune from the Condé family. In 1872 he was elected a member of the French academy. Besides pamphlets and articles on political and military matters, he is the author of *Histoire des princes de Condé* (2 vols., Paris, 1869), translated into English by the Rev. R. Brown-Borthwick (2 vols., London, 1872).

AUNGERVYLE, Richard (known in history as Richard de Bury), an English statesman and bibliographer, born near Bury St. Edmunds in 1287, died at Bishop's Auckland, April 24, 1345. He was educated at Oxford, appointed tutor of the prince of Wales, and after the accession of his pupil to the throne as Edward III. received successively the appointments of coiffeeur to the king, treasurer of the wardrobe, and keeper of the privy seal. In 1333 he was consecrated bishop of Durham. In 1334 he succeeded Archbishop Stratford as lord high chancellor of England, which office he resigned in 1335 for that of treasurer. He went several times abroad as ambassador, once to Rome and thrice to Paris. Aungervyle was a diligent purchaser of rare and costly books, and when bishop of Durham his collection was one of the largest in England. He founded also for the use of the students at Oxford a library, which was then the best in the kingdom. The latter part of his life he gave up entirely to books. He left a Latin treatise on bibliography (the earliest by any English writer), entitled *Philobiblon* (Cologne, 1473; English translation by J. B. Inglis, London, 1832); *Epistolæ Familiarium*, including some letters to his friend Petrarch; and *Orationes ad Principes*.

AURELIAN (LUCIUS DOMITIUS AURELIANUS), a Roman emperor, born in Pannonia, or according to some authorities on the southern confines of Dacia, in the early part of the 3d century, assassinated between Heraclea and Byzantium, A. D. 275. His parents were poor and of the lowest class. He entered a Roman legion at an early age, and by his bravery and the remarkable feats of arms which his almost gigantic stature and great strength enabled him to perform he secured rapid promotion, and great personal popularity with the soldiers, among whom he was designated as *Aurelianus*

manu ad ferrum (Aurelian Sword-in-Hand). He distinguished himself under Valerian and Claudius II. in campaigns against the Goths; and when Claudius died, although his brother Quintillus assumed the purple as his heir, Aurelian was proclaimed emperor by the army of the Danube, of which he was then in command (270). Quintillus committed suicide after a nominal reign of several weeks, and Aurelian took the throne without opposition. He drove the Goths beyond the Danube, carried on successful campaigns against the Alemanni and other German tribes, and to protect Rome against them built a line of strong walls, the ruins of which may still be traced about the city. He next undertook a war against Palmyra, then a magnificent city in the height of its prosperity, ruled by Zenobia, the widow of King Odenathus. He captured the city after one of the ablest defences in history, treated the people with comparative kindness, and refused to put Zenobia to death, though his troops demanded her execution. After his departure the Palmyrenes rose and massacred the Roman garrison; upon this he returned, destroyed the city, and put the people to the sword (273). Zenobia was carried to Rome, and appeared in the emperor's triumph. Aurelian next defeated an attempt at rebellion made by the Egyptians under their Roman governor. Tetricus, who had made himself the independent ruler of the greater part of Gaul, now surrendered after little more than the threat of a war; and the Roman empire resumed something of its old territorial importance. The senate bestowed upon Aurelian the title of "restorer of the empire." After effecting many improvements in the government of the city, the discipline of the army, and the condition of the people, the emperor was murdered while on the way to a campaign against the Persians, by his secretary, whom he had offended by some harsh treatment long before.

AURELIUS, Marcus. See ANTONINUS.

AURELLE (or **D'AURELLE**) **DE PALADINES**, a French soldier, born in 1803. He distinguished himself in the Crimean war. Before the outbreak of the war with Germany in 1870 he was commander of the 5th military division of France, at Metz. After the fall of the empire he was charged by the provisional government at Tours with the formation of the army of the Loire. After a battle near Coulmiers, he drove Gen. von der Tann from Orleans (Nov. 9-10), winning the first French victory over the Germans. For this he was appointed (Nov. 15) commander-in-chief of the army of the Loire. On Nov. 28 he attacked the left wing of Prince Frederick Charles at Beaune-la-Rolande, but encountered a severe repulse. On Dec. 2 he was beaten by the grand duke of Mecklenburg at Artenay, and on Dec. 3 Frederick Charles drove him back to the forest of Orleans, renewing the attack the next day and taking possession of the town at midnight, after brisk fighting.

On the same day the French had been thoroughly routed by another detachment of Frederick Charles's army near Chevilly and Chilleux, and driven either across or along the Loire above Orleans, thus splitting the army of the Loire into two portions. D'Aurelle was removed from his command. He refused the command of the camp of Cherbourg, as well as the appointment of successor to Gen. Chanzy. As member of the national assembly at Bordeaux he opposed the continuation of the war, and was one of the committee of fifteen appointed to assist Thiers and Favre in arranging the preliminaries of the treaty of peace. He became commander-in-chief of the national guard of the department of the Seine, and in 1872 a member of the court martial for the trial of Marshal Bazaine.

AURICH, a town of Germany, in the Prussian province of Hanover, capital of an administrative division of the same name, and formerly capital of the principality of East Friesland, 60 m. N. W. of Bremen; pop. in 1871, 4,261. It has a castle which was formerly the residence of the prince of East Friesland, a college (gymnasium), and a normal school.

AURIFABER, the Latinized name of JOHANN GOLDSCHMIED, or GOLDSCHMIDT, one of the companions of Luther, born near Mansfeld in 1519, died at Erfurt in 1579. He studied at Wittenberg, and became Luther's amanuensis in 1545. In the Smalcaldic war he was chaplain to a Saxon regiment, and in 1551 court chaplain of the elector of Saxony, but he became involved in theological disputes and was removed in 1562. He collected the unpublished manuscripts of Luther, and was one of the collaborators of the Jena edition of the reformer's works. He edited the *Epistole Lutheri* and the "Table Talk." In 1566 he became pastor at Erfurt.

AURILLAC, a town of southern France, capital of the department of Cantal, in a valley on the Jourdanne, here spanned by a fine bridge, about 80 m. S. by W. of Clermont; pop. in 1866, 10,998. It is well built, with wide streets, kept clean by the overflowing of a large reservoir, into which two fountains discharge. The old buildings include the castle of St. Stephen, the church of St. Géraud, the church of Notre Dame of the 18th century, and the college, which contains a valuable library and a cabinet of mineralogy. The manufactures are copper utensils, jewelry, woollen stuffs, blondes, laces, and paper.—Aurillac was founded in the 9th century. The wall formerly surrounding it has been destroyed. The town suffered much in the wars of the 14th, 15th, and 16th centuries.

AURIOL, a French borough in the department of Bouches-du-Rhône, 16 m. N. E. of Marseilles; pop. in 1866, 5,182. It has manufactures of flags, and near it are coal mines.

AURIVILLIUS, *Karl*, a Swedish orientalist, born at Stockholm in 1717, died in 1786. He mastered the Syriac, Arabic, Sanskrit, and

other oriental languages. After 1754 he resided at Upsal, at first giving private instruction in the poetry of different nations, and in 1772 was appointed professor of oriental languages in the university. He succeeded Linnaeus as member of the academy of sciences in Upsal, and was an active member of the commission for preparing a new translation of the Bible into Swedish.

AUROCHS, the *bos bison* of Europe, one of the contemporaries of the mammoth (*elephas primigenius*), an animal of the ox family, once abundant, but now existing only in the forests of Lithuania belonging to the czar of Russia, and possibly in the Caucasus. It would long ago have become extinct but for the protection of man. The ure-ox (*B. urus* or *B. primigenius*), found in the post-tertiary deposits, is

believed to be the same as was described by Cæsar in his Commentaries as abounding in the forests of Gaul; it existed in Switzerland as late as the 16th century. Both species are found abundantly in the post-tertiary of Europe, and corresponding species in America, and no doubt furnished a large share of the food of prehistoric man.

AURORA (in Greek, Eos), the goddess of the morning, was the daughter of Hyperion and Thia, the wife of Astræus, and the mother of the winds. She carried off Orion to the island of Ortygia, and detained him there till he was slain by Diana. She bore away Cephalus, and had by him a son named Phaëthon. To Tithonus, son of Laomedon, king of Troy, she bore Memnon and Æmation. Aurora is sometimes represented in a saffron-colored robe, with a wand or torch in her right hand, emerging from a golden palace, and ascending her chariot; sometimes in a flowing veil, which she is in the act of throwing back, opening the gates of morning; and sometimes as a nymph, wearing a garland and standing in a chariot drawn by winged horses, with a torch in one hand and flowers in the other, which she scatters as she goes.

AURORA, a city of Kane county, Ill., on Fox river and the Chicago, Burlington, and Quincy railroad, 40 m. W. by S. of Chicago; pop. in 1860, 6,011; in 1870, 11,162. It contains 14 churches, a handsome city hall, a college, and many important manufactories, the power for which is furnished by the Fox river. The construction and repair shops of the railway situated here employ about 700 men. A semi-weekly newspaper, and 3 weeklies, one of which is German, are published here.

AURORA BOREALIS (more correctly *Aurora Polaris*, since the phenomenon is not confined to northern latitudes), called also **NORTHERN STREAMERS** and **NORTHERN LIGHTS**, a luminous appearance, associated with energetic disturbances of the earth's magnetism and electrical condition. It is seldom seen save in high latitudes, though occasionally the tropics are visited by auroral displays. In polar regions auroras are very common, and usually far more brilliant than in the temperate zones. Humboldt gives the following description of the appearances presented when the auroral phenomena are fully developed, although it must be understood that there is considerable variety in these displays: "An aurora borealis is always preceded by the formation of a sort of nebular veil which slowly ascends to a height of four, six, eight, or even to ten degrees. It is toward the magnetic meridian of the place that the sky, at first pure, commences to become brownish. Through this obscure segment, the color of which passes from brown to violet, the stars are seen as through a thick fog. A wider arc, but one of brilliant light, at first white, then yellow, bounds the dark segment. Sometimes the luminous arc appears agitated for entire hours by a sort of effervescence and by a continual change of form, before the rising of the rays and columns of light, which ascend as far as the zenith. The more intense is the emission of the polar light, the more vivid are its colors, which from violet and bluish white pass through all the intermediate shades to green and purple red. Sometimes the columns of light appear to come out of the brilliant arc mingled with blackish rays similar to a thick smoke. Sometimes they rise simultaneously in different parts of the horizon; they unite themselves into a sea of flames, the magnificence of which no painting could express, and at each instant rapid undulations cause their form and brilliancy to vary. Motion appears to increase the visibility of the phenomenon. Around the point in the heavens which corresponds to the direction of the dipping needle produced, the rays appear to assemble together and form a boreal corona. It is rare that the appearance is so complete and is prolonged to the formation of the corona; but when the latter appears, it always announces the end of the phenomenon. The rays then become more rare, shorter, and less vividly colored. Shortly nothing more is seen on the celestial vault than wide, motionless nebulous spots, pale or of an

ashen color; these disappear while the traces of the dark segment whence the phenomenon originated remain still on the horizon." Although auroras are more commonly seen in high latitudes than near the tropics, it is not toward the true poles of the earth that the increase takes place, nor does the increase continue after certain high latitudes have been reached. Thus the frequency of auroras is different at different stations in the same latitude; and in passing poleward from places in a given latitude, the region of maximum frequency is reached more quickly in some longitudes than in others. Thus an inhabitant of St. Petersburg would have to travel to lat. 71° N. before reaching the place of greatest auroral activity; while an inhabitant of Washington need travel northward only to lat. 56° to reach the region where auroral displays are most frequent. The zone on the earth's northern hemisphere where auroras occur most commonly and attain their greatest splendor, may be represented by constructing a ring of card or paper, of such dimensions as to agree with the 60th parallel of north latitude, and then pushing the ring southward on the side of America and northward on the side of Asia, until it passes through the most southerly part of Hudson bay and the most northerly part of Siberia. The position of the corresponding zone in the southern hemisphere has not yet been determined; but it is believed that the southern zone of maximum auroral frequency is nearly antipodal to the northern zone. From what we know of the connection between the occurrence of auroras and disturbances of the earth's magnetism, we have every reason to believe that as the magnetic poles of the earth are slowly shifting, so the zone of maximum auroral frequency must also change in position. It cannot be doubted, for example, that in the 17th century, when the northern magnetic pole lay between England and the north pole, terrestrial conditions were more favorable for the occurrence of auroras in England than they now are, or than they then were in corresponding latitudes in North America. At present, on the contrary, the northern magnetic pole lies between the north pole and the northwestern extremity of the American continent; hence auroras are more frequent and more brilliant in North America than in corresponding latitudes in Europe.—To the description given by Humboldt we should add that sometimes in high latitudes, instead of extending from the horizon, the auroral arch appears in the form of a complete oval. Hansteen relates that at Christiania he twice saw the auroral arch in this form. Sometimes more than one arch has been seen. Thus the observers who were sent by the French government to winter at Bossekop in Finland, saw on one occasion no fewer than nine arches, separated by dark spaces, "and resembling in their arrangement magnificent curtains of light, hung behind and below each other, their brilliant folds stretching com-

pletely across the sky." The position of the luminous region is not known. Arago was of opinion that each observer sees his own aurora, somewhat as each observer of a rainbow sees the luminous arc differently placed. Sir John Herschel says "no one can doubt that the light of the aurora originates nowhere but in the place where it is seen." But it has been considered that the most favorable conditions for the determination of the height of auroral gleams are presented when the auroral corona is formed. Now this corona always surrounds the point toward which the magnetic dipping needle points. Yet the magnetic dipping needles at different stations are not directed toward one and the same point; so that whatever the auroral corona may be, it does not seem to hold a definite place, in such sort that its distance can be determined by simultaneous observations; for it is the essential principle of the method of simultaneous observations that the lines of sight should be directed to one and the same point. Nor is it easy, on Herschel's theory, to interpret the fact that the auroral corona has been seen at stations distant more than 1,000 miles from each other, and always around the part of the heavens pointed to by the magnetic dipping needle. For a point immediately overhead at one station, and 100 miles from the earth's surface, would be below the horizon of a station 1,000 miles distant. We seem forced to adopt the conclusion that though there is no analogy whatever between the aurora and the rainbow, yet Arago was right when he asserted his belief that as each observer sees his own rainbow, so each observer sees a different aurora. We should thus be led to consider whether the nature of the luminous emanations—the direction, for instance, of the luminous flashes composing them—may not explain the formation of the auroral corona. In this case the position of the observer would affect the appearance of the phenomenon.—If we assume that reliance can be placed on the observations by means of which the height of the auroral arch has been estimated, we must assign a considerable elevation to many of these lights. On Oct. 17, 1819, an aurora was observed simultaneously at Gosport, Kewick, and Newtown Stewart, in Great Britain; and from the calculations made by Dalton the meteorologist, the arch was estimated to be 101 or 102 miles above the earth. More recently Sir John Herschel estimated that the arch in the aurora of March 9, 1861, was 83 miles above the earth. But he remarks that "the auroral light has been seen below the clouds, as in the polar seas by Parry, Sherer, and Ross, on Jan. 27, 1825; near the chain of the Rocky mountains on Dec. 2, 1850, by Hardisty; and at Alford in Scotland on Feb. 24, 1842, by Farquharson; nay, even habitually seen as if hovering over the Coreen hills in the last-mentioned neighborhood, at a height of from 4,000 to 6,000 miles." Herr Galle, from observations made during the aurora of Feb.

4, 1872, estimates the height of the auroral corona on that occasion at 285 miles above the sea level. Prof. Olmsted's conclusion that the auroral arch is seldom below 70 miles in height or above 160 miles, would thus appear to be negatived. But probably all such estimates must be abandoned, and "our meteorological catalogues," as Arago advised, "must be disencumbered of a multitude of determinations of height, though due to such great names as Mairan, Halley, Kraft, Cavendish, and Dalton."—The extent of the earth's surface over which the same aurora has been visible has sometimes been remarkable. Kämtz mentions that on Jan. 5, 1769, a splendid aurora was seen simultaneously in France and in Pennsylvania; and that the remarkable aurora of Jan. 7, 1831, was seen from all parts of central and northern Europe, in Canada, and in the northern parts of the United States. But even these instances, and others of the same kind which might be cited, are surpassed in interest by the circumstance that auroras of great brilliancy occur simultaneously over the major part of both the northern and southern hemispheres. Kämtz mentions that when Capt. Cook's observations are analyzed, it appears that on every occasion when he observed an aurora australis an aurora borealis had been seen in Europe, or else the agitation of the magnetic needle proved that around the northern magnetic pole an auroral display must have been in progress. The aurora of Feb. 4, 1872, was seen not only in America and Europe, and over the northern hemisphere generally, as far S. as lat. 14° N., but in Mauritius, in South Africa, in Australia, and probably over the greater part of the southern hemisphere (for Mauritius is much further north than southern auroras are ordinarily seen).—Mairan and Cassini were the first to point out that auroras do not occur at all times with equal frequency or in equal splendor. The former mentions that a great number of auroras were seen at the beginning of the 16th century (a misprint probably for the 17th, as the context seems to imply) to beyond the year 1624, after which nothing more was heard of them till 1686. Kämtz mentions that between 1707 and 1790 there was a remarkable increase followed by decrease of auroral action, the maximum frequency being attained in 1790. Prof. Olmsted considered that there was sufficient evidence to establish a period of 20 years during which auroral displays are frequent, preceded and followed by intervals of from 60 to 65 years during which few are witnessed. But it is open to question whether the existence of this long period is as yet established. The actual frequency of auroras cannot be inferred from observations made in temperate latitudes, where alone hitherto any attempt has been made to determine long periods. The longest period which has been thoroughly established is one of about 11 years. This period is associated with the occurrence of magnetic disturbances in cycles of 11 years. The connection

between auroral action and disturbances of the earth's magnetism appears to have been demonstrated, though doubt still remains as to the exact nature of the association. The perturbations of the magnetic needle undoubtedly attain their maximum extent at intervals separated by about 11 years. The researches of Sabine, Lamont, and Wolf appear to have established that fact beyond dispute. Hence we may infer that the auroral action waxes and wanes within the same period.—A remarkable association also appears to exist between disturbances of the earth's magnetism and the occurrence of spots on the sun. It has been demonstrated that the solar spots increase and diminish in a period of about 11 years; and that this periodicity corresponds exactly with the periodicity of the magnetic perturbations. A great solar outburst witnessed by Carrington and Hodgson, Sept. 29, 1859, was not only accompanied by extensive magnetic disturbances, but on the same day remarkable auroras occurred in both hemispheres. Telegraphic communication was interrupted on all the principal lines; the operators at Washington and Philadelphia received sharp electric shocks; and the pen used in Bain's system of telegraphy was followed by a flame. Some doubt has been thrown on the supposed connection between these circumstances and the solar outburst, in consequence of the failure of observers to obtain any corroborative evidence during the past 13 years; but the connection between the condition of the solar surface and the earth's magnetic state, and therefore the connection between the solar spot period and auroral displays, has been thoroughly established. The following table exhibits the number of auroras seen in each month, in America and Europe, according to the observations of Prof. Loomis of Yale college and Kämtz of Germany. These observations, however, must not be looked upon as indicating the relative frequency of auroras in America and Europe, because the observations of Loomis and Kämtz range over a different number of years:

	Loomis.	Kämtz.		Loomis.	Kämtz.
January.....	173	229	July.....	244	87
February.....	210	307	August.....	233	217
March.....	240	440	September.....	293	405
April.....	267	313	October.....	236	497
May.....	191	184	November.....	215	235
June.....	179	65	December.....	159	225

In each case there is a double maximum, the two equinoxes being the epochs at which auroras are most frequent; and it is noteworthy that in these months the solar poles are most inclined toward the earth, the southern pole in March, the northern pole in September; so that the southern spot zone is nearer to the centre of the sun's face in March than at any other time, while the northern spot zone holds a corresponding position in September.—As to the electrical character of the phenomenon no question can be entertained, though there are few problems of greater difficulty than the determination of the exact manner in which

the electrical action is excited. It has been held by some that the aurora is due to electrical discharges from the earth. Through some cause the earth, regarded as a vast magnet, becomes overcharged (according to this theory) with electrical energy, and it is as this energy is gradually dissipated that the splendors of the aurora are displayed. It has been noticed that whenever the earth's magnetism is unusually intense an auroral display is to be expected. As soon as the aurora has made its appearance the intensity of the magnetic force begins to diminish. The more brilliant the aurora, the more rapidly is the extra energy of the earth's magnetism dissipated. "It has also been observed by operators of the Bain or chemical telegraph, that very singular effects are produced by the aurora upon the telegraph wires. The atmospheric electricity generated during thunderstorms passes from the wire to the chemically prepared paper, emitting a bright spark and a sound like the snapping of a pistol. It never remains long upon the wires, though it travels sometimes 40 or 50 miles before discharging itself. But the electricity produced by the aurora passes along the wires in a continuous stream with no sudden discharge, effecting the same result as that by the galvanic battery. A colored mark upon the paper is made by the positive current of the aurora as by the positive pole of the battery; the negative current, on the contrary, produces a bleaching effect. Preceding the appearance of the aurora faint blue lines appear on the paper, which gradually become stronger and darker so as to burn through several thicknesses of it. The effect then disappears, and is soon followed by the bleaching process, which entirely overcomes the artificial current of the batteries. When these effects have been observed, the aurora follows, and presents some of its most beautiful displays along the lines of these telegraphs; and so familiar have the operators become with the disturbance which the aurora causes, that they can predict its appearance with much certainty. They regard the electricity generated by it as precisely that of the electro-galvanic battery, which is distinguished by its voluminous current without intensity of action, differing from atmospheric electricity or the kind developed by friction, which may be dissipated by placing a wire conductor leading to the ground in close proximity to the line of wires." Capt. McClintock observed in the arctic regions that the aurora was never visible above ice fields, but that whenever an aurora was in progress the light appeared always to be gathered over the surface of the open water. Water being, as is well known, an excellent conductor of electricity, while ice is a non-conductor, we may infer that the peculiarity observed by McClintock was due to this difference in the conducting powers of ice and water. In fact, on the theory that the aurora is due to electrical discharges from the earth, these discharges were

interrupted by the fields of ice.—The study of the aurora with the spectroscope has revealed some important facts, though it has as yet thrown no light on the nature of the phenomenon. Angström of Sweden, in the winter of 1867-'8, recognized the existence of a bright yellow-green line in the auroral spectrum; and Otto Struve of Russia presently confirmed this result. It was at the time supposed that this line constituted the whole of the spectrum; and Dr. Huggins, commenting on the discovery, remarked in 1868 that the result seemed surprising when the ordinarily ruddy hue of the aurora was taken into account. "But Gen. Sabine tells me," he adds, "that in his polar expeditions he has frequently seen the aurora tinged with green, and this appearance corresponds with the position of the line seen by M. Struve." Later observations, however, and especially those made by Prof. Winlock in this country, have shown that the auroral spectrum is far more complex than had been supposed, and that it is also variable. It would appear that the bright green line is always present, and that it is nearly always the brightest line of the spectrum. But there is also a band in the red which, though usually much less intense, yet becomes even brighter than the yellow-green line when the red streamers of the aurora are exceptionally brilliant. The wave lengths of the green and red light correspond respectively to 558 and 635. Besides these there are faint greenish and bluish lines corresponding to wave lengths 544, 581, 522, 518, 501, and 485. Two other bands in the blue and violet between the lines F and G (one of them very close to G) have been detected in the spectrum of white parts of the aurora. They disappear or become faint in the parts having an intense red tint. During the great auroral display of Feb. 4, 1872, Father Perry of the Stonyhurst observatory (England) remarked that "the green line could always be detected, even where the unassisted eye failed to notice any trace of auroral light. This," he adds, "might suggest the advisability of a daily observation with a small hand spectroscope for those who are desirous of forming a complete list of auroral phenomena. Magnetic disturbances are a sure guide in the case of grand manifestations of aurora; but might not a very slight aurora be observable without the magnetic needle being sensibly affected?" One of the most remarkable circumstances hitherto ascertained respecting the aurora is the partial agreement of its spectrum with that of the solar corona. It is not indeed the case, as is sometimes stated, that the principal line in the coronal spectrum (known as the 1474 line, because agreeing with the corresponding line of Kirchhoff's scale) coincides with the bright yellow-green auroral line; but another and fainter auroral line agrees with Kirchhoff's 1474, and there is sufficient general resemblance between the coronal and auroral spectra to

justify the theory that a real resemblance exists between the aurora and the solar corona. This theory was first worked out and published by Prof. W. A. Norton of Yale college; but Prof. Winlock of Cambridge also formed and published a similar theory.—Some doubt seems still to prevail on the question whether the bright green line of the auroral spectrum belongs also to the spectrum of the zodiacal light. Angström and Respighi have asserted that this is the case; but others deny that the auroral green line is ever seen in the zodiacal spectrum save when an aurora is in progress. Mr. Webb observes of the zodiacal light, Feb. 2, 1872: "It seemed to show a ruddy tinge not unlike the commencement of a crimson aurora borealis; this may have been a deception, but it was certainly redder or yellower than the galaxy. At 7 I examined it with a pocket spectroscope which shows very distinctly the greenish band of the aurora; but nothing of the kind was visible, nor could anything be traced beyond a slight increase of general light, which in closing the slit was extinguished long before the auroral band would have become imperceptible." M. Liass also, who has for several years studied the zodiacal light in tropical countries, finds its spectrum to be ordinarily continuous. Yet undoubtedly the yellow-green line is seen in the spectrum received from the region occupied by the zodiacal, during auroral displays; though whether it is then simply the auroral line seen in the direction of the zodiacal as well as in others, or partly received from the zodiacal itself, remains an open question. In the latter case it would follow, of course, that there is an intimate connection, as Mairan long ago suspected, between the zodiacal light, which is undoubtedly a cosmical phenomenon, and the aurora, which is as undoubtedly a terrestrial manifestation, though not improbably of cosmical origin. Prof. Olmsted had several years ago assigned to the aurora an interplanetary origin. "The nebulous matter," he reasoned, "like that which furnishes the material of the meteoric showers or the zodiacal light, and is known to exist in the interplanetary spaces, is probably the cause of the auroral displays. The periodical return of the phenomena indicates such a position; so too its rapid motion, which exceeds that of light or electricity, and the extent of surface over which the phenomenon is seen at the same time." It should be added that during the months of January, February, and March, 1872, when auroras occurred with unusual frequency, the zodiacal light shone with exceptional brilliancy.

AURUNGABAD, a city of N. W. Hindostan, in the native state of Hyderabad or the territory of the Nizam, on the Doodna, a small tributary of the Godavery, 175 m. E. N. E. of Bombay. It was an unimportant village called Gurka until the time of Aurungzebe, who made it a favorite residence, and built here a mausoleum to the memory of his daughter.

ter. The town is well laid out, but the buildings are in a dilapidated condition, and the climate is unhealthy. The population was estimated in 1825 at 60,000, but is now much smaller. Water is supplied by means of conduits and pipes, and a considerable trade is

pire, the foundation of which had been almost imperceptibly laid by an adventurer named Sevajee. Against this leader Aurungzebe sent in vain his most experienced generals, and he therefore marched into the Deccan himself to superintend the war. He resided in the Deccan 22 years, subduing the Carnatic and ruling an empire which in wealth and population was probably unsurpassed by that ever held by any other monarch. The proper name of Aurungzebe was Mohammed, and that by which he is commonly known, meaning the "ornament of the throne," was given him by his grandfather. He himself preferred the title of Alum-Geer, "conqueror of the world," and he was accustomed to have carried before him a globe of gold as his symbol. Yet to show that he as yet held but three fourths of the earth, he used to tear off a corner from every sheet of paper which he used in his correspondence. India owes to him several of her finest bridges, hospitals, and mosques. In his personal habits he was remarkable for an ascetic simplicity; and in his zeal for the Mohammedan faith he became a persecutor of the Hindoos.

Mosque of Aurangzebe.

carried on. The town was formerly the capital of a province of the same name, containing about 50,000 sq. m., which was incorporated with the Mogul empire in 1638. In more recent periods it belonged partly to the Mahrattas and partly to the Nizam, but is now mostly under British rule.

AURUNGZEBE, or *Aurangzeb*, the last great emperor of the Mogul dynasty in India, born Oct. 22, 1618, died at Ahmednuggur, Feb. 21, 1707. He was appointed by his father, Shah Jehan, to be viceroy of the Deccan. Here, while affecting an entire indifference for worldly things, he acquired military experience and amassed great wealth. In 1657 the emperor was taken suddenly ill, and Dara, the heir apparent and eldest brother of Aurungzebe, assumed the administration. Aurungzebe united with a younger brother in defeating Dara, and soon succeeded by his energy and treachery in putting to death all his brothers and their sons. His father, having meantime recovered, was confined for the rest of his life as a prisoner in his own palace, and Aurungzebe grasped the imperial power. His reign was the most brilliant period of the domination of the race of Akbar in India, and his empire included nearly all the peninsula of Hindostan, with Cabool on the west and Assam on the east. The first 10 years of his administration were marked by a profound peace, and his wisdom was especially signalized in the measures which he took in anticipating and assuaging a famine, and in suppressing an insurrection of Hindoo devotees headed by a female saint. A greater misfortune to him was the rise of the Mahratta em-

AUSCHWITZ (Pol. *Oświęcim*), a town of western Galicia, in Austria, 82 m. W. of Cracow, and about 8 m. from the frontier of Prussian Silesia; pop. 8,600. It is the principal town of the former, originally Polish, then Silesian, and then again Polish, duchies of Auschwitz und Zator, with an area of about 1,000 sq. m., which in 1564 were united into one duchy by King Sigismund Augustus, and in 1778 incorporated with Austria. Although belonging to Galicia, the territory of the duchy was in 1818 declared by Austria to belong to the Germanic confederation. Only about one tenth of the population of the duchy speak German. In the war of 1866 there was an engagement at Auschwitz on June 27 between Prussian and Austrian troops.

AUSCULTATION (Lat. *auscultare*, to listen), a branch of medical art by which the states and motions of internal organs are discerned through the sounds which they produce. Pulsations, respirations, and the vibratory movements in the body produce sounds which may be distinctly heard by placing the ear upon the walls of the chest, or other parts of the external frame. The heart beats strongly many times per minute, and each pulsation gives a shock to the surrounding parts, and also produces a double sound within the heart itself. At every breath the air is first drawn into the lungs, and again passes out by expiration. The passage of the air into the lungs produces one kind of sound peculiar to the act of inspiration, and its exit another peculiar to expiration. In a state of healthy action, the sounds of the heart and those of the lungs and air passages are of a peculiar nature, and a little practice enables the ear to become familiar with each special sound. In a diseased state, the action of both heart and lungs is modified to some extent, and

the sounds produced are also modified in a peculiar manner. To assist the ear in distinguishing these sounds, Laennec constructed the stethoscope (Gr. *στήθος*, chest or breast, and *σκοπεῖν*, to examine), by the aid of which all the sounds of the heart and lungs may be distinctly heard, and the differences between healthy and diseased action readily discerned and classified. The art of auscultation has since then made rapid progress.—Auscultation is very useful in obstetrics, as well as in diseases of the heart and lungs. In difficult cases of parturition, it is often necessary to know whether the child is dead or alive in the womb before delivery. After the fifth month of pregnancy the pulsations of the fetal heart may be distinctly heard, and the "placental murmur," caused by the uterine circulation of the blood, may also be distinguished by the ear.—Percussion is a branch of auscultation by which artificial sounds are obtained as a means of discerning the state of the parts from which these sounds proceed, particularly in regard to the presence or absence of air or liquids.—The art of auscultation is of comparatively recent date, but it was long believed to be a useful aid in diagnosis. In the middle of the 17th century Hooke observed that "there may be a possibility of discovering the internal motions and actions of bodies by the sounds they make. . . . I have been able to hear very plainly the beating of a man's heart." In 1761 Leopold Auenbrugger, a German physician residing at Vienna, published a small volume in Latin explaining an artificial method of producing sounds in various regions of the body, by which the physician might judge of the state of the subjacent parts. This method was percussion. The book remained almost unknown till 1808, when Corvisart translated it into French, and made the method known to all the countries of Europe. The practice of percussion has since become general, and in many cases is found highly useful. The method of studying diseases from sounds made by percussion led to the method of observing sounds made naturally, by the action of the heart and lungs. Corvisart took up the subject with great zeal, and three of his disciples, Double, Bayle, and Laennec, continued the same course, resulting in the discovery of the stethoscope, and the general use of auscultation.

AUSONES, the name of one of the most ancient tribes of Italy, whose origin is unknown. Tradition made them descendants of Auson, son of Ulysses and Calypso. They are held by Niebuhr to have been a portion of the great Oscan nation. From them the southern part of Italy, later known as Magna Græcia, was called Ausonia.

AUSONIUS, *Decimus Magnus*, a Latin poet and grammarian, born at Burdigala (Bordeaux) about A. D. 310, died about 394. He practised law for a time in his native town, and afterward became a teacher of grammar and rhetoric. In 367 he was selected by the emperor Valentinian

to be tutor to his son Gratian, whom he accompanied into Germany the following year. He rose successively to the honorary titles and dignities of count of the empire, quaestor, governor of Gaul, Libya, and Latium, and lastly, in 379, of consul. His poetry is characterized by extreme licentiousness and pruriency, and is bald of invention and redundant in ornament. There has been much discussion whether Ausonius was a Christian or a pagan. The best editions of Ausonius are: a very rare one by Tollius (Amsterdam, 1671), with a commentary of Scaliger, and selected notes by various critics; the Delphin edition; and the Bipont of 1783, which is correct and of authority.

AUSSIG, a town of Bohemia, in the circle of Leitmeritz, at the junction of the Billa with the Elbe, 44 m. (direct) N. N. W. of Prague, with which it is connected by railway; pop. in 1869, 10,933. It was formerly strongly fortified, but in 1426 it was destroyed by the Hussites, and in 1639 it was seized by the Swedish general Baner. It has a church said to have been built in 826, containing a Madonna by Carlo Dolce, presented to the town by the father of Raphael Menga, who was born here. The town has an active trade in fruit, mineral waters, timber, and especially in coal. The battlefield of Kulm is in the vicinity.

AUSTEN, *Jane*, an English novelist, born at Steventon, in Hampshire, Dec. 16, 1775, died in Winchester, July 18, 1817. She was educated by her father, who was rector of Steventon. It is not known at what time she commenced authorship. In her youth she was beautiful and graceful, but a disappointment in love determined her against marriage. "Northanger Abbey" (which was published with "Persuasion" after her death) was the earliest and weakest of her works, all of which, except the posthumous ones, appeared anonymously. "Sense and Sensibility" was published in 1811, and immediately obtained popularity. "Pride and Prejudice," "Mansfield Park," and "Emma" succeeded at regular intervals—the last in 1816. Her father was compelled by ill health to pass his latter years in Bath, and on his death his widow and two daughters returned to Hampshire, and removed in May, 1817, to Winchester. Her novels have long been popular as "distinct delineations of English domestic life, with a delicate discrimination of female character." Her own opinion was that one of her novels was "a little bit of ivory two inches wide," on which she "worked with a brush so fine as to produce little effect after much labor." Her life has been written by J. E. Austen-Leigh (London, 1871).

AUSTERLITZ, a town of Moravia, in the circle and 12 m. E. of Brunn on the Littawa river; pop. about 2,400. It owes its celebrity to the battle won here by Napoleon over the united Austrian and Russian armies, Dec. 2, 1805. After the capture of the Austrian general Mack at Ulm, Oct. 17, and the occupation of Vienna by the French, Nov. 18, the Austrian

and Russian forces were concentrated near Olmütz, and under command of the czar advanced upon Napoleon, whose forces were ranged in a semicircle having its centre near Brünn. The allies chose their position wrongly; and Napoleon, perceiving their error, ordered an instant attack, and routed them after a most severe contest. The allies lost about 30,000 killed, wounded, and prisoners. Austria was compelled to make the peace of Presburg; the emperor of Russia to return to his dominions; and the campaign ended leaving a large part of central Europe subject to Napoleon. The news of this disastrous battle is said to have hastened the death of William Pitt.

AUSTIN, a S. E. county of Texas, intersected by Brazos river; area, 1,024 sq. m.; pop. in 1870, 15,087, of whom 6,574 were colored. The Texas Central railroad passes through the county. Stock-raising is carried on to a large extent. Timber is abundant. In 1870 the county produced 444,544 bushels of Indian corn, 65,745 of sweet potatoes, 11,967 bales of cotton, and 19,302 lbs. of wool. There were 60,058 cattle, 5,768 horses, 7,554 sheep, and 15,657 hogs. Capital, Bellville.

AUSTIN, a city of Texas, capital of the state and of Travis county, on the Colorado river, 160 m. (direct) from its mouth, and 200 m. N. W. of Galveston; pop. in 1860, 3,494; in 1870, 4,428, of whom 1,615 were colored. The Colorado is navigable to this point in winter by steamboats. Austin is built on an amphitheatre of hills, and overlooks the valley of the Colorado and the rich prairies beyond. The public buildings are of a white stone called marble, but too soft to admit of polish. An artesian well has been sunk just north of the capitol, to the depth of 1,300 feet, from which a small stream constantly issues. The water is impregnated with lime, and has some medicinal qualities. It has been proposed to supply the city with water from the Colorado by an aqueduct. There are 8 or 10 churches in the city, and about 20 schools. The first free public schools in Texas were opened at Austin in 1871. There are 2 weekly newspapers published here, 1 tri-weekly, and 3 daily. The western division of the Houston and Texas Central railroad connects the city by way of Hempstead with Houston and the diverging railroads.

AUSTIN, Jonathan Loring, secretary and treasurer of Massachusetts, born in Boston, Jan. 2, 1748, died May 10, 1826. He graduated at Harvard college in 1766, was a merchant and secretary of the board of war in Massachusetts, and in 1777 was sent to Paris to the American commissioners with the news of Burgoyne's capture. Dr. Franklin made him an additional private secretary, and sent him as his agent to England, where he resided in the family of Lord Shelburne. On his return with despatches in May, 1779, he was liberally rewarded by congress. In 1780, in his passage to Spain as agent of the state, he was taken and carried, to England, but soon liberated.

He was afterward state secretary and treasurer of Massachusetts.

AUSTIN, Moses, an American pioneer, born in Durham, Conn., died June 10, 1821. He led an adventurous life, engaged in lead-mining in Virginia and Missouri, and in 1820 went to Bexar, Texas, where he obtained from the Mexican authorities permission to colonize 300 families in some part of Texas. He died soon after, and the plan was carried out by his son. (See **AUSTIN, STEPHEN F.**)

AUSTIN, Samuel, D. D., an American clergyman, born at New Haven, Conn., Oct. 7, 1760, died at Glastenbury, Dec. 4, 1830. He graduated at Yale college in 1783, and, after studying divinity two years, was ordained as pastor of the church in Fairhaven, Conn. In 1790 he became the minister of the first Congregational society in Worcester, and in 1815 president of the university of Vermont. After holding that office for six years, he removed to Newport, R. I., and thence at the end of four years returned to Worcester. During the last three years of his life his reason was clouded. He left several controversial and other works.

AUSTIN, Sarah, an English authoress, born in 1793, died at Weybridge, Aug. 8, 1867. She was one of the famous Taylor family of Norwich, and the wife of Mr. John Austin, a London barrister. Her reputation rests upon the unusual ability of her translations from German authors. Her first and most remarkable achievement in this kind was her version of the travels of Prince Pückler-Muskau, published under the title of "The Travels of a German Prince in England." The idiomatic painting and fluent ease of this translation were so admirable that for a long time it was difficult to persuade many persons that the work was not the composition of an English author. The first work which Mrs. Austin gave to the world under her own name was a translation of Falk's "Characteristics of Goethe" (1833), with many additions by herself. This book won an immediate and deserved success. She afterward published translations of Carové's "Story without an End," and Ranke's "History of the Popes," a "Collection of Fragments from the German Prose Writers," an excellent treatise on "Education," and "Sketches of Germany from 1760 to 1814."

AUSTIN, Stephen F., founder of the first American colony in Texas, son of Moses Austin, died Dec. 27, 1836. Setting out from Natchitoches, July 5, 1821, to follow up the grant previously issued to his father authorizing the formation of a colony, he went to the city of Mexico, where it was specially confirmed Feb. 18, 1823. By it he was clothed with almost absolute power over the colonists, and only obliged to report to the captain general. The colony, since become Austin, the capital of Texas, of which he selected the site after a careful reconnoitring of the country, had been previously organized by him upon the basis of giving to each man 640 acres of land, 320 for a

wife, 160 for each child, and 80 acres for each slave; and the immigrants being made up in great part of young unmarried men, he induced them to unite in pairs, making one of them the head of the family thus constituted, which singular arrangement is said to have resulted to the satisfaction of all concerned. In spite of frequent trouble with the Indians, the colony prospered, and, being followed by a considerable number of similar associations, the influx of Americans was so large that they met March 1, 1838, without the concurrence of the Mexican population, in a convention to form a constitution for the as yet Mexican state of Texas. Austin was one of the delegates chosen to carry the result of their deliberations to the central government at Mexico, and obtain its ratification. The delays and frequent revolutions at Mexico leading him to despair of success in his mission, he addressed a letter to the people of Texas, recommending a union of all the municipalities to organize a state. For this he was arrested and kept in prison three months, until released by Santa Anna, who continued to hold him as a sort of hostage. In September, 1835, he returned to Texas, took part with the revolutionary party, which had been forming in his absence, and was put in command of their little army. His first act was to send into eastern Texas for Gen. Houston, who was soon elected to the chief command, Austin being appointed a commissioner to the United States. Here he acted with prudence, and was very successful in preparing the public mind for the independence and annexation of the new republic. After spending some time in advocating this measure, he returned to Texas in July, 1836; and he died while still engaged in negotiations.

AUSTIN, WILLIAM (BILLY), the reputed natural son of Queen Caroline. He was known as a poor lad of Deptford, near London, who bore a striking resemblance to the queen; and though her majesty was judicially acquitted in 1808 of the charge of being his mother, she insisted upon keeping him near her person. In 1830 he was sent to a lunatic asylum at Milan, and remained there till 1845. Being then brought back to England and subjected to a medical examination at the request of his guardians, the Right Hon. S. Lushington and Sir J. P. Wilde, he was transferred to a private asylum in London.

AUSTRALASIA (South Asia), the S. W. division of Oceania, extending from the equator to lat. 47° S., and from about lon. 112° to about 170° E. It embraces Australia, Tasmania or Van Diemen's Land, New Zealand, and Chatham isle, on the west and south; Papua, the Admiralty isles, New Ireland, and the Solomons archipelago on the north; Queen Charlotte's isles, the New Hebrides, and New Caledonia, on the east; and all the interjacent islands. On account of the black color of its natives, Australasia is also called Melanesia, chiefly by French geographers. (See OCEANIA.)

AUSTRALIA, formerly called **NEW HOLLAND**, an island, classed as a continent by most geographers, lying S. E. of Asia and the Sunda islands, between the Indian and the Southern Pacific oceans, and extending from lat. 10° 43' to 39° 9' S., and from lon. 118° to 158° E. From its western extremity, Steep point, to its extreme eastern point, Cape Byron, its length is 2,500 m.; and its breadth, from Cape York, its northernmost point, to its southern extremity at Cape Wilson, is 1,900 m. Its entire coast line embraces a circuit of 8,000 m., and its area is estimated at 8,000,000 sq. m. The configuration of the Australian coast displays little irregularity; there are but two or three large peninsulas, and although small bays are found along almost the whole coast line, the gulf of Carpentaria, and the large inlet leading to Cambridge gulf and Queen's channel on the north, and Spencer and St. Vincent gulfs on the south, are the only deep indentations. A long curve of the southern coast forms the vast bay called the Great Australian bight, but this is only a portion of the open ocean.—From the N. E. extremity of the continent, where the long, triangular peninsula of York lies between the gulf of Carpentaria and the Pacific, its northern extremity only separated from New Guinea by the narrow Torres strait, the coast trends southeastward for more than 1,400 m. to Cape Byron, where its direction suddenly changes to southwest. Along the greater part of this N. E. stretch of coast, from Cape York nearly to the Great Sandy island, lie the Great Barrier reefs, the most extensive range of coral reefs known in the world. Frequent though often dangerous passages through this barrier permit the entrance of vessels into the sea lying between it and the mainland, a body of water varying in breadth from its southern entrance, where it is a broad open sea, the reefs lying at a great distance from the coast, to its central point at Cape Tribulation, where it hardly affords even a passage. Further N. it again stretches away from the coast, extending across the E. end of Torres strait. Near the southern entrance of the sea thus enclosed, and a little N. of Sandy island, are numerous good harbors. The coast is here made up of high and precipitous cliffs, and this formation continues to characterize its whole extent, as far as its southern extremity, with the exception of a small portion S. of Cape Howe. Below Cape Byron, where it trends to the southwest, it contains some of the best harbors in the world, chief among them that of Port Jackson at Sydney. The S. coast, from Cape Wilson W. to the beginning of the Great Australian bight, is also celebrated for its excellent harbors; only a short strip of coast E. of Encounter bay is without good shelter. But with the Australian bight begins a long uniform line of cliffs without refuge of any kind for vessels, steep and rugged, and continuing W. as far as the Recherche archipelago. West of this are a few safe ports. The W. and N. W. coasts are the least

favorable of all to navigators; they are generally destitute of harbors, only a few really useful ones being found near the Buccaneer archipelago. The N. W. coast is high and rocky, the western low and sandy. The N. coast, made most irregular of all by the two peninsulas of Arnhem Land and York, and by the gulf of Carpentaria, has in its western part some of the best harbors of the continent, though they are not as well known as the southern ports. The gulf of Carpentaria itself has a sandy, low, and dangerous E. coast, but its western side has numerous sheltered bays and safe navigation. That portion of the Indian ocean which washes this coast, extending between New Guinea and Australia to the Torres strait, is called the Arafura sea.—The interior has been only partially explored. It seems to have the character of a table land of moderate height studded with groups of small mountains, and in the interior sometimes sinking into low swampy valleys; while on the general level of the table land itself are vast plains, sometimes fertile, but oftener sandy, or covered with the long stiff grass called spinifex. There are many swamps, but few ponds or useful watercourses. Large desert tracts, covered with stones or low shrubbery, are frequently found. Near the coasts, however, greater and sometimes luxuriant fertility prevails, and here the varied surface of the country displays some of the most beautiful scenery in the world. The south-eastern and eastern portions of Australia are all that have thus far been thoroughly and scientifically explored. Along the whole E. side of the continent lie ranges of mountains of considerable height, sometimes actually touching the coast, but generally in their southern portion lying at an average distance of 40 to 50 m. from it, while in the north they are still more distant. These are often considered as a single range, but are more correctly divided into several distinct portions. The Australian Pyrenees and the Grampian Hills, which run parallel to the S. coast E. and W. of Melbourne, may be considered a western offshoot from the southern extremity of this system. Their summits are generally low, but in two or three places near their junction with the principal range they attain a height of between 5,500 and 6,000 ft. The first of the main chain of the E. coast, beginning at Cape Wilson, are the highest mountains of the country, the Australian Alps, having their principal peaks, according to Petermann's map of 1872, in Mt. Kosciuszko, 7,176 ft. high, the loftiest peak yet discovered in Australia, and Mt. Hotham, 6,414 ft. In the neighborhood of these mountains lies the grandest scenery of the continent. Ragged cliffs of great height, crowned with forests, hem in the fertile valley of the Murray river, which has its source in this range. These rugged Alpine features characterize the entire chain, and the smaller parallel ranges and offshoots are scarcely less picturesque. N. of the Australian Alps and W. of Sydney are the Blue moun-

tains, the next group in the chain. They nowhere reach a greater height than 4,100 ft., but the same wild scenery prevails through their whole extent. N. of these again lies the Liverpool range, trending toward the east, where the somewhat isolated Mt. Sea View rises to the height of 6,000 ft., and lying almost at right angles to the general direction of the system. W. of the Blue mountains are two other chains, offshoots of the main formation—the Honeysuckle range and the Canobolas group, the latter of greater height than any peaks of the Blue mountains themselves. N. of the Liverpool range the mountains become more scattered, extending E. and W., and no longer preserving the narrow and regular line their principal peaks have heretofore kept. In this irregular mountain region the principal summit is Mt. Lindsay, S. W. of Brisbane, 5,700 ft. high. From this point the same wide and irregular formation extends to the north, at least into York peninsula, and probably even to its extremity. It appears, from such explorations as have been made, to attain its greatest height in the S. E. part of the peninsula. Along the S. coast, near the head of Spencer gulf, are low chains of mountains little more than 3,000 ft. high. The Darling, Herschel, and Victoria ranges, which have been discovered on the S. W. coast, have seldom a height of more than 2,000 ft. One peak, however, Mt. Bruce, near King George's sound, is a little more than 3,100 ft. high. No considerable mountains have been discovered in the interior of the continent.—Very few of the rivers of Australia are navigable, and in most of them running water is only found during a small portion of the year. The most remarkable peculiarity of these streams is the suddenness with which, even when full of water, they disappear into a quicksand or marsh. Thus, although these creeks and rivers are almost innumerable, they fail to irrigate the soil. Only a few exceptions to this rule are found. Among these the chief is the Murray or Goolwa, which rises in the Australian Alps, and flows about W. N. W. for more than 500 m., when, by a sharp turn in its course, called the Great Bend of the Murray, it changes direction to the S., and empties 100 m. further into Lake Alexandrina, a basin connected with the sea. The Murray and its tributaries, the Murrumbidgee and Lachlan, are lasting streams; but of its other tributaries there are none which do not become partially dry in the summer. Even the Darling, a river of considerable size flowing into the Murray from the north, shares this peculiarity. The other permanent streams of Australia are short and of comparatively little importance; the best known are those which flow from the coast ranges directly into the sea. Among them are the Hawkesbury, Hunter, Clarence, Brisbane, Fitzroy, and Burdekin, on the eastern coast; the Glenelg, Hopkins, Yarra-Yarra, and others, on the southern; the Swan, Murchison, Gascoyne, and Fortescue, on

the western; and on the northern, the Victoria, Alligator, Roper, and Flinders. The lakes of Australia consist, during the greater part of the year, of swamps full of weeds and grass, or of mere beds of mud or sand. This applies even to the largest inland bodies of water yet discovered, which lie grouped together near the centre of the S. coast, N. of Spencer gulf. Here is Lake Torrens, about 140 m. in length, but very narrow, lying about 40 m. from the head of the gulf; and 50 m. further N., Eyre lake, still larger. E. of this is Lake Gregory, which might be more correctly called Gregory lakes, since it is divided into numerous parts, between which no considerable communication has been discovered. W. of Lake Torrens lies the extensive Lake Gairdner, and E. of it Lake Frome. The water of this group of lakes contains a large proportion of salt, and salt also abounds in the marshes and innumerable swampy ponds which lie in this region.—The geological structure of Australia has not been thoroughly ascertained. It appears, however, that the main table land rests on tertiary sandstone, directly overlying the primary rocks, the fact that no traces of a secondary formation have been found forming one of the most remarkable features of Australian geology. The mountains rising from the table land in the interior are, on the contrary, generally of volcanic structure. In the range of the S. W. coast primary rocks are most prominent—granite, syenite, &c.; and all the greater coast ranges probably resemble these. In several of the great valleys in the S. E. part is found a limestone containing numerous fossils. Bituminous coal is abundant near Newcastle at the mouth of Hunter river in the eastern part of New South Wales, and large mines are already worked there. Rich deposits of copper are also found at Burra-Burra, Wallaroo, and Kapunda in South Australia—that at Burra-Burra being probably the richest in the world. The famous gold fields are in the Bathurst district and the N. W. part of Victoria. Every indication shows that only in the latest geological period has Australia risen from the sea. The recent deposits following directly on the primary rocks, the salt lakes, the whole construction of the continent, indicate this; and geologists affirm that the southern coast is still in process of imperceptible but constant upheaval.—The climate of Australia is exceedingly hot, but dry and healthy in such southern parts as are already colonized, where it appears favorable to European constitutions, and resembles in many particulars the climate of Spain. In the extreme north, beyond the tropic of Capricorn, which crosses the continent near its centre, the heat is more oppressive, and the absence of large streams gives almost the arid climate of a desert. Here, however, the tropical rainy season brings relief with un-failing regularity, lasting from November till April; while in the south the rains, though of tropical violence, are irregular, occurring at

intervals between March and September, and often leaving the country exposed to long droughts. There appears to be almost no rain in certain portions of the central continent, and these have become deserts, from which hot winds blow toward the coast, carrying clouds of sand. Extraordinary variations of temperature are among the most remarkable phenomena of the country. Falls in the mercury of 20° to 30° F. in half an hour are common on the coast, especially in the summer; and comparing the reading of the thermometer in the sun at noon with the same at midnight, a variation of 99° in the 12 hours has been observed. The average height of the thermometer for the year on the N. coast is about 80°; at Port Macquarie on the E. coast, 68°; at Port Jackson (Sydney), 66°; at Melbourne, on the S. coast, 61°; at Perth, on the W. coast, 64°. In summer, however, the mercury often rises to 100°, or even 120°. One traveller (William Howitt) has even stated his experience at 139°.—The animals of Australia are peculiar, not less in themselves than in their distribution. The carnivora are few, and the only really destructive beast of prey is the dingo, an animal in size between a fox and a wolf, and resembling a dog. The dingoes roam about in packs and attack sheep, killing and wounding many, but eating few. Ruminating animals and pachyderms are unknown. But while Australia is thus deficient in the classes of animals most abundant in other parts of the world, its fauna consists very largely of a class elsewhere but sparingly represented—the *marsupialia* or pouched animals. Of these the largest and perhaps the most common is the kangaroo. A smaller species of this animal is called the wallaby. The opossum, the *petaurus* or flying opossum, and the *dasyurus* (a carnivorous pouched animal) are the other species most frequently met with. Another peculiar family inhabiting Australia are the monotremata, including the two curious species *echidna*, or porcupine ant-eater, and *ornithorhynchus*. The latter species is a water animal shaped like a beaver, but has web feet, a bill like that of a duck, and in the case of the male spurs upon the hind feet. (See *MONOTREMATA*.) There are five species of rodents, four small and insignificant, and one somewhat larger and resembling the beaver in its habits. The birds include several of the largest species of eagles, falcons, and owls. Parrots of the most brilliant plumage, birds of paradise, and orioles are abundant; while among the peculiar birds are the emu, the black swan, the ibis, and the “laughing jackass” or “bushman’s clock,” a large kingfisher, with a remarkable voice. The marine animals include the dugong, found along the northern shore between Moreton bay and Cape York. Sharks abound on all the coasts. The amphibious animals are few and small. Few of the serpents are venomous, and none are of great size. The insects, however, include several species whose

bite is poisonous—the scorpion, centipede, and several kinds of spiders. Ants of all sizes abound; some are found an inch long, living in immense hills, and really formidable from their swarming attack and painful bite.—It is said that nine tenths of the 8,000 species of plants found in Australia are unknown elsewhere, and are entirely unconnected with the forms of vegetation of any other division of the world. The great majority of these belong to two genera, the *eucalypti* (a genus of the myrtle family) and the acacias. Of the former more than 100 varieties are known, spread over the whole continent. Many of the trees of this genus attain the height of 200 ft., with a girth at the base of 30 or 40 ft. Of the acacias, too, more than 100 species have been discovered. Cedars and casuarina are the chief representatives of the coniferæ. *Xanthorrhææ* are abundant, and near the coast grow to a height of 300 ft., the principal kind being called by the colonists the black boy or grass gum tree. Only a few palms are found. The principal Australian trees, the eucalypti and many of the acacias, have some remarkable peculiarities. Both have their leaves perpendicular to the surface of the earth—the edges of the leaves turned toward the ground instead of their flat sides. Many of the eucalypti shed their bark, but their leaves do not change, remaining green and on the tree through the whole year. Among the other curiosities of the Australian flora are the arborescent ferns, which attain the perfection of trees, putting forth branches eight to twelve feet long; the giant lily (*dory-anthemum*), an object of great beauty; the tea tree (*leptospermum grandiflorum*); and the remarkable stench plant (*hydrocotyle densiflora*). In the interior of the continent the giant kangaroo grass, so high as to conceal cattle, or even a horse and rider, is found covering great plains; while the more sterile tracts are covered with the hard, sharp spinifex (*triodia pungens*). The brilliant flowers of Australia have little fragrance, but the leaves of several kinds of trees are highly aromatic.—Though the continent has few indigenous fruits or useful vegetable products, nearly all those of other countries thrive in its climate. On the N. E. coast, in the Moreton Bay settlement, the Japanese loquat, the date palm, and the prickly pear, cotton, sugar, coffee, and tobacco have been naturalized; while bananas, oranges, and lemons grow here, as well as on the W. coast. In New South Wales, Victoria, and South Australia, the cereals flourish with unsurpassed productiveness, and 64 lbs. to the bushel has been produced in Australian wheat. All kinds of garden produce are of superior character; almonds, figs, apricots, melons, grapes, quinces, apples, pears, and plums are produced in great quantities.—The mineral wealth of Australia, even if we consider only that portion already developed, is remarkable. It has been known from very early times to possess iron and other minerals. The gold ex-

isting in pure masses does not seem to depend on stratification, but has probably been upheaved along with other matter, and washed down by surface or subterranean currents. All that can be safely predicated of the materials in company with which gold is found, is that quartz and pipe clay are very generally associated with it. The quartz is abundant, and is found from minute pebbles worn smooth by attrition to huge blocks of many tons' weight which crop out from the surface in irregular and fantastic forms. It is usually milk-white and opaque, but occasionally attains a semi-crystalline transparency. Besides this, however, gold is found intermixed with sandstone, ironstone, and white and blue clay. The range over which gold extends is altogether undetermined. Recent accounts announce its discovery at the furthest limits of exploration. The profitable diggings have until recently been confined to the Bathurst district, in the north of New South Wales, and to the hill country in the north and northwest of Victoria; but the new diggings in Queensland, especially at Gympie, are yielding very richly. In minute portions gold has been found all over the colonies. It was at first met with in small pieces on the actual surface; as the surface supply became exhausted, it was found at a short distance down, and the diggings have increased in depth as they have decreased in general richness. At Ballarat, near Geelong, where the most valuable lumps of gold have been procured (28, 60, and 136 lbs. in weight), the shafts are sunk to a depth of more than 100 feet. The gold has never been found otherwise than in detached pieces or particles, varying in size from minute globules to weighty masses; and where its close contiguity has assumed the character of a vein, it is only that the deposit has been washed together into a subterranean channel or gutter. The copper mines of Burra-Burra and other localities, and the coal deposits in various quarters, have already been referred to. Tin, lead, silver, and precious stones of various kinds have also been discovered in the search for gold, and passed over for the present.—The aborigines of Australia are of a distinct race from that inhabiting the Indian archipelago. They are found only in the Australian islands, in New Guinea, the New Hebrides, New Caledonia, and the Solomon islands. The New Zealanders are akin to the inhabitants of Polynesia. The Australians are black, with some slight variety of shade from brown-black to jet. They have curly hair, but not the crisp wool of the negro. Their faces are well developed, broad at the base, their lips less protruding than those of the negro; their bodies are deficient in muscularity and strength, but capable of great endurance. They are superior in native intelligence to the Tierra del Fuegians, and they readily adopt European habits. They seldom build huts or other fixed dwellings, but content themselves with a strip of bark or a large bough as a

shelter from the wind. Whether they knew the use of fire is uncertain; they now kindle fires by rubbing two dry sticks together. But

Australian Man and Woman. (From Photographs.)

they frequently eat their food raw, and their cooking is performed by making a hole in the ground, lighting a fire in it, putting in the slain animal, and covering it with earth until the fire is out, when it is considered sufficiently cooked. In the wild districts they go entirely naked; in the vicinity of settlements they wear sheepskins, or the blankets and clothing distributed to them by the settlers. They have not the use of the bow, but are expert with the spear, which they fling 70 or 80 yards with the greatest nicety. They use the club or waddy; and they have the boomerang, a

distance and rebounds toward the thrower. The several tribes are engaged in frequent feuds with each other, but are not usually courageous in the presence of the whites. In the early times of the colony, however, they frequently exhibited great pertinacity in their attacks on out-stations. Their temper is generally pacific and friendly. Their numbers are very limited; the highest recent estimate is 50,000, and even this is probably much over the mark. The use of ardent spirits has made great ravages among them. They are subject to cutaneous diseases, attributable to their extremely filthy habits. They are polygamists, and their marriages are entirely without ceremony, the bridegroom merely carrying away the bride, with or without her consent. Their burials, on the contrary, are accompanied by certain superstitious observances; the dead are buried in the exact places in which they died, and these spots are never inhabited again by members of the dead men's tribe. The names of the dead are never pronounced, and those bearing the same names are obliged to change them. Their religious opinions are simple; they believe in a good and a bad spirit. They believe that white men are the reanimated souls of blacks. Many efforts for their conversion to Christianity have been made, but without permanent success. All the colonial governments keep up native schools. In New South Wales a black police was at one time formed, whose services were very valuable in tracking depredators, from their native skill in following a trail. Some few of the blacks are occasionally employed as stockmen or shepherds; but they are, like all savages, averse to regular labor of any kind. They are rapidly decreasing in number, and in a few decades will probably be almost extinct.—The political divisions of Australia, the dates of their official organization as colonies, their areas (chiefly estimated), and their population in 1871, are as follows:

DIVISIONS.	Date of Organization.	Area in square miles.	Population in 1871.
New South Wales.....	1788	328,487	501,611
Victoria	1851	66,381	129,868
South Australia	1836	368,828	184,996
Queensland	1859	678,000	115,567
Western Australia	1829	978,000	24,755
Northern Territory (not yet organized)	528,581	201
Total		2,978,127	1,561,027

The rapid growth of the colonies may be seen from the fact that New South Wales in 1821 only numbered 29,788 inhabitants; Victoria in 1836, 224; South Australia in 1838, 6,000. The majority of the inhabitants of each colony are of British descent; the number of natives of Germany is 9,000 in New South Wales, with a smaller number in the other colonies. The number of Chinese is about 70,000 (17,000 in Victoria), and it is steadily increasing. The

Aboriginal Shelters.

peculiar missile, resembling a double-edged wooden sword, bent to an ellipse; on being thrown into the air it strikes the ground at a

largest cities and towns of Australia are Melbourne (Victoria), pop. 190,000; Sydney (New South Wales), 135,000; Ballarat (Victoria), 74,000; Sandhurst (Victoria), 84,000; Adelaide (South Australia), 27,000; and Geelong (Victoria), 22,000.—In the early days of the Australian colonies clergymen were merely chaplains to the convict establishments. Subsequently an act was passed for the support of Episcopal churches and schools, to which one seventh of the crown lands was to be devoted. Sir Richard Bourke prevailed upon the English government to assist all denominations of Christians in building places of worship and supporting their ministers. In Queensland an act was passed in 1860 abolishing state aid to religion altogether, and the other colonies are likewise more or less approaching the voluntary system. Thus the most populous colony, Victoria, has reduced the state aid to an annual subsidy of £50,000. The number of Roman Catholics in 1871 was estimated at 250,000; of Jews, 5,500; of Mohammedans and pagans, about 42,000. A few thousand belong to no religion; the remainder are Protestants, more than one half being connected with the church of England. This church has nine bishops, namely, of Sydney, Newcastle, Bathurst, Adelaide, Melbourne, Perth, Brisbane, Goulburn, and Grafton and Armidale. The Roman Catholic church in 1871 had one archbishop (in Sydney) and ten bishops.—The cause of education has made great progress. Each of the colonies has its board or council of education, consisting of a number of members appointed by the government. The system of public education is more or less assimilated to the national system in Ireland. The government provides, under conditions which differ in the several colonies, for the establishment of common schools, and also grants aid to schools not established by the government on their complying with certain regulations. The state also assists the formation and maintenance of educational establishments of a more advanced character. In several colonies education has been made compulsory. In 1871 the number of schools under the control of the government boards amounted to about 3,640, with 255,000 pupils under 6,600 teachers. Nearly all the colleges, of which there are many, bear a denominational character. Sydney and Melbourne have universities.—The revenues of the colonies are chiefly derived from duties, public lands, the post office, railroads and telegraphs, stamp duties, and licenses. The public debts have been chiefly contracted for the establishment of railroads,

ports, and other public works. The foregoing table exhibits the revenue, expenditures, and public debt of each of the colonies in 1870. —Gold still constitutes the chief article of export. The aggregate value of precious metals exported from Australia amounted in 1869 to £10,870,000. Next to gold the most important article of export is wool, the value of which in 1869 was estimated at £8,161,000. South Australia exports large quantities of wheat (£866,870 in 1869) and copper (£622,681). The breeding of cattle has become an important occupation of the colonists. The colonies had in 1871 about 22,100,000 sheep, 2,600,000 horned cattle, and 732,000 horses. The following table exhibits the imports and exports of the colonies in 1870:

COLONIES.	Imports.	Exports.
New South Wales.....	£7,757,281	£7,991,088
Victoria.....	12,458,757	12,470,014
South Australia.....	2,029,798	2,419,487
Western Australia.....	232,590	204,447
Queensland.....	1,586,799	2,006,685
Total.....	£24,010,220	£25,091,621

The merchant navy of the colonies consisted on Jan. 1, 1871, of 1,192 vessels, with an aggregate of 169,000 tons. The entries and clearances in the Australian ports in 1869 represented an aggregate of 3,774,909 tons. All the colonies had railroads at the close of 1871, with the exception of Western Australia, where their introduction was expected at an early date. The greatest progress in this respect has been made in New South Wales, which in 1871 had 431 m. of railroads. The aggregate length of the Australian railroads at the close of 1871 was about 1,110 m., and a very considerable extension of the railroad system was about taking place in several colonies. The electric telegraph has been introduced into each of the colonies. The length of the wires in 1871 was 5,058 m. in New South Wales, 3,368 in Victoria, and about 13,400 in all the colonies. All the colonies except Western Australia are connected with each other by telegraph, and since 1869 by a submarine cable with Tasmania. Telegraphic connection between Australia and England, by means of a submarine cable connecting Java and Port Darwin, was nearly completed at the beginning of 1872. The government in each colony consists of a governor appointed in England, a legislative council, and a legislative assembly elected by universal suffrage.—Australia first became known to Europeans in the beginning of the 17th century. Though a vague outline of land in this portion of the southern ocean appears upon the map of some Portuguese navigators dated 1542, the first real discovery was probably made by the Dutch in 1606, when the captain of the yacht Duyfken, sent out from Bantam to explore a part of the coast of New Guinea, saw the northern shore of the continent at a distance. In the same

* 1869.

year Torres strait was named from a Portuguese navigator who sailed through it. In 1616 Hartog, a Dutch captain, came upon the W. coast of Australia and called it Endracht's Land, from the name of his ship. From this time other parts of the W. coast were discovered. In 1622 the Leeuwin discovered the S. coast at Cape Leeuwin, and shortly after Van Nuyts sailed from that cape on the S. coast to Spencer's gulf. De Witt's Land and Carpentaria, in North Australia, were also discovered by Dutch traders. Capt. Cook in 1770 discovered New South Wales and Botany Bay, which was so called by Sir Joseph Banks, the botanist of the expedition, from the wonderful floral display which its plains afforded. In 1788 the first English colony was established in New South Wales, at first as a penal settlement. The original design of the British government was to make this penal station at Botany Bay itself; but a better locality was found at Sydney, and Capt. Phillip was sent out with a squadron having on board 850 convicts and a guard of 200 men and officers. In this convict colony, placed as it was under the absolute control of a governor with almost unlimited power, every kind of abuse and vice grew up; and of these the free colonists who afterward began to settle in the district felt the effects in many ways. A conflict grew up between them and the government on the question of abolishing the transportation system; and after endeavoring, under a long succession of governors, to devise some means of keeping up the two plans of a convict colony and a free colony together, the government was obliged to yield, principally by the efforts of the "Anti-Transportation League" formed against its measures, and to issue an order in council in 1837 abolishing transportation to New South Wales, and restricting it to Van Diemen's Land; even here it was abolished in 1853. From this time the attention of the English was more and more attracted toward Australia, and explorations of the other coasts and even of the interior followed in rapid succession. In 1798 and 1799 Flinders and Bass, two Englishmen, carefully surveyed the S. and E. coasts. In 1800-'1 Grant and Murray explored the western part of the S. coast, and their work was continued both to the eastward and northward during the next three years by Baudin, Freycinet, and Flinders. During the period from 1788 to 1791, explorations in the interior were also undertaken by Phillip, Tench, and Dawes. In 1796 Hunter penetrated to the mountains called by his name. In 1813 Wentworth, Blaxland, and Lawson crossed the Blue mountain and discovered the Bathurst plains, which in 1815 became the seat of a branch colony. In the same year Evans explored the valley of the Lachlan. In the succeeding five years Jefferies, Kelly, and King completed the survey of the coasts. Oxley, who travelled through the eastern mountain system in 1818, Hovell and Hume, who explored the region of

the Australian Alps from 1818 to 1824, and Cunningham, who spent the six years from 1823 to 1829 in the northern part of the same district, were the next noteworthy explorers. In 1828 and the years following Sturt made several expeditions of importance, and in 1839 he discovered the Darling river. In 1829 also was founded the second of the chief colonies—that which still bears the name of Western Australia. The first settlement was at Perth. In 1832 Bennett, and in 1835 and the succeeding year Major Mitchel, explored southern Australia, and the latter followed the Darling to its confluence with the Murray, besides discovering the Grampian hills, and making other noteworthy additions to the knowledge of the interior. In 1835 also the first settlement in the future colony of Victoria was made at Port Phillip. In the mean time several attempts to colonize other parts of the coast had failed: a settlement had been made in Arnheim's Land in 1824, and several others in subsequent years on the W. side of the island, but none of these endured more than a few years. In 1836, however, a successful colony was begun in South Australia, at Adelaide. In 1839 and the three following years Stokes made a series of important exploring expeditions along the coast. The interior, chiefly between the Pacific and the gulfs of Carpentaria and Spencer, was explored in the following three decades by those of Eyre, Leichhardt, Sturt, the brothers Gregory and Helpman, Kennedy, Austin, Stuart, Babbage, the brothers Dempster, Burke and Wills, Landsborough, McKinlay, Lefroy, McIntyre, Forrest, Brown, and others, several of whom became the victims of their zeal and boldness. Emigration to the newly founded colonies was very slow; large numbers of discouraged settlers left Australia for the South American coast or for other countries; and in 1850, after all the attempts made during 60 years of colonization, the European population was estimated at only 50,000. An event now occurred which suddenly changed the whole condition and prospects of the continent. This was the discovery of gold in 1851, in the Bathurst district of New South Wales, by a gentleman returned from California, Mr. Hargreaves. Count Strzelecki had previously announced the existence of gold in Australia, and Sir Roderick Murchison, examining a piece of Australian quartz, had inferred it from his knowledge of the gold washings in the Ural mountains. The discovery of gold in quantities on the Turon river, in New South Wales, early in the year, first drew a number of diggers to that district. In the latter end of 1851, however, diggings of far greater value were discovered in Victoria, and then commenced an influx of immigrants which, as in the case of California, produced results that set all foresight and calculation at defiance. In a year after the discovery the population was 250,000, notwithstanding the distance from Europe and the expense of the voyage. Ordinary busi-

ness of all kinds was momentarily suspended. Agriculture was for that year almost abandoned. Every article of food and clothing was imported from Europe, labor and merchandise advanced to prices to which there seemed to be no probability of a limit, and much time was required to bring Australian affairs into their ordinary channel. Among the industries which have grown up, the raising of sheep has the most prominent place. The great sheep runs, occupying immense tracts of land, have become a principal feature of the country. Merino and other fine breeds, imported early into the colonies, have increased with great rapidity—in Queensland alone from three to nine million head in the last ten years—and the statistics show the extraordinary amount of wool annually yielded, and nearly all exported.—The recent progress of the country has been uninterrupted and rapid. The era of speculation seems to have nearly passed away, and the affairs of the colonies are gradually assuming the settled aspect of those of older states. Explorations are constantly made in the interior, and the large tracts still unsettled near the coast are attracting a considerable immigration, which, now that the resources of the continent are properly developed, is not likely to be discontinued.—For more specific information, see the articles on the different colonies.

AUSTRASIA (old Ger. *Oesterrych*, i. e., *Oestreich*), the eastern kingdom of the Franks of the 6th, 7th, and 8th centuries, under the Merovingians, comprising in its flourishing period the countries on both sides of the Rhine, from the Marne to the Saale and from the North sea to the Danube (the ancient kingdoms or duchies of Metz, Champagne, Thuringia, Alemannia, Frisia, and others). The first king was Siegbert, to whom this territory fell in 561 on the partition of the dominions of his father Clotaire I., king of the Franks. Austrasia was in conflict with Neustria, the western Frankish kingdom, and with the Burgundians. Among celebrated Austrasian rulers were Queen Brunehaut or Brunehilde (567–613), King Dagobert (628–'38), whose successors are called *les rois fainéants* (idle kings), and the mayor of the palace Pepin of Herstal, who was succeeded in 714 by his natural son Charles Martel. In 752 Charles's son Pepin the Short became sovereign of both the eastern and western Frankish kingdoms, and Austrasia ceased to play a distinct part in history. Under Charlemagne's successors most of the former Austrasian countries were merged into Germany, and those of Neustria into France.—See *Histoire du royaume mérovingien d'Austrasie*, by Haguenin (Paris, 1863).

AUSTRIA (Ger. *Oestreich* or *Oesterreich*, eastern empire), officially designated since 1868 as the **AUSTRO-HUNGARIAN MONARCHY**, an empire of southern central Europe, bounded N. by the German empire and Russia, E. by Russia and European Turkey, S. and S. W. by Turkey, the

Adriatic sea, and Italy, and W. by Switzerland and the German empire. It now consists of two main divisions, Austria proper and Hungary, each of which has its own special legislation and administration, though they are united under one monarch and have a single ministry for all matters of common interest. As the river Leitha constitutes a part of the frontier, Austria is also called Cisleithania, and Hungary Transleithania. But while in the higher political sense the Austro-Hungarian monarchy consists of these two divisions, the term is in fact the collective designation of several states, comprising a number of distinct nationalities, all under the rule of the house of Hapsburg. It is only since the accession to the throne of the emperor Francis Joseph that these countries have been actually consolidated. The centralizing policy of the crown was, however, partly defeated by the resistance of the Hungarians, who demanded and finally obtained the recognition of the historical rights of the Hungarian monarchy. In this article we shall treat only of the Austro-Hungarian monarchy as a whole, and of the Cisleithan half of the empire. For the rest, see **HUNGARY**.—The total area of the empire is 240,381 sq. m., extending from lat. 42° 10' to 61° 4' N., and from lon. 9° 35' to 26° 35' E. Its population, according to the census of 1869, amounted to 35,904,435. The empire is a continuous territory, only two districts (Cattaro and Ragusa) being separated from the main body by small strips of Turkish territory. Of the 21 states or provinces (*Kronländer* or crown lands) which, according to the reorganizing statutes of 1849 and 1851, were to constitute the united Austrian monarchy (*Oestreichische Gesamtmonarchie*), the following 14, according to the new arrangement made in 1867, belong to the "countries represented in the Reichsrath," or to the Cisleithan provinces: 1, the archduchy of Lower Austria (*Oestreich unter der Enns*), 7,655 sq. m., pop. 1,990,708; 2, the archduchy of Upper Austria (*Oestreich ob der Enns*), 4,633 sq. m., pop. 736,557; 3, the duchy of Salzburg, 2,767 sq. m., pop. 153,159; 4, the duchy of Styria (*Steiermark*), 8,671 sq. m., pop. 1,187,990; 5, the duchy of Carinthia (*Kärnthen*), 4,006 sq. m., pop. 337,694; 6, the duchy of Carniola (*Krain*), 3,857 sq. m., pop. 466,334; 7, the Coastland or Littoral, embracing the counties of Görz and Gradisca, the margraviate of Istria, and the district of Trieste, 3,085 sq. m., pop. 600,525 (the three last-named provinces form the kingdom of Illyria); 8, the county of Tyrol with Vorarlberg, 11,325 sq. m., pop. 885,789; 9, the kingdom of Bohemia (*Böhmen*), 20,064 sq. m., pop. 5,140,544; 10, the margraviate of Moravia (*Mähren*), 8,585 sq. m., pop. 2,017,274; 11, the duchy of Silesia (*Schlesien*), 1,988 sq. m., pop. 513,352 (these 11 states were until 1866 members of the German confederation); 12, the kingdom of Galicia, including the former republic of Cracow (annexed by Austria in 1846), and the duchies of Auschwitz and Zator, both of

which belonged until 1866 to the German confederation, 30,313 sq. m., pop. 5,444,689; 13, the duchy of Bukowina, 4,086 sq. m., pop. 513,404; 14, the kingdom of Dalmatia, 4,940 sq. m., pop. 456,961. Total area of the 14 provinces represented in the Reichsrath, 115,925 sq. m.; total population, 20,394,980. This includes 177,449 soldiers, deducting whom the civil population amounts to 20,217,531. The aggregate population of these 14 provinces in 1830 was 15,588,142; in 1850, 17,534,950; in 1857, 18,224,500. At the close of the year 1871 the civil population was officially calculated at 20,555,370. Of the remaining seven provinces, Lombardy and Venetia have been ceded to Italy in consequence of the wars of 1859 and 1866; and the kingdom of Hungary, the kingdom of Croatia and Slavonia, the waywodeship of Servia, the grand duchy of Transylvania, and the Military Frontier now belong to the lands of the Hungarian crown (the waywodeship of Servia having however ceased to be a separate crown land and been incorporated with Hungary proper).—About five sevenths of the Austrian territory are mountainous. There are three principal chains of mountains, each of them sending off many branches, viz.: 1. The Alps (Rhetian, Noric, Carnic, Julian, and Dinario), covering almost the entire southern belt of the German provinces, as well as Illyria and Dalmatia (see ALPS); their highest peaks are the Ortler (12,852 ft.) and the Gross-Glockner (12,776 ft.). 2. The Carpathians, about 800 m. long, beginning at the confluence of the Danube and the March, near Presburg, sweeping in an arc to the confluence of the Danube and Cserna, on the confines of Wallachia and Servia. (See CARPATHIAN MOUNTAINS, and HUNGARY.) The bold and rugged granite cliffs of the Carpathians, in N. Hungary and E. Transylvania, rise to a height of more than 8,000 ft. above the level of the sea. 3. The Sudetic mountains, with the Bohemian forest and the Ore mountains (Erzgebirge, between Bohemia and Saxony), forming together an almost uninterrupted chain of granite and gneiss formation. The highest section of this chain, the Giant mountains or Riesengebirge, between Bohemia and Prussian Silesia, rises in the Schneekoppe, or Snow peak, to an elevation of upward of 5,000 ft. above the level of the sea. Besides these three great chains there are several parallel ranges of considerable height. Thus on both sides of the Alps there extend limestone ranges, the northern ones towering up to the height of 9,840 ft. (the Dachstein, or Roof peak, on the boundary line of Salzburg and Styria), while the southern ones, reaching to the height of 10,903 ft., cover nearly the whole territory of Illyria and Dalmatia. Again, the Carpathians are surrounded by sandstone mountains, which almost fill up the territory of Transylvania. Of large plains there are only two: the great Hungarian basin, covering about 40,000 sq. m., and the Galician basin, which is interrupted by several ranges of hills and

covers about 20,000 sq. m.—The seacoast of Austria extends from the head of the gulf of Venice to the S. point of Dalmatia, on the E. side of the Adriatic, 1,086 m. Austria belongs to four of the great river systems of Europe, those of the Black sea, the Baltic, the German ocean, and the Mediterranean. Among the numerous streams the Danube is by far the most important; it is, in fact, the main artery of the Austrian empire, and may at no very distant period become for a large portion of southern Europe what the Mississippi is for the United States. The Danube, being the largest European river after the Volga, enters Austria from Bavaria as a stream navigable at all seasons, but its channel formerly offered serious impediments to navigation, all of which have been removed or are in process of removal. (See DANUBE.) Steamboats were first introduced on the Danube in 1830. Since 1835 the Austrian steam navigation company has increased their number from year to year, until in 1869 it maintained 146 steamboats and propellers, besides 550 barges, scows, &c. The entire length of the Danube in Austria is nearly 900 m., and its average width 600 ft. Most of its tributaries are navigable for small craft, and steam has been introduced on several. The river Theiss, in Hungary, the most considerable of them all, said also to have a greater abundance of fish than any other European river, is navigated by steamboats from Tokay down to the Danube; it has a length of upward of 600 m. The Save, which enters the Danube near Belgrade, is navigable for a large part of its course. Steamboats also ply on the Inn, on the Bavarian frontier, and since 1857 even on the Salzach, a smaller stream, emptying into the Inn. The other important tributaries of the Danube, in their geographical order, are the Traun, the Enns, the March or Morava, the Raab, the Waag, the Neutra, the Gran, the Eypel, and the Drave or Drau, all of which are navigable. The Moldau, tributary to the Elbe, in Bohemia, is also navigated by steamboats. The Vistula, Dniester, and Pruth rise within the Austrian empire in Galicia, the Elbe in Bohemia, and the Adige in Tyrol.—The lakes of Austria are numerous, though not very large. The Platten or Balaton lake in S. W. Hungary has a surface of about 400 sq. m. The only salt lake in Austria is the Neusiedler lake in W. Hungary, nearly 20 m. long, and from 5 to 7 m. wide. The Czirknitzer lake, in Carniola, is remarkable as containing a number of subterranean cavities, through which its waters from time to time disappear and again flow in.—The climate of Austria is temperate and very wholesome. From the southern boundary up to lat. 46°, the average temperature is 54.4° F.; from lat. 46° to lat. 49°, it is 50° to 52°; beyond lat. 49° it is 48°. The winter is very severe in the mountainous districts, but sudden changes of temperature are not frequent.—Nature has endowed Austria with a greater variety of productions

than any other European state. Platina excepted, all metals abound. Gold is produced in Hungary and Transylvania; silver and the best quality of European copper in Hungary; quicksilver in Carniola (the mine at Idria used to yield 12,000 cwt. per annum); tin in Bohemia; lead in Carinthia; iron almost everywhere (a single mine in Styria yields over 15,000 tons annually). The following are produced in smaller quantities: zinc (about 44,000 cwt. in 1869), arsenic (1,376 cwt.), antimony (11,786 cwt.), chrome, bismuth, and manganese. Black tourmaline, alabaster, serpentine, gypsum, black lead, slates, flint, and marble abound in many portions of the empire. The precious stones found in Austria are: the Bohemian carbuncle, the Hungarian opal, chalcedony, ruby, emerald, jasper, amethyst, topaz, carnelian, chrysolite, beryl. The coal beds of Austria are considered almost inexhaustible. Of rock salt there is a bed several hundred miles in length in Galicia, of which only a small portion is worked at the gigantic mine of Wieliczka, near Cracow, a perfect subterranean city, or rather four cities, one below the other, extending in a labyrinth of galleries, and hewn into the salt rock 9,500 ft. from N. to S., and 3,600 ft. from E. to W. Of mineral springs Austria contains upward of 1,600, of which the most celebrated are at Carlsbad, Marienbad, Teplitz, and Franzensbad, in Bohemia; Ischl, in Upper Austria; Baden, in Lower Austria; Gastein, in Salzburg; Gleichenberg, in Styria; Bartfeld, Treuttschin, and Parád, in Hungary; Mehadia, in the Military Frontier district.—The vegetable kingdom of Austria shows the same variety as the mineral. Wheat is the staple produce of the German provinces and of Hungary; buckwheat is raised in the sandy regions; Indian corn, rice, and kidney beans are raised in Hungary; the finest varieties of apples and pears in Bohemia, Austria proper, and Tyrol; of plums, in Hungary. Hungary produces immense quantities of cucumbers, melons, watermelons, pepper, anise, licorice, poppies, chicory, sweet-flag, ginger, flax, hemp, and tobacco.

Cotton is raised in Dalmatia, hops in Bohemia, saffron and woad in Lower Austria. The Hungarian wine (more than one half of the entire wine product of Austria) is an excellent article, some brands being justly counted among the very best wines of the world (Tokay, Ménes, &c.). About 68,000 sq. m. of the Austrian territory are covered with forests, mostly oak, pine, and hemlock, in the northern, and maple, stone pine, olive, laurel, myrtle, and chestnut trees, in the southern provinces. Horses are raised everywhere, but only those of the Bukowina are of a superior stock; sheep and horned cattle in Hungary and Galicia (buffaloes in Croatia and Transylvania); goats and hogs in Hungary. The silkworm has been introduced in Tyrol, Croatia, Slavonia, Illyria, and Dalmatia. Game is plentiful, deer, wild boars, and hares being found almost everywhere; black bears, chamois, lynxes, wolves, and beavers, only in some districts. Pearl mussels are frequently found in several rivers and creeks of Hungary.—The increase of the population of the Austro-Hungarian monarchy from 1850 to 1869 has been on an average 0.84 per cent. According to the general census of 1857, the monarchy had 37,754,856 inhabitants. Since then it has lost two provinces, Lombardy and Venetia, with a population of about 5,000,000; but the natural increase from 1857 to 1869 has nearly made up this loss. The inhabitants of the empire live in 927 cities, 2,039 boroughs, and 73,252 villages. Of the cities, one (Vienna) has upward of 600,000 inhabitants; two, Pesth and Prague, have more than 150,000; 12 above 40,000; 6 above 30,000; 35 above 20,000; and 97 above 10,000. In no country in the world has the nationality question at present so great a political importance as in Austria. No official census of the nationalities has been taken since 1850. The following estimates of the strength of all the important nationalities of the empire in 1869 is taken from Schmitt's *Statistik des österreichisch-ungarischen Kaiserstaates* (4th ed., 1872):

NATIONALITIES.	Total number in Cisleithania.	Per cent. in Cisleithania.	Total number in Transleithania.	Per cent. in Transleithania.	Total number in Monarchy.	Per cent. in Monarchy.
Germans	7,103,900	25.16	1,894,900	12.90	9,008,700	25.27
Czechs and Slovaks	4,718,900	28.84	1,841,100	11.95	6,559,900	18.41
Poles	2,443,500	12.08	2,443,500	6.86
Ruthenians	2,584,000	12.50	48,000	3.21	3,032,000	8.51
Slovens (or Winds)	1,193,200	5.92	0.87	1,254,200	3.53
Croats and Serbs	522,400	2.55	2,405,700	15.60	2,928,100	8.22
Magyars	11,700	0.09	5,688,100	36.59	5,705,500	16.01
Italians	581,500	2.91	600	582,100	1.66
Roumans	207,900	1.02	2,477,700	16.08	2,685,600	7.54
Jews	820,900	4.05	532,100	3.58	1,372,900	3.86

Of the Cisleithan provinces only Upper Austria and Salzburg are wholly German; in the other provinces the numerical relation of the principal nationalities, according to the same authority, was in 1869 as follows: Lower Austria—Germans 90 per cent., Czechs 6; Styria—Germans 63, Slovans 36; Carinthia—Germans 69,

Slovans 31; Carniola—Germans 6, Slovans 93; Littoral—Germans 4, Slovans 42, Croats 21, Italians 31; Tyrol—Germans 60, Italians 39; Bohemia—Germans 38, Czechs 60; Moravia—Germans 26, Czechs 71; Silesia—Germans 51, Czechs 19, Poles 29; Galicia—Germans 3, Poles 42, Ruthenians 44, Jews

11; Bukowina—Germans 7, Ruthenians 40, Roumans 39, Jews 9; Dalmatia—Croats and Serbs 87, Italians 13. Thus the Germans may always be expected to control, when the nationality question is at stake, the provincial diets of Upper and Lower Austria, Styria, Salzburg, Carinthia, and Silesia. The Czechs prevail in Bohemia and Moravia, the Slovaks (or Winds) in Carniola, the Croats and Serbs in Dalmatia. In Galicia, according to the above table, the Ruthenians exceed the Poles in number; but the Poles, to whom the higher classes of society belong, have an undisputed control of the diet, and in general of the province as a whole. The Germans, though only 35 per cent. of the population of the Cisleithan provinces, are the ruling race in this part of the monarchy, while the Magyars dominate in the lands of the Hungarian crown, although they likewise embrace no more than about 37 per cent. of the entire population. The number of languages or dialects spoken in Austria exceeds 20, but German is the highest official language in the Cisleithan, and Magyar in the Transleithan provinces. It is a significant fact that at a Pan-Slavic congress held at Prague in 1848, the delegates of the different Slavic nationalities found themselves under the necessity of using the German language, being unable to understand the different dialects of their own tongue. The density of population is very unequal, but is generally greater in the eastern than in the western portions of the empire. The extremes are Lower Austria, which contains Vienna (259 to the sq. m.), and Salzburg (55 to the sq. m.).—More than three fourths of the entire population of Austria acknowledge the religious supremacy of Rome; of these, in 1869, 23,954,238 were Roman Catholics proper, 3,941,796 United Greeks, and 8,279 Armeno-Catholics. The population connected with the Greek Oriental church amounts to 3,050,830; and that belonging to the Armenian proper (Gregorian) to 1,854. The Reformed church has 2,143,178 professors; the Lutheran, 1,365,835; the Unitarians, 55,070. The Jews number 1,372,800. The remainder belong to minor sects. The Roman Catholic church in Austria has 11 archbishoprics and 42 bishoprics; 2 archbishoprics and 7 bishoprics belong to the United Greek, and 1 archbishopric to the Armeno-Catholic. The Greek Oriental church has 3 archbishoprics and 10 bishoprics. In 1869 the number of Roman Catholic convents in Austria was 965, containing 8,743 monks and 5,671 nuns. By the concordat with the pope, concluded in September, 1855, the Roman Catholic church in Austria received great prerogatives; but these were rescinded by the reform laws of 1868, and in consequence of the promulgation of papal infallibility as a doctrine of the church, the Austrian government in 1870 declared the concordat abrogated. The affairs of the Lutheran and Reformed churches are administered in the Cisleithan provinces by the evangelical supreme church council at Vienna

and two general synods, one Lutheran and one Reformed. The Lutheran church is divided into 4 superintendencies and subdivided into 15 seniorates; the Reformed church consists of 4 superintendencies, which are divided into 6 seniorates. The Jews have about 500 rabbis in the entire monarchy.—Public education has been in the course of thorough reorganization since 1848. In the Cisleithan provinces, it is chiefly regulated on the basis of the law of May 14, 1869. The number of common or primary schools has been steadily increased, until in 1869 it was 31,218, or one for every 1,159 inhabitants. The common schools are of two grades. In those of the lower grade reading, writing, ciphering, religion, the elements of history and natural history, singing, and gymnastic exercises are taught; in those of the higher grade (*Bürgerschulen*), composition, arithmetic, geometry, bookkeeping, and drawing are added. In 1869, 2,852,843 children out of 3,624,295 went to the common schools. Education is compulsory, and in the Cisleithan provinces children are bound to attend school from their 6th to their 14th year. Nearly all the children of this age attended school in 1869 in Upper and Lower Austria, in Salzburg, Styria, Tyrol, Bohemia, Moravia, and Silesia; but in Galicia, Bukowina, and Dalmatia, only one out of three children received an education. The number of normal schools for the education of teachers was for the whole empire about 100. The middle schools (*Mittelschulen*) are divided into *Gymnasien* (colleges), which prepare their pupils for the universities; *Realschulen*, which prepare them for the technical high schools; and *Realgymnasien*, recently instituted, which combine both courses. The monarchy in 1870 had 241 gymnasien, 20 realgymnasien, and 74 realschulen; the Cisleithan provinces 99 gymnasien, 19 realgymnasien, and 49 realschulen. In 1871 Austria had 7 universities (Vienna, Prague, Pesth, Lemberg, Innsbruck, Gratz, and Cracow), to which in 1872 a new one was added at Klausenburg in Transylvania, and 8 technical high schools (*Technische Hochschulen*), most of which have been recently reorganized so as to comprise a number of special schools. The universities in 1870 had 707 professors and 10,877 students; the technical high schools, 265 professors and 3,010 students. To the last-mentioned class of institutions may be added 2 mining academies, 1 agricultural academy, 4 commercial academies, and the academy for commerce and navigation at Trieste. Not included in the above statement are a number of special schools for theology, for law and political economy, for surgery, midwifery, and veterinary surgery, for commerce, trade, and navigation, for agriculture, for mining, the art schools, the schools for the education of military officers, and a large number of private schools. The largest of the public libraries are the imperial library at Vienna, numbering 410,000 volumes; the university library at Vienna, containing up-

ward of 200,000 vols.; the university libraries of Pesth, Cracow, and Prague; and that of the national museum of Pesth. There are many museums, cabinets of science and art, galleries of paintings, &c., in the principal cities of the empire. Several splendid collections belonging to private individuals are always open to the public.—Before 1848 the most rigorous censorship rendered a well regulated public press an impossibility. During the revolution in 1848 these restraints were removed, but in 1852 a law for the regulation of the press gave the police absolute control over the political press, and restored the censorship in all but the name. In 1862 the government again found it necessary to grant freedom of the press; and after the reorganization of the empire in 1867, it was again confirmed by a law of Oct. 15, 1868. In 1870 there were published in Austria 185 political newspapers and 578 non-political. Of the former, 100 are in German, 17 in Bohemian, 11 in Polish, 5 in other Slavic languages, 11 in Italian, 32 in Hungarian, 4 in Roumanian, 2 in Greek, 2 in Hebrew, and 1 in French; of the latter, 336 in German, 121 in the Slavic languages, 20 in Italian, 91 in Hungarian, 5 in Roumanian, 3 in Hebrew, 1 in Latin, and 1 in French. Some of the large daily papers published in Vienna and Trieste are among the best and most influential of the continental journals.—In 1869 the number of public hospitals in Cisleithan Austria was 408; of lunatic asylums there were 15; lying-in establishments, 19; foundling hospitals, 15; institutions for the sustenance of old and indigent persons, 979; poorhouses, 6,648. The number of foundlings provided for by the government exceeds 65,000. The immense hospitals of Vienna, established by Joseph II., are perhaps the best regulated in the world. There are besides a number of hospitals connected with the convents, where over 20,000 persons are relieved annually, without distinction of creed or nationality. In the military hospitals 181,976 persons were received in 1869. Every provincial capital has an imperial loan office for the poor, the profits of which are made over to the treasury of the almshouse department.—The total value of the mineral produce of Austria in 1869 was set down at 89,415,465 florins (the florin is equal to 47 cents). Of this sum, more than one third (32,446,603) was the value of the salt produced. The yield of the gold mines in 1869 was 56,752 oz., that of the silver mines 1,339,712 oz., that of copper 53,957 cwt., of lead 102,000 cwt. The total quantity of salt produced in 1869 was as follows: rock salt, 3,872,424 cwt.; spring salt, 2,804,823; sea salt, 77,571; industrial salt, 861,988. The most remarkable increase has taken place in the production of iron and coal. The latest statistics, published in 1869, showed the production of raw or pig iron to be 6,087,830 cwt., and that of cast iron 753,563. The coal produced in Austria, which in 1838 netted only

some 4,000,000 cwt., and in 1854 and 1855 full 30,000,000, in 1869 reached 146,000,000 cwt.—The Austrian empire may, as regards its agriculture, be divided into four sections: 1, the Alpine countries—Austria proper, Salzburg, Tyrol, Carniola, Carinthia, Styria, and the Littoral; 2, the eastern provinces—Hungary, Croatia, Slavonia, the Military Frontier, and Transylvania; 3, the northern provinces—Moravia, Bohemia, Silesia, Galicia, and Bukowina; 4, the southern province of Dalmatia. In the Alpine countries the density of the population compels the farmer to till even the steepest hillsides. The narrow plains yield potatoes, barley for brewing, and fodder; on the sunny sides of the mountains the grape is cultivated extensively. The production of breadstuffs in these countries is not equal to the consumption. The agricultural condition of those portions of the eastern provinces covered by the Carpathian mountains is similar to that of the Alpine countries; but the scanty products of these territories are largely made up by the surplus of the level country, which, with very few exceptions, is of extraordinary fertility, especially in the river bottoms. A large portion of the pasture land is entirely capable of cultivation, and would be put under plough but for want of labor. The most fertile regions, although thinly populated, produce a large surplus for exportation to the Alpine countries. The extensive pastures are used for cattle-raising. Draught cattle are exported to nearly all adjoining regions; beef cattle mostly to the Alpine provinces. Hog fattening is carried on upon a very large scale. The Hungarian wine and tobacco are noted for their excellent quality. In the northern provinces but few places are adapted to the culture of the grape. Moravia, belonging to the basin of the Danube, has some large and fertile plains, but Bohemia is hilly to a great extent, Silesia entirely so, while Galicia, descending as it does from the Carpathians to the courses of the large streams, shows every variety of formation. Grain and potatoes are the staple produce of these countries, supplying the domestic demand. Breweries, distilleries, and beet sugar factories are numerous in these provinces. The following table shows the area in square miles of the productive soil, and of the arable, wine, meadow, pasture, and wood land, both of the Cisleithan provinces and of the entire monarchy, in 1869:

	Cisleithania.	Entire Monarchy.
Arable land.....	87,786	75,798
Wine land.....	792	2,259
Meadows and gardens.....	15,020	30,973
Pastures.....	18,063	84,456
Woodland.....	83,323	64,416
Productive soil.....	106,863	211,931
Unproductive soil.....	9,062	28,450
Total.....	115,924	240,381

The aggregate value of the agricultural produce of Austria was estimated in 1857 by Herr von Kleyle, assistant secretary of state, at 2,500,000,000 fl., and in 1871 by Prof. Brachelli at 2,400,000,000 fl. The government of Francis Joseph has endeavored to promote agriculture and cattle-breeding by agricultural fairs, exhibitions of implements, premiums for improved stock, the introduction of new branches of agriculture, and other measures; and particular attention has been paid to the American improvements of agricultural implements and machinery. The culture of some American plants has also been introduced, broom corn among others. The number of horses in Austria in 1869 was 3,578,518; of horned cattle, 12,515,212; of sheep, 19,905,898; of goats, 1,569,104; of swine, 7,051,478.—Austrian manufactures, whose existence may be said to date only from the reign of Joseph II., are now striving to rival those of every other European nation, England excepted. The number of hands employed in the manufacturing establishments in 1869 was 2,273,816; the value of their annual produce, 1,500,000,000 fl. Of this sum, 80,000,000 fl. is the estimated value of the iron ware, 50,000,000 that of chemical preparations, and 20,000,000 that of glassware and looking glasses (equal in quality to the French). Hemp and flax are manufactured into goods worth 150,000,000 fl. The value of the woollen fabrics is upward of 140,000,000 fl. The number of cotton spindles in Austria in 1870 was 1,581,000; the total value of cotton goods produced, 120,000,000 fl. The quantity of cotton manufactured in Austria in 1850 was five times as large as in 1831. Since then the progress of this branch of industry has been comparatively slow. The manufacture of tobacco is monopolized by the government (the monopoly having been extended over Hungary, which formerly was excepted from it, in 1850). The most numerous and extensive industrial establishments are in Austria proper (chiefly in Vienna) and Bohemia, the fewest and smallest in Dalmatia and the Military Frontier. There are three principal centres of industry: Vienna, for the manufacture of all objects of luxury and musical instruments; Moravia, Silesia, and Bohemia, for linen and woollen fabrics and glassware; Styria and Carinthia, for iron goods and hardware. The government endeavors to promote the growth of Austrian industry by establishing schools of mechanical arts, trade unions, industrial exhibitions, &c. In order to encourage inventors, the patent laws were entirely remodelled in 1852.—The commerce of Austria has since 1816 gradually grown into importance, although crippled until 1850 by a prohibitory tariff, and by the political organization of the empire, being at that time merely a dynastic union of different states, rendering the provincial boundary lines so many barriers against internal intercourse. At an early period the Austrian government took care to spread a perfect network of excellent commer-

cial roads over the whole empire. The roads over the Alps, the Stiffler Joch, the Splügen, the Semmering, and others, are justly counted among the most remarkable works of modern times. The first railway in Germany was built on Austrian territory, connecting Budweis and Linz (1832). The aggregate length of railroads (inclusive of horse railroads), on Jan. 1, 1871, was 6,324 m. Telegraph lines have been constructed in all directions. In 1870 there were in Austria 16,564 m. of electro-magnetic telegraph, with an aggregate length of wires of 50,876 m. The number of post offices in all Austria was 4,767. The most important canal for commerce is the emperor Francis's canal, connecting the Danube and Theiss, and saving a circuit of 220 m. On July 1, 1851, the customs line between Austria proper and Hungary was abolished; on Feb. 1, 1852, a new tariff was published, by which the protective system was introduced in lieu of the previous prohibition, which was now limited to three articles of government monopoly, viz., salt, gunpowder, and tobacco. In 1852 the river duties on the Elbe, Po, and Danube were abolished. A postal union was concluded with most of the German states in 1850, and was followed in 1853 by a commercial treaty between Austria and the German Zollverein. On April 11, 1865, a new customs and commercial treaty was concluded with the German Zollverein, which, by considerable reduction of duties and the establishment of uniformity of regulations, greatly increased the commerce of Austria with the states of the Zollverein. Other important commercial treaties were concluded with the United States, Mexico, Persia (1857), Turkey (1862), Great Britain (1865 and 1869), France (1866), Belgium (1867), the Netherlands (1867), Italy (1867), the states represented in the German Zoll parliament (1868), and Switzerland (1868). Chambers of commerce and industry were introduced in Austria in 1850. Their rights and functions in the Cisleithan provinces were regulated by the law of June 29, 1868. In 1871 there were in Cisleithan Austria 43 chambers. According to a treaty concluded in 1867 between the governments of Cisleithania and Hungary, both these divisions of the empire constitute with regard to customs and commercial intercourse one territory, encircled by one customs boundary line, from which are only excluded Dalmatia, which constitutes a customs territory by itself, Istria and the Quarnero islands, the free ports of Trieste, Buccari, Zengg, Portoré, Carlopago, the town of Brody in Galicia, and the commune of Jungholz in Tyrol. The commercial intercourse between the two divisions according to this treaty is entirely free, and the goods carried from the one into the other can be subjected to only those burdens which may be imposed upon the products of the producing division itself. All treaties with foreign powers regulating commercial relations are concluded by the imperial government for both divisions of the empire.

Among the large moneyed institutions the Austrian national bank of Vienna (established in 1816) maintains the highest rank, although its importance is much more due to its intimate connection with the financial administration of the empire than to its commercial transactions. In 1869 it had 28 branches, nine of which were in the lands of the Hungarian crown. A most powerful institution is the Austrian Lloyd, at Trieste, a joint-stock company established by Von Bruck in 1838, and unrivalled in the variety of its enterprises. It is divided into three sections: one devoted to the insurance business and the collection of statistics for the maritime trade, the second (established in 1857) to ocean-steamship navigation, the third (established in 1849) to the promotion of literature and art. This company has gradually been developed into gigantic proportions, almost monopolizing the Levant trade on the eastern portion of the Mediterranean. It has established regular steamship lines between Trieste and almost every port on the Adriatic, *Ægean*, and Black seas. The number of its steamships in 1858 was 56; in 1870, 70. Another great institution is the Danube steam navigation company. The first river steamboat in Europe built on the American pattern was built for this company in 1854. Early in 1856 the *Credit-Anstalt* at Vienna, an imitation of the *Paris société de crédit mobilier*, went into operation, the subscription to its stock having reached the enormous amount of 640,000,000 florins, or upward of \$300,000,000; but the strong impulse given by this institution to speculation and stock-jobbing led at the beginning of the year 1857 to a violent financial revulsion. An extraordinary impulse was given to the development of large moneyed institutions in 1862 and the following years. The *Statistisches Jahrbuch für das Jahr 1870* (Vienna, 1872) enumerates 44 institutions of this kind in the Cisleithan provinces, all of which, with the exception of five, were established after 1862, and no fewer than 21 in 1869. The aggregate paid-up capital of these institutions amounted in 1870 to 281,800,000 florins. The following institutions had the largest capital: Austrian National bank, 90,000,000 fl.; Austrian Credit Institution, 40,000,000; Austrian Land Credit Institution (established in 1864), 9,000,000; Anglo-Austrian bank (1863), 14,000,000; Franco-Austrian bank (1869), 8,000,000; Austro-Egyptian bank (1869), 4,000,000; Union bank (1870), 12,000,000. The number of savings banks in the Cisleithan provinces at the close of 1870 was 184, with deposits amounting to 285,300,000 fl. The total value of the commercial movement of Austria (exclusive of precious metals) in 1870 is shown as follows:

	Imports.	Exports.
Austro-Hungarian Customs Territory.....	Florins. 416,100,000	Florins. 389,200,000
Customs Territory of Dalmatia.....	8,600,000	6,700,000
Total.....	424,700,000	395,900,000

In 1869 the imports into Austria from the German states represented a value of 301,900,000 fl.; the exports from Austria into the German states, 241,000,000 fl.—The development of the shipping of Austria since 1841 is shown by the following table:

YEARS.	Vessels.	Tons.	Men.
1841.....	5,574	215,598	27,896
1849.....	6,038	229,538
1856.....	10,006	830,469	86,502
1871.....	7,348	875,822	28,344

Of these 5,767, carrying 267,134 tons, were ocean vessels; 91, carrying 49,977 tons, and 17,749 horse power, steamships. The apparent decrease during the period from 1856 to 1871 is due to the loss of the Italian provinces. In 1870 the maritime commerce of Trieste amounted to 226,290,000 fl., viz.: imports, 125,870,000; exports, 100,420,000. Trieste is by far the most important seaport of Austria, and, besides Marseilles, perhaps the only one on the European continent which has advanced at a very remarkable rate. The following table shows the most important among the other ports of the empire:

PORTS.	Entries in 1869.	Tons.

—The fundamental law which divides the monarchy into two states or divisions bears the date of Dec. 21, 1867. According to this law, each of the two divisions (the "countries represented in the Reichsrath" and the "countries of the Hungarian crown") has its own constitution, but they are united under the same monarchy and have in common an imperial ministry (*Reichsministerium*) for the administration of those affairs which have been constitutionally defined as common to both parts of the empire. Such are the foreign affairs, nearly the whole department of war, inclusive of the navy, and the finances of the joint monarchy. Several other subjects, though not defined as common affairs, are to be equally treated according to principles from time to time agreed upon by the two legislatures. In this class belongs legislation on duties, on certain indirect taxes, and on railways in which both divisions are interested. For the countries represented in the Reichsrath the following fundamental laws are specially recognized as valid: 1, the "Pragmatic Sanction" of the emperor Charles VI. of Dec. 6, 1724, which regulates the order of succession and declares the indivisibility of the empire; 2, the diploma of Francis Joseph I. of Oct. 20, 1860, which introduces the constitutional form of government; 3, the six fundamental laws of

Dec. 21, 1867, regulating the representation of the people, defining the general rights of citizens, the judicial, administrative, and executive power, and appointing an imperial court (*Reichsgericht*). The Austro-Hungarian monarchy is an empire hereditary in the Hapsburg-Lorraine dynasty. After the entire extinction of the male line, the crown may be inherited by female descendants. The emperor attains his majority when 18 years old, and must belong to the Roman Catholic church. On entering upon the government, he must take an oath to support the constitution. He is addressed as imperial and royal apostolical majesty, and has three different titles, the shortest of which is emperor of Austria, king of Bohemia, &c., and apostolical king of Hungary. The emperor shares the legislative power with the representative assemblies of Cisleithania and of Hungary, and with the provincial diets. Without the consent of these bodies no law can be made, altered, or abolished. With regard to the affairs common to the whole empire, the Austrian Reichsrath and the Hungarian diet exercise their legislative rights through two delegations, consisting each of 60 members, one third chosen from the upper and two thirds from the lower house. The delegations serve only one year, and meet alternately at Vienna and at Pesth. The members of the imperial ministry for the common affairs of the empire, namely, the ministers of foreign affairs, of war, and of the imperial finances, are responsible to the delegations. The Reichsrath of the Cisleithan provinces consists of a house of lords (*Herrenhaus*) and a house of deputies (*Abgeordneten-Haus*). The upper house embraces all imperial princes who are of age, the chiefs of a number of noble families who have been declared hereditary members of the house, all the archbishops and prince-bishops, and an unlimited number of distinguished men whom the emperor may appoint as life members. The house of deputies in 1872 consisted of 203 members, chosen by the provincial diets from their own members for a term of six years. Their term ceases sooner, however, if they cease to be members of the provincial diet. If a provincial diet does not send delegates to the Reichsrath, the emperor has the right to order direct elections. The provincial diets exercise a legislative right with regard to subjects which have not expressly been reserved for the Reichsrath. These diets consist of the archbishops and bishops of the province, of the rector of the university, and of delegates chosen by the holders of large estates, by towns and other places, by the chambers of commerce and industry, and by the rural communities. Both the Reichsrath and the provincial diets are convoked annually. The ministers of Cisleithania are responsible to the Reichsrath, which may impeach them. The decision in such a case is given by a special state court organized by the Reichsrath. Every citizen 30 years of age is

eligible to the provincial diet, but the right of voting is made contingent on the payment of a tax, the amount of which is fixed by law. The particular ministry of Cisleithania consists of seven sections, namely: interior, worship and education, commerce, agriculture, the defence of the country, justice, and finances. The provinces or crown lands are governed by governors (*Statthalter*), or provincial presidents (*Landespräsidenten*). Municipal officers are elected in accordance with the imperial law of March 5, 1862, by citizens possessing a certain amount of property and paying a certain amount of taxes. The administration of justice was reorganized in 1851, and again by the fundamental laws of 1867. All privileged jurisdiction has been entirely abolished. There are three degrees of jurisdiction. The district courts and district collegiate courts (894 in 1869) have original jurisdiction in civil suits up to a certain value, and in petty criminal cases, and the county courts (*Landesgerichte*), of which there were 62 in 1869, have original jurisdiction in all other civil cases and in all criminal cases; they have also appellate jurisdiction in cases tried by the district courts. Offences of the press are, according to the law of March 9, 1869, tried by juries. The provincial courts (*Oberlandesgerichte*), of which there are 9 in Cisleithania, are the courts of last resort for cases tried by the district courts, and of second resort for civil cases tried by the county courts. The highest tribunal of the monarchy is the court of appeals (*Oberster Gerichts- und Cassationshof*), at Vienna. The civil law is administered according to the code of 1811. The criminal code of 1804 was amended in 1852. The number of persons sentenced for crime in Cisleithan Austria in 1869 was 25,665, or 1 for every 787 of the population.—The finances have at all times been the sore point of the Austrian administration. Having been utterly prostrated by the Napoleonic wars, their condition was slowly improving when the revolutions of 1848, and the consequent wars in Italy and Hungary, again brought Austria near the verge of bankruptcy. The government paper currency fell some 20 per cent. below par. The prospect had begun to brighten when the eastern war and the position of armed neutrality maintained by Austria once more destroyed every hope of bringing the income and the expenditure to balance each other. The income has been steadily increasing, but so has the expenditure. By keeping a separate account

YEARS.	Income.	Expenditure.	Deficiency.
	Florins.	Florins.	Florins.
1848....	121,819,615	186,679,486	64,867,871
1849....	144,018,769	289,468,048	145,454,390
1850....	191,296,467	268,458,080	77,161,608
1851....	233,226,088	278,420,470	55,194,382
1852....	237,186,998	298,960,628	66,823,635
1853....	245,838,724	294,529,681	49,195,957
1854....	268,508,796	321,377,664	52,868,868
1855....	393,637,965	510,359,562	111,701,597

of the "extraordinary expenditure," the Austrian government organs showed an apparent improvement of the financial condition, but this was an illusion. The foregoing table shows the excess of expenditures over receipts in some of the years following the revolutionary movements of 1848. Since the reorganization of the empire in 1867, there are separate budgets for the common affairs of the whole empire and for each of the two large divisions. In the budget for 1872 the amount needed for the common affairs of the empire is estimated at 110,647,498 florins, of which 95,165,007 were to be devoted to the army and 11,254,690 to the navy. From the receipts of the ministry of war, the excess of duties, and the incomes of the consulates, 17,208,883 were to be obtained; of the balance, 93,438,615, the Cisleithan provinces were to furnish 65,145,402, and the Transleithan provinces 28,293,213. The budget of the countries represented in the Reichsrath for 1871 fixes the revenue at 338,084,609, the largest items being 80,200,000 from direct taxes, 187,073,546 from indirect taxes, 33,461,058 from the state domain and from state institutions. The expenses were to amount to 349,811,642 fl. (99,984,711 fl. interest on the public debt). Thus there would again be a deficit of 11,727,033. The consolidated debt of Austria on Dec. 31, 1870, amounted to 2,572,733,402 fl.; the entire debt to 2,593,269,591, being an increase over 1869 of 3,000,000 fl. The aggregate debt of the provinces amounted in June, 1870, to 249,979,690 fl.—The army of the entire monarchy was reorganized in 1868. According to the new regulations the liability to military service is universal, begins with the completion of the 20th year, and must be rendered personally. The army is divided into the standing army, the navy, the landwehr, the reserve, and the landsturm. In the Cisleithan provinces military duty lasts 10 years (3 years in the line, 7 in the reserve). In the landwehr those who have been in the line and in the reserve have to remain 2, all others 12 years. The standing army and the navy are placed under the imperial minister of war for the common affairs of the empire; the landwehr and the landsturm (which is to comprise all men capable of doing military duty until the 50th year of age, but was not yet generally organized in 1871) are in each division of the empire placed under the minister for the defence of the country. The standing army numbered in August, 1871, 254,041 men on the peace footing; in time of war the army, including the reserve, would number 820,811 men; while the landwehr numbered in addition 219,471 men. The subdivisions are: 1. Infantry: 80 regiments of the line, 14 regiments of frontier men, 1 regiment of Tyrol riflemen, 33 battalions of riflemen. 2. Cavalry: 14 regiments of dragoons, 13 regiments of uhlans, 14 regiments of hussars. 3. Artillery: 12 regiments of field artillery, 12 battalions of for-

ress artillery. 4. Two regiments of engineers and one regiment of pioneers. 5. Five corps for military transportation. Among the fortresses of Austria, Comorn, Olmütz, Peterwardein, and Temesvár are the strongest. The best naval ports are Pola, Trieste, and Cattaro. The Austrian navy in 1871 consisted of 47 steamers, among which were 11 ironclads, 20 sailing vessels, and 6 tenders; in all 72 vessels, carrying 522 guns. The corps of naval officers embraces 2 vice admirals, 5 rear admirals, 16 captains of ships of the line, 17 captains of frigates, and 18 captains of corvettes.—The present archduchy of Austria, anciently inhabited by the Celtic tribe of the Taurisci, afterward called Norici, was conquered by the Romans in 14 B. C. During the first centuries of the Christian era that portion of Austria north of the Danube belonged to the possessions of the Marcomanni and Quadi; part of Lower Austria and Styria, including the municipium of Vin-dobona (Vienna), to Pannonia; the rest of Lower Austria and Styria, with Carinthia and part of Carniola, to Noricum; Tyrol to Rætia. After the middle of the 6th century the river Enns constituted the boundary between the Teutonic nation of the Boioarii (Bavarians) and the Turanian Avars. Charlemagne annexed the country of the Avars to the German empire in 791. It was then called Avaria or Marchia Orientalis (eastern territory), and subsequently Austria, constituting since 843 the easternmost district of Germany. Having been conquered by the Magyars in 900, it was ultimately reannexed to Germany by Otho I. in 955. In 988 Leopold of Babenberg was appointed margrave of Austria. His dynasty remained in possession for 268 years, adding largely to its territory by the annexation of Styria and Carniola, by conquests from the Slavic tribes, and by inheritance. Under the reign of Henry Jasomirgott Austria was erected into a hereditary duchy in 1156. On the death of Frederick II., the last of the Babenberg dynasty (1246), the German emperor Frederick II. claimed Austria as a vacant fief of the imperial crown. But neither he nor his son Conrad IV. succeeded in establishing his authority, and in 1251 the Austrian states elected Ottocar, second son of the Bohemian king Wenceslas, duke of Austria and Styria. Having refused to acknowledge Rudolph of Hapsburg as German emperor, Ottocar was defeated by him in 1276, and compelled to surrender to the victor all his possessions except those belonging to the Bohemian crown. From that time up to the present day the house of Hapsburg, whose original possessions were in Switzerland, has ruled in Austria. Rudolph's son and successor Albert obtained in 1301 the Swabian margraviate. At his death in 1308 Austria had already an area of 26,000 sq. m. Of his five sons, Leopold was defeated at Morgarten in 1315, while attempting to resubdue the revolted Swiss cantons, and Frederick III., surnamed the Handsome, was vanquished by Louis the Bavarian in his

fight for the imperial crown in 1322. The possessions of their house, which were divided by them, were finally united in the hands of the fourth brother, Albert II. But another division took place among the heirs of the latter, when Albert III. got Austria proper, and Leopold all the rest. Leopold was slain in battle against the Swiss at Sempach in 1386, but his descendants remained in possession of Styria, and inherited the duchy of Austria in 1457, when Albert's line became extinct. Frederick IV. of Austria, having been elected German emperor, elevated Austria to the rank of an archduchy. His son Maximilian I., who succeeded him in 1493, obtained the Netherlands by marrying Mary, the heiress of Charles the Bold of Burgundy, and Tyrol by inheritance; and by marrying his son Philip to the daughter of Ferdinand and Isabella he brought the Hapsburg family upon the throne of Spain. Philip's son, Charles I. of Spain, became, under the name of Charles V., German emperor in 1519. In 1520 and 1521 the latter ceded the Austrian possessions to his brother Ferdinand I., who subsequently also succeeded him in the empire. Ferdinand obtained the kingdoms of Hungary and Bohemia as successor, by family treaties as well as elections, to his brother-in-law, King Louis II., who fell in the disastrous battle of Mohács against the Turks (1526). Thus elevated to the rank of one of the great European powers, the house of Austria possessed an area of 114,000 sq. m. But the possession of Hungary was not undisputed. John Zápolya, waywode of Transylvania, aided by the Turks, tried to wrest the crown of St. Stephen from Ferdinand; and in 1529 Sultan Solymán had already invested Vienna, when the prudent generalship of Count Salm compelled him to retire. By a treaty concluded in 1538, Zápolya got eastern Hungary and the title of king, while the possession of Transylvania was guaranteed to his descendants. Even after Zápolya's death (1540) Ferdinand could reënter into possession of lower Hungary only by paying an annual tribute of 30,000 ducats to the Turks. The war with the latter had soon to be renewed, however, and Hungary remained a battlefield for more than a century. (See HUNGARY.) In 1564 Austria was once more divided among Ferdinand's sons, Maximilian II. (German emperor 1564-'76) obtaining Lower Austria, Hungary, and Bohemia; Ferdinand, Tyrol and Upper Austria; Charles, Styria, Carinthia, Carniola, and Görz. The final reunion took place about 100 years later. Rudolph II., successor to his father Maximilian (1576-1612), one of the feeblest and worst emperors Germany ever had, was compelled to cede Bohemia, Hungary, and Austria to his brother Matthias, under whose reign (1612-'19) the 30 years' war originated, by the revolt of the Bohemian Protestants against the Hapsburg dynasty. Ferdinand II. of Styria, cousin of Matthias (emperor 1619-'37), having defeated the rival king elected by the Bohemians, Frederick

of the Palatinate (1620), led a war of extermination against the Protestants of Bohemia and Moravia, expelled them by thousands from his dominions, and annulled all ancient privileges of the states. In the course of the war, Ferdinand, shortly after the assassination of Wallenstein, was compelled to cede Lusatia to Saxony (1635). Ferdinand III. (1637-'57) brought the war to an end by the peace of Westphalia (1648). His son, Leopold I. (1657-'705), by his misrule drove the Hungarians into alliance with the Turks. In 1683 Kara Mustapha besieged Vienna, which was saved only by the timely arrival of a Polish army, led by John Sobieski. Leopold's armies having reconquered Hungary, it was converted from an elective kingdom into an hereditary one (1687). Transylvania, too, was occupied. In 1699 Turkey, defeated in many sanguinary battles by Prince Eugene, ceded, by the peace of Carlowitz, the country between the Danube and Theiss rivers to Austria. Leopold's design to obtain the succession in Spain for his second son, Charles, was frustrated by the diplomacy of Louis XIV. of France. This occasioned, on the death of Charles II. of Spain (1700), the war of the Spanish succession, in which England, the Netherlands, Portugal, and Savoy took sides with the emperor against France, while Louis XIV. was aided by a powerful insurrection in Hungary, under Rákóczy. The victories of Eugene and Marlborough rendered success certain when, by the death of Leopold and of his eldest son Joseph I. (1711), his brother Charles became monarch of Austria. The allies, fearing the preponderance of Austria if the crowns of Spain, Naples, and Germany should be united again, desisted from their efforts against France, and a peace was concluded at Utrecht in 1713, by which the Spanish Netherlands, Milan, Naples, and Sardinia (exchanged for Sicily in 1720) fell to Austria, while Philip of Anjou, grandson of Louis XIV., was acknowledged as king of Spain. By this treaty the area of Austria was increased to 191,000 sq. m. The treaty of Passarowitz (1718) secured new advantages on the Turkish border. Having once more waged war with France and Spain, Charles VI. lost Naples, Sicily, and a portion of Milan (1735); while the peace of Belgrade (1739) deprived him of nearly all the fruits of Prince Eugene's victories over the Turks. All these sacrifices Charles consented to, principally from a desire to obtain the general recognition of the so-called "pragmatic sanction," by which his daughter, Maria Theresa, was declared the heiress of the Austrian monarchy. Yet, immediately after his death (1740), her right of succession was contested by the leading powers, England excepted. Frederick II. of Prussia seized Silesia, which formed a part of the Bohemian dominions of Austria, and the elector of Bavaria assumed the title of archduke of Austria, and was elected German emperor, under the name of Charles VII. (1742). Noth-

ing but the fidelity of the Hungarians saved Maria Theresa. By the treaties of Breslau and Dresden (1742 and 1745), she resigned her claims to Silesia; by that of Aix-la-Chapelle (1748), to Parma, Piacenza, Guastalla, and part of Milan. In the mean time the emperor Charles VII. had died (1745), and Maria Theresa's husband, Francis Stephen, grand duke of Tuscany, belonging to the ducal family of Lorraine, had been elected German emperor, as Francis I. In order to get Silesia back from Prussia, Maria Theresa conspired with France, Russia, Saxony, and Sweden against Frederick; but the seven years' war, in which Frederick covered himself with glory, resulted only in the reaffirmation of the *status quo*. Francis, who died in 1765, was succeeded as emperor by his son Joseph II., who in Austria acted only as assistant regent until the death of his mother (1780). During this period eastern Galicia and Lodomeria were taken forcibly from Poland (1772), the Bukovina was obtained from Turkey (1777), and some smaller possessions were acquired in Germany by the peace of Teschen (1779), increasing the Austrian dominions altogether to an area of 233,741 sq. m. Joseph II., reversing the traditional policy of his predecessors, granted religious liberty to Protestants, discontinued the censorship of the press, reorganized public education, abolished 900 convents, and developed industry by a protective tariff; but his arbitrary measures exasperated the Hungarians, and drove the Austrian Netherlands into rebellion. The latter he tried to exchange for Bavaria, a project which was frustrated by the efforts of Frederick of Prussia. No less unfortunate in his war against Turkey, Joseph died from grief (or, as some believed, from poison) in 1790. His brother, Leopold II. (1790-'92), reconciled Hungary and the Netherlands, made peace with Turkey, and entered into the coalition against revolutionary France, but was unable to rescue his sister, Marie Antoinette. Thus his son Francis (1792-1835) was, immediately on his accession to the throne, drawn into the whirlpool of the revolutionary wars. By the peace of Campo Formio (1797) he lost Lombardy and the Netherlands, but obtained in exchange a large portion of Venetia. Two years before he had obtained western Galicia by the third partition of Poland. In 1799 Austria, allied with Russia, declared war against the French republic for the second time, but was compelled by Bonaparte to accept the peace of Lunéville (1801), by which his brother, the archduke Ferdinand, was deprived of Tuscany, being compensated by Salzburg, Passau, Eichstadt, and the title of prince-elect. The public debt of Austria had now increased to 1,200,000,000 florins. On Aug. 11, 1804, Francis proclaimed himself hereditary emperor of Austria (as such Francis I.), uniting all his dominions under the name of the Austrian empire. In the next year, having again gone to war with France, he was forced by the defeat at Austerlitz to sign a most igno-

minious peace at Presburg (Dec. 26, 1805). When, by the organization of the Rhenish confederation (Rhinebund), under the auspices of Napoleon (1806), the integrity of the German empire had been destroyed, Francis laid down the imperial crown of Germany (Aug. 6, 1806). A fourth time he determined upon a war against Napoleon, aided only by England (1809), but the result was most disastrous. The peace of Vienna (Oct. 14, 1809) took away from Austria about 42,000 sq. m. of territory, with 8,500,000 inhabitants. Utterly prostrated and driven into bankruptcy, Francis did not dare to withhold his consent when Napoleon proposed to marry his daughter Maria Louisa (1810), and in 1812 he even entered into alliance with Napoleon against Russia. But when the Russian campaign had broken Napoleon's power, and Prussia had risen against him, Austria joined in the alliance of England, Russia, Prussia, and Sweden (1813), and took a conspicuous part in the overthrow of the French empire. By the peace of Paris (1814) the Lombard and Venetian territories, now united into a kingdom, and all former possessions returned to Austria. In 1815 Francis, with Alexander of Russia and Frederick William III. of Prussia, formed the "holy alliance," for the restoration of the old monarchical system, Vienna having in the preceding year become the seat of the congress convoked for the purpose of reconstructing Europe. The suppression of liberal ideas and movements throughout Europe appeared to be thenceforth the principal object of the Austrian government, of which Prince Metternich was the soul. Austria quelled the popular insurrections in Naples and Piedmont (1820 and 1821), aided by its diplomacy in the suppression of the popular movement in Spain (1823), favored Turkey in its struggle with the Greeks, and crushed the insurrections which in Italy followed close upon the French revolution of 1830. In the interior new attempts were made, though without success, to subvert the constitution of Hungary. The death of Francis, who was succeeded by his son Ferdinand (1835), made no change in the Austrian administration. At an interview of Ferdinand with the monarchs of Russia and Prussia the holy alliance was reaffirmed. In the oriental imbroglio of 1840, Austria sided with England and Russia. Unrelenting rigor was exercised in Italy. The Polish insurrection in Cracow (which in consequence was annexed to Austria) was accompanied by an attempt at rising in the adjoining parts of Galicia (February, 1846); but the government succeeded in quelling the movement by instigating the wrath of the peasants against the noblemen, many of whom were massacred. In the Italian provinces the opposition was fostered by the political reforms of Pope Pius IX., and the concessions to popular opinion wrung from the other Italian governments. In Hungary the former parliamentary opposition of the diet had gradually grown into national enmity, es-

pecially so since the death of the palatine, Archduke Joseph (1847); similar movements appeared in Bohemia, while even in Austria proper the states insisted upon some participation at least in the administration of the government. From all these elements a storm arose in 1848 which brought the entire Austrian monarchy very near its ruin. On March 18, shortly after the revolution in Paris which drove Louis Philippe from his throne, the people of Vienna rose against the ministry, which made but a feeble show of resistance; Metternich was compelled to resign, and the emperor pledged himself to convoke an assembly of representatives of the people, to form a constitution for the empire. But at the same time the Hungarian diet, led by Kossuth, demanded and obtained an independent constitutional government, leaving merely a dynastic union with Austria. Outbreaks in Italy followed closely; Radetzky was driven from Milan, and Pálffy surrendered Venice to the people. While thus momentarily successful in the provinces, the revolution created the direst confusion in the centre of the empire. Of the revolutionists, some were in favor of uniting those provinces in which the German nationality predominates to Germany, leaving Hungary to herself, and favoring the union of the Italian states under a national government; while others were unwilling to hazard the position of Austria as one of the great powers, against the vague hope of a reconstruction of Germany. In Vienna the ministry of Count Fiquelmont, which had succeeded Metternich, proved its incapacity to grapple with the pending difficulties, and the political power fell into the hands of a central committee of the national guard and the students' legion. The emperor, unwilling to resort to extreme measures, fled to Innsbruck (May 17). Another unsuccessful attempt of the ministry to break the power of the students led to the organization of a committee of public welfare (May 25), which, until the meeting of an Austrian parliament (July 22), exercised an almost unlimited control, compelling the ministry to make room for successors more subservient to the masses (July 8). When utterly prostrated in the capital, the imperial power began to gather strength in the provinces. A popular outbreak at Prague was suppressed, after a bombardment of the city (June 15-16), by Prince Windischgrätz. In Lombardy, Radetzky, who had retired to Verona, opened an aggressive campaign in June, captured Vicenza, Padua, and other important places, and routed the Sardinian army (the king of Sardinia, Charles Albert, having taken sides with the revolted provinces) near Custozza, July 25. The national Hungarian ministry of Bathányi and Kossuth, preparing the way for an independent Magyar kingdom, awakened the fears and national antipathies of the Slavic races which would necessarily have formed part of this kingdom. Jellachich, the governor (*ban*) of Croatia, strengthened by the conni-

vance of the imperial court, pronounced against the Hungarian government. Count Lamberg, the imperial commissioner despatched to Pesth, was there killed by the people (Sept. 28). Immediately the emperor ordered the dissolution of the Hungarian diet, and appointed Jellachich supreme military commander of Hungary. The diet, denying the authority of the emperor, organized a committee of safety, with Kossuth at its head. When the garrison of Vienna (Oct. 6) was departing for Hungary, the people of the capital, sympathizing with the Hungarians, rose once more. They took the arsenal, and hung the secretary of war, Count Latour, at the window of his office. The parliament declared itself permanent, and sent an address to the emperor asking for a new ministry and the removal of Jellachich. The emperor, who in June had returned from Innsbruck to Vienna, again fled to Olmütz. The masses of the capital armed themselves under the leadership of the Polish general Bem, preparing to resist the impending attack of the army. The garrison, joined outside the city by the remnants of the army of Jellachich, which had been beaten near Buda, and by the army corps of Prince Windischgrätz, assaulted Vienna, Oct. 23; but the people made a desperate resistance until the 31st, when, the Hungarians having the day before been defeated almost before its gates, the city was taken by storm with immense slaughter. Many of the popular leaders were shot, among others Robert Blum, member of the parliament of Frankfurt, Messenhauser, commander of the national guard, and Jellinek, editor of the "Radical." On Nov. 22 a new ministry was formed, of which Prince Felix Schwarzenberg was president. The emperor Ferdinand was induced to resign, Dec. 2, 1848, in favor of his nephew, Francis Joseph, a youth of 18 years, whose mother, the archduchess Sophia, had been the leading spirit of the counter-revolutionary movement. The campaign against Hungary was commenced at once, but carried to a successful termination only by the powerful intervention of Czar Nicholas, the Hungarian main army, under Görgey, surrendering (Aug. 13, 1849) to the Russians at Világos. (See HUNGARY.) Hungary, which had declared its independence, was treated as a conquered country. Many military and parliamentary leaders were shot or hung, and the prisons crammed with the unhappy victims of imperial revenge. Simultaneously with these occurrences the war in Italy had been terminated. Within a few days Gen. Radetzky routed the Sardinian army twice, at Mortara (March 21, 1849) and Novara (March 23), and obtained a peace by which Sardinia was obliged to reimburse Austria for the expenses of the war (15,000,000 livres). Venice, where an independent republican government had been organized under the lead of Manin, was invested by Radetzky, and forced to surrender, Aug. 23, 1849.—The revolution having been con-

quered, the Austrian government commenced the arduous task of reorganizing the monarchy upon a firmer basis than before. The parliament, which after the bloody struggle at Vienna had been adjourned to Kremsir in Moravia, was dissolved March 4, 1849, and a constitution promulgated by the free will of the emperor, of which only the reactionary parts went into operation. The efforts of the national parliament at Frankfort to reconstruct the German empire, excluding Austria from it, were violently opposed by the Austrian government, and Frederick William IV. of Prussia durst not defy this opposition, backed as it was by that of Russia and France, by accepting the imperial crown offered by the Frankfort assembly. Still, by assuming the leadership of the counter-revolutionary movements in Germany, and aiding the petty princes to put down the people, Prussia obtained a preponderating influence in northern Germany, and made some efforts to centralize the confederacy, all of which were prostrated by the energetic policy of Prince Schwarzenberg. In 1850 the diplomatic conflict between Austria and Prussia seemed to point to a crisis; armies were put in motion, and a fight among some outposts had already taken place near Bronzell in Hesse-Cassel (Nov. 8, 1850), when at the last moment Prussia, in a ministerial meeting at Olmütz (Nov. 29), submitted to the demands of Austria, and the German diet at Frankfort was reestablished the same as it was before 1848; Austria, on her part, renouncing for the time being the idea of entering into the Germanic confederation with all her possessions. The energy displayed in the management of foreign relations was manifested by the Austrian minister of the interior, Bach, in the administration of the internal affairs of the empire. All remnants of the revolutionary period were annihilated, with one exception only, the abolition of sillage. The constitution of 1849 was annulled Jan. 1, 1852; trial by jury was abolished; the public press crushed down with the utmost severity; and the influence of the clergy reestablished. Extraordinary efforts were made to develop the resources of the monarchy by encouraging agriculture, industry, and commerce. A new tariff was adopted, and negotiations were commenced with other German states for the establishment of a complete customs union with the Zollverein. Prussia, fearing lest her influence might be outweighed by that of Austria, opposed this movement; but several of the Zollverein states took sides against her, and the moment seemed to be near at hand when her objections would have been overborne, when Schwarzenberg's sudden death (April 5, 1852) brought on a change in the policy of Austria. His successor, Count Buol-Schauenstein, declined to press the propositions made by Schwarzenberg, and contented himself with the conclusion of a commercial treaty between Austria and the Zollverein (1853). The reconciliation with Prussia

was completed at a personal interview of the emperor and Frederick William IV. On Feb. 6, 1853, another popular outbreak occurred at Milan, but was suppressed without difficulty. A diplomatic rupture with Switzerland, where the Italian revolutionists had taken refuge, was the consequence. On Feb. 18 an attempt was made against the emperor's life by a young Hungarian, Libényi. These events were important only so far as they tended to perpetuate the severe military rule. When, toward the end of 1852, the Montenegrins rose against the Turks, Austria sided with them, and Count Leiningen, who was sent to Constantinople (February, 1853), obtained full redress of their grievances.—At the time of the complications which led to the Crimean war, Austria proclaimed her neutrality, and on April 20, 1854, a treaty was concluded by Austria and Prussia, both pledging themselves to take an active part in the war only whenever the interests of Germany should appear to be endangered. The czar, indignant at what seemed to him base ingratitude on the part of Austria, endeavored by flattery to incite the smaller German states against her, and went even so far as to threaten an appeal to the Slavic races. Thus Austria was forced to change her neutrality pure and simple into an armed one. She agreed with Turkey to occupy the Danubian principalities, advanced an army of 300,000 men toward the Polish frontier, and proposed to Russia the four points which afterward became the basis of peace. This proposition having been rejected, Austria assumed an attitude so threatening that the Russians were obliged to retire from Turkish territory. An Austrian army under Gen. Coronini entered Wallachia, and the war on the Danube was virtually at an end. By promising to the western powers an active support whenever they would pledge themselves to carry on the war in such a manner as effectually to cripple the Russian power, Austria induced them to determine upon the Crimean expedition. Now, at last, the active cooperation of Austria seemed to be certain; indeed, a treaty to that effect was agreed to by her Dec. 2, 1854; but in consequence of the tardy success of the allied armies before Sebastopol and the unwillingness of the other German powers to accede to the treaty, she again fell back upon her former vague promises, merely offering her good offices to the contending parties. Not even when the Russians once more invaded Turkish territory did she move against them. Plenipotentiaries of the belligerent powers met at Vienna in March, 1855, but were unable to agree upon a basis of peace, and finally adjourned. During the progress of the negotiations Austria had distinctly pledged herself to go to war if Russia should remain obstinate, when all at once she began to reduce her army on the frontier. Financial embarrassments and the cholera, which within a few months destroyed 25,000 soldiers, were the ostensible cause for this unexpected move-

ment, the real cause being probably the assurance given by Russia that in any case she would adhere to those of the four points which involved the special interests of Austria. The emperor of the French, who formerly had been anxious to secure the friendship of Austria on any terms, began to look toward Russia, and eagerly seized the first opportunity of concluding peace (1856). During the war the work of centralization had been carried on by the Austrian government with apparent success. By the concordat with the holy see (1855) Austria gave back to the Roman Catholic clergy all the privileges and influence which had been wrested from them since the time of Joseph II. By stimulating public enterprise and promoting the material interests of all classes of the population, the government was earnestly endeavoring to make the people forget the events of 1848 and 1849. The military rule was somewhat relaxed, and a general amnesty was proclaimed for political offences.—The progress of internal reforms was soon again interrupted by foreign complications. At the beginning of 1859 the Austrian statesmen learned from some ominous words addressed on new year's day by the French emperor to Baron Hübler that Cavour had succeeded in gaining over Louis Napoleon to the designs of Victor Emanuel, and that they must be prepared for a war not only against Sardinia but against France. In this new complication the sympathies of Prussia and the other German states were strongly enlisted in favor of Austria, and even England and Russia showed a readiness to shield her from the impending danger. The diplomatic efforts of the neutral powers were, however, thwarted by an ultimatum which Austria hastened to address to Sardinia. This ultimatum not being accepted, Austria declared war, and appointed one of her most incompetent generals, Count Gyulay, commander-in-chief. The hope of the Austrians that they could overpower the Sardinian army before the French could come to its aid was not fulfilled. The Sardinian territory, which Count Gyulay had invaded on April 29, had soon to be evacuated. The victory of the united French and Sardinian armies at Magenta, June 4, compelled the Austrians to abandon also Lombardy and to retire upon their famous quadrilateral, Mantua, Verona, Peschiera, and Legnago. After a second defeat at Solferino, June 24, the Austrians deemed it best to make peace with Louis Napoleon. An offer of Prussia to take up arms as an ally of Austria, in defence of the treaties of 1815, was regarded as unacceptable because Prussia insisted on having in this case the chief command of all the non-Austrian German contingents. Austria consented in the preliminary peace of Villafranca (July 11), and in the definitive peace of Zürich (Nov. 10), to the cession of Lombardy. Napoleon, to whom the cession was made, transferred it in the peace of Zürich to Sardinia. The promises made by Sardinia that the dethroned dynasties of Tuscany, Mo-

dena, and Parma should be restored, and that the Italian states should form a confederation into which Austria should be admitted on account of Venetia, were never fulfilled.—The disastrous issue of the war was followed by new convulsions in the interior. Public opinion seemed generally to be agreed that the empire was in an untenable condition, and that sweeping reforms were needed. The ministers of foreign affairs and of the interior, Count Buol-Schauenstein and Bach, who were regarded as the chief representatives of the ruling policy, had to resign, but no other changes of importance were made. The financial troubles again made themselves felt, and a new loan of 200,000,000 fl., which was to be raised by a national subscription, proved a complete failure. A first attempt to reorganize the administration of the empire was made by the imperial patent of March 5, 1860, which gave to the Reichsrath a limited right of coöperation in the legislation and in the control of the finances. When the Reichsrath, the number of whose members had been increased, met in June, its majority agreed with the new minister of the interior, Count Goluchowski, in advising the abandonment of the centralizing and the adoption of a federalistic policy. The emperor fulfilled this wish by the publication of the imperial diploma of Oct. 20, 1860 (the *October-Diplom*), which conferred upon the diets of the several crown lands the right of legislation on all affairs save those expressly reserved for the Reichsrath. The latter class embraced only the finances of the empire, and the foreign, war, and commercial affairs. The Reichsrath was in future to consist of 100 members elected by the provincial diets, and of the members appointed by the emperor. The novel constitution which Austria was to receive by this diploma failed to be acceptable to any party. To the Poles of Galicia and the Czechs of Bohemia, who demanded complete autonomy, it did not go far enough in the direction of federalism. Hungary insisted on the unconditional restoration of its constitution. The German liberals demanded, on the one hand, a more popular composition of the Reichsrath, and on the other, a greater centralization, as the excessive rights conferred upon the crown lands must in the natural course of development lead to a dissolution of the empire. Their arguments made an impression upon the court; Count Goluchowski was dismissed in December, 1860, and succeeded by Schmerling, who in 1848, as minister of the German empire during the regency of the archduke John, had acquired the reputation of an able and liberal statesman. The imperial patent of Feb. 26, 1861 (the *Februar-Patent*), which soon followed the appointment of Schmerling, resumed the work of welding all the discordant provinces of the polyglot empire into a strongly consolidated, truly constitutional monarchy. The Reichsrath, which received all the usual rights of parliaments, was to consist of a *Herrenhaus* or house

of lords, and a house of deputies numbering 343 members. Affairs common to the non-Hungarian provinces were to be acted upon by the non-Hungarian members as "limited Reichsrath" (*Engerer Reichsrath*). The first session of the new Reichsrath (May, 1861) was attended by deputies from all the German and most of the Slavic provinces; but Hungary, Croatia, Transylvania, and Venetia were not represented. All the efforts of the government to induce these crown lands to send deputies proved fruitless. In Hungary, in particular, all parties united for a "passive resistance." The Saxons and Roumans of Transylvania were prevailed upon in 1863 to take part in the Reichsrath; but soon the Czechs of Bohemia and Moravia refused a further attendance. The proceedings of the Reichsrath did not make a favorable impression upon the public mind, and the annual deficits continued to swell the public debt to a fearful amount. Schmerling finally saw the impossibility of carrying through his plans, and resigned in June, 1865. The prominent feature of the foreign policy of Austria during the administration of Schmerling was the struggle for her continued ascendancy in the German confederation, which appeared to be threatened by the growing power of Prussia. Schmerling endeavored to secure the admission of all the dominions of Austria into the German confederation and the German Zollverein, but in vain. In order to gain the sympathy of the liberals throughout Germany, who it was thought had been alienated from Prussia by the policy of Bismarck, the Austrian government proposed a liberal reformation of the federal diet. An invitation from the emperor Francis Joseph to the German princes and the burgomasters of the free cities to assemble in Frankfort on Aug. 17, 1863, for the discussion of this question, was accepted by all those invited except the king of Prussia, whose opposition proved sufficient to foil the plan. Notwithstanding these repeated humiliations by Prussian diplomacy, the Austrian minister of foreign affairs, Count Rechberg, soon after accepted a proposition from Prussia that the Schleswig-Holstein difficulty be regulated by the two great German powers, and not, as the national party in Germany desired, by the federal diet. Austria accordingly took part in the Schleswig-Holstein war, finally terminated on Oct. 30, 1864, by the peace of Vienna, in which Christian IX. of Denmark ceded the duchies of Schleswig, Holstein, and Lauenburg to the emperor of Austria and the king of Prussia. Soon, however, the Austrian court became suspicious of the Prussian alliance, which not only alienated the middle states from Austria, but threatened her with new diplomatic humiliations. A falling out of the two powers, and even the outbreak of hostilities, was seriously feared; but it was for a time averted by the Gastein convention of Aug. 14, 1865, according to which Lauenburg was incorporated with Prussia, Holstein occu-

pied by Austrian and Schleswig by Prussian troops. Meanwhile the liberal Schmerling cabinet had been succeeded by one consisting of a combination of feudal federalists and old conservative Hungarians, with Count Belcredi, a Czech, as president. One of the first acts of the new ministry was the suspension of the constitution of February, 1861, under the pretext that a new attempt was to be made to come to a full understanding with Hungary. When the diets of the German and Slavic provinces were convoked in November, those of Galicia and Bukowina, as well as the Czech majority of the Bohemian diet, voted addresses of thanks to the emperor; while all the German diets, with the single exception of that of Tyrol, which was under the control of the "Catholic" party, demanded the recognition of the continued legal existence of the constitution of February. The Slavs generally rallied for the support of the new ministry, and the conflict between the Slavic and German nationalities assumed dimensions previously unknown. The negotiations with Hungary did not have the desired effect. Although the emperor on Dec. 14, 1865, opened himself the Hungarian diet, and although the Hungarians received him and the empress, who soon came likewise to Pesth, with unbounded enthusiasm, the majority of the diet insisted on greater demands than the emperor thought it compatible with the interests of the dynasty to concede. Before an understanding had been arrived at, the complications with Prussia reached a crisis. The governments of both Austria and Prussia were fully aware of the grave dangers connected with the solution of the Schleswig-Holstein question. Prussia meant to take the duchies herself; Austria supported the duke of Augustenburg. Early in 1866 both began to arm and to prepare for war. Austria endeavored to recover the sympathy of the middle states of Germany; Prussia, on April 8, concluded a defensive and offensive alliance with Italy. A motion of Austria in the federal diet of Germany (June 1, 1866) to have the claim of the prince of Augustenburg to Schleswig-Holstein decided by the federal diet, was declared by Prussia to be a violation of the Gastein convention. Prussian troops were immediately marched into the duchy of Holstein, which the Austrian commander, Gen. von Gablenz, yielding to superior numbers, hastened to evacuate. The majority of the federal diet, regarding these steps as disloyal demonstrations against the authority of the confederation, ordered (June 14), on motion of Austria, the mobilization of the entire army of the confederation with the exception of the Prussian corps. Prussia declared that this decree was a radical subversion of the fundamental principle of the confederation, and that she now considered the original pact as broken. Regarding the resolution as a declaration of war on the part of all the states which had voted for it, Prussia at once began its military operations. Feldzeugmeister

Benedek was appointed commander-in-chief of the northern and Archduke Albrecht of the southern armies of Austria. The Prussians advanced with a rapidity for which Austria and her allies were not prepared, and the troops of the smaller states proved as of old entirely inefficient. The Prussian progress through Saxony was undisputed, and the first serious encounter took place on Austrian soil. The military superiority of the Prussians soon became apparent; one Austrian corps after another was beaten, until on July 3 the bulk of their army suffered a crushing defeat at Sadowa near Königgrätz in Bohemia. This victory of Prussia filled the army of Austria, as well as the government and the population, with consternation. No halt was made in the retreat, and all the provinces north of Vienna were abandoned to the enemy. The government relieved Benedek of the chief command, which was transferred to the archduke Albrecht, who in the meanwhile had been entirely successful in the campaign in Venetia, having defeated the Italian army at Custozza (June 24) and driven it back across the Mincio. With him a part of his army was called to the northern seat of war. Hoping to detach Italy from the alliance with Prussia, the Austrian government had, moreover, on the day after the battle of Sadowa, ceded Venetia to Louis Napoleon, and requested his friendly mediation for bringing about peace. Italy declined to follow the advice of Napoleon, and, while the Prussians marched upon Vienna, again invaded Venetia and some districts of Tyrol. A naval victory of the Austrian admiral Tegetthoff at the island of Lissa (July 20) did not change the general prospects of the war, and had no influence upon the progress of the peace negotiations, which through the mediation of France had begun at Nikolsburg. A preliminary peace was concluded on July 26, which on Aug. 23 was followed by the definitive peace of Prague. Austria consented to the establishment of the North German confederation under the leadership of Prussia, and to the incorporation of Hanover, Hesse-Cassel, Nassau, Frankfort, and Schleswig-Holstein with the Prussian dominions. Between Austria and Italy a truce was concluded on Aug. 12, and a definitive peace on Oct. 3 at Vienna. Austria recognized the union of Venetia, which Napoleon had ceded to Victor Emanuel, as well as of Lombardy with the kingdom of Italy, while the Italian government agreed to assume the debt of Lombardy and Venetia, and 35,000,000 florins of the general Austrian debt, and also promised to restore to the dethroned princes of Tuscany and Modena, who were relatives of Francis Joseph, their private movable and immovable property.—Count Mensdorff, the minister of foreign affairs, and Count Maurice Esterházy, who was believed to be the chief adviser of the emperor, resigned their places in the ministry on Oct. 30. Mensdorff was succeeded by Baron Beust, who, as the representative of Saxony

in the federal diet, had gained the reputation of being the ablest opponent of the Prussian policy among the statesmen of the middle states. Beust soon submitted a novel plan for the reconstruction of Austria. He was as much opposed to the centralism of Schmerling as to the feudal federalism of Belcredi, and in the place of both recommended a strictly dualistic basis as the best remedy for the evils which had brought Austria to the brink of an unfathomable abyss. As the hope of Belcredi and his old conservative Hungarian friends to effect a reconciliation with Hungary was disappointed, Beust found a favorable hearing for his ideas. The main point of his programme was a lasting reconciliation with Hungary, and to that end the adoption of the propositions which Deák, the recognized leader of the majority of the Hungarian diet, had made to Belcredi. Beust advised the emperor to appoint at once a Hungarian ministry, and to obtain through it the consent of the Hungarian diet to the draft of the agreement between Cisleithan and Transleithan Austria, as proposed by Deák; to call then, in accordance with the constitution of February, 1861, a meeting of the "limited Reichsrath" of Cisleithania, lay before it the agreement with Hungary as an accomplished fact, and to propose to it such changes in the constitution of February as the concession made to Hungary would require. The advice was accepted; Belcredi resigned, and on Feb. 7, 1867, Beust was appointed prime minister. Within one month the most important points had been settled. Hungary abandoned the idea of a purely "personal union," and agreed to have the army and the foreign affairs in common with Cisleithania; it also promised a revision of the laws of 1848. On the other hand, the subordination of Croatia to the Hungarian ministry and the reincorporation of Transylvania with Hungary were readily conceded. The Hungarians were notified of the accomplished agreement and of the appointment of a responsible Hungarian ministry, of which Count Julius Andrassy was the president, by rescripts dated Feb. 17, 1867, and signed by Francis Joseph as "king of Hungary." On the next day, Feb. 18, the provincial diets of all the German and Slavic crown lands were opened. The German diets generally declared themselves satisfied with the settlement of the Hungarian question; most of the Slavic diets showed themselves at least not irreconcilable; but the Czechs of Bohemia so violently opposed the projects of the government that the Bohemian diet had to be dissolved. The Czech leaders were so incensed at the new turn of Austrian politics that they used the so-called ethnographical exhibition at Moscow (May, 1867) as a welcome occasion for an ostentatious display of Pan Slavistic tendencies. The Reichsrath of the German and Slavic provinces, which was opened on May 22, 1867, formally approved the agreement concluded with Hungary, but at the

same time declared that the Cisleithan provinces would not be fully satisfied until they should receive the same guarantee of their constitutional rights which had been given to the Hungarians. The majority of the Reichsrath demanded, in particular, a revision of the concordat, which in the opinion of the liberal party gave to the pope and the bishops privileges not compatible with a constitutional monarchy. The numerous manifestations for and against a revision of the concordat produced a profound agitation; but, though Beust unmistakably leaned toward the side of the liberals, he prevented definite action on the subject. On June 8 Francis Joseph was solemnly crowned as constitutional king of Hungary in the ancient capital, Buda. The relations with foreign powers remained peaceful; neither the publication of the secret treaties which Prussia after the peace of Prague had concluded with the south German states, nor the visit of the French emperor (August, 1867) at Salzburg, who desired to bring about an anti-Prussian alliance, could shake Beust's conviction that the preservation of peace was indispensably necessary for completing the work of reorganization at home. The greatest difficulty in the negotiations between the two delegations which had been appointed by the Reichsrath and by the Hungarian diet for regulating the relations between the two great divisions of the empire, was the proportionate distribution among them of the expenditures for the common affairs of the empire and of the public debt. The agreement finally arrived at, according to which 70 per cent. of the expenditures and debt was to be borne by the Cisleithan provinces, and 80 per cent. by Hungary, met with a strong opposition in the Reichsrath, as it was regarded to be too partial to Hungary; but the conviction that a full understanding with Hungary was necessary for the definite reconstruction of Cisleithan Austria upon a constitutional basis outweighed all other considerations, and in December, 1867, all the propositions of the two delegations were agreed to. Both houses of the Reichsrath in the meanwhile (the lower house on Oct. 17, the upper on Dec. 2) had adopted four fundamental laws of the state (*Staatsgrundgesetze*), which in many points modified the constitution of February, 1861, and secured to the Cisleithan provinces a truly constitutional form of government. The laws were sanctioned by the emperor on Dec. 21; and then the reconstitution of the empire on the dualistic basis of a division into Cisleithan and Transleithan provinces was completed. On Dec. 24 the emperor appointed an imperial ministry (*Reichsministerium*) for the common affairs of the empire, consisting of Count Beust as minister of foreign affairs, Herr von Becke as minister of finance, and Gen. von John as minister of war. The first ministry of Cisleithania was announced in the official gazette of Vienna on Jan. 1, 1868. Prince Carlos-Auersperg was its president, and among

its members it counted some of the prominent leaders of the liberal party in the Reichsrath, such as Dr. Giskra, minister of the interior, Dr. Herbst, minister of justice, and Dr. Brestel, minister of finance. Beust, upon whom the emperor in recognition of his services had conferred the titles of count and chancellor of the empire, remained for nearly four years (December, 1867, to November, 1871) at the helm of the foreign affairs of the empire. During all this time the peaceable relations with other powers were not disturbed, and Beust gained at home and abroad the reputation of being one of the ablest statesmen of Europe. In July, 1870, the peaceable policy of Austria was put to a severe test by the outbreak of the war between France and Germany. The ministry of the empire, whose meetings at this time were also attended by the prime ministers of Cisleithania and Hungary, and presided over by the emperor, declared on July 18 in favor of an attentive neutrality, which, as Beust explained, did not exclude the duty of watching for the safety of the monarchy, and of providing against all possible dangers. The continuance of peace enabled the ministers of Cisleithania and of Hungary to devote their whole attention to internal reforms. One of the first acts of the Cisleithan ministers was to demand from all public officers an oath to support the constitution. The gaps which still existed in the constitution were gradually filled up. A law on the responsibility of the ministry was adopted by a large majority of both houses. The military offices which had been directly dependent upon the emperor were abolished. Thus the archduke Albrecht was relieved from the chief command of the army, and as inspector of the standing army placed under the minister of war. The command of the navy was taken from Archduke Rainer and conferred upon Admiral Tegetthoff. One of the most important reforms was the reorganization of the army on a basis substantially identical with that of the military organization of Prussia. The law, which passed the house of deputies by the large majority of 118 votes against 29 (Nov. 18, 1868), provided in particular for a general liability of all classes of the people to military service, and regulated the appointment to military offices. The financial condition of the empire steadily improved, and although the annual budgets were not yet free from deficits, the productivity and taxability of the country so rapidly advanced as to diffuse everywhere new confidence in the financial future of the empire.—But in spite of so much that looked encouraging, two great conflicts never ceased to darken the horizon of Cisleithan Austria. One of these concerned the regulation of the religious and school affairs. On May 25, 1868, the government sanctioned three laws adopted by both houses of the Reichsrath, which, in accordance with the views of the liberal party, abolished the jurisdiction of the ecclesiastical

courts over the marriage relations of Catholics, transferred the supreme direction and superintendence of the entire department of instruction and education to the state, and regulated the relations of the churches recognized by the state on the basis of equal rights. The papal nuncio in Vienna protested against these laws as a violation of the concordat, and the pope declared them to be null and void; but the government, while endeavoring to conciliate the bishops as much as possible, carried them through. Another important victory was gained by the liberal party in 1870, when the government declared the concordat of 1855 to be no longer valid. Still more important than this religious conflict was that between the different nationalities represented in the Reichsrath. The Czechs of Bohemia and Moravia demanded for the lands of "the crown of St. Wenceslas," by which they understood the provinces of Bohemia, Moravia, and Silesia, an autonomy equal or at least similar to that of Hungary, and including in particular a Czech parliament in the place of Czech deputies to the Vienna Reichsrath. The Silesian diet almost unanimously protested against these schemes; but in Bohemia and Moravia the Czech population gave them an enthusiastic support. As the Germans in 1868 controlled the diets of both Bohemia and Moravia, the Czech members in August resigned their seats, and presented to the presidents of the diets a declaration fully setting forth their views and plans. At the new election for the Bohemian diet all the 81 signers of the declaration, with but one exception, were reelected. They again refused to attend the diet convoked in September, 1869, as the German members were again in the majority. The Vienna government was willing to enter into negotiations with the Czechs; but the leaders of the latter, Rieger and Sladkowsky, declined to attend the conference which had been proposed by Giskra, and the representatives of the Czech nationality whom Count Potocki in April, 1870, called to Vienna, were equally unwilling to make any concessions. The success of Hungary and the Czech agitation strengthened the hope of the Poles of Galicia that they also might be able to obtain for the Polish parts of the empire an autonomy like that of Hungary, and that thus Galicia might become the nucleus of a restored Polish realm. Accordingly the diet, on Sept. 16, 1868, resolved to petition the emperor to give to the former kingdoms of Galicia and Lodomeria and to the grand duchy of Cracow a separate government, under the direction of a chancellor or special minister, who should be responsible to the diet. When the committee of the Vienna Reichstag declared the Polish demands to be inadmissible, the Polish members of the Reichsrath resigned, and their example was soon followed by the majority of all the Slavic deputies. An insurrection which in October, 1869, broke out in the Slavic province of Dalmatia, in the district of

Cattaro, had no connection with the nationality movements. The people of this district, which is separated from the remainder of Dalmatia by a high mountain ridge, and who number only 80,000 souls, had formerly been exempt from military service, and therefore made a forcible resistance to an attempt to enroll them, in accordance with the new military law, in the landwehr. After several bloody encounters, in which the imperial troops suffered severe losses, the insurgents submitted in January, 1870, when several concessions were made to them. In view of the alarming dimensions which the nationality conflicts assumed, the members of the Cisleithan ministry were themselves divided in their opinion as to the best policy to be pursued. The majority, to which the ministers Plener, Giskra, Herbst, Hasner, and Brestel belonged, were unwilling to make further concessions to the Czechs, Poles, and other non-German nationalities, and desired to strengthen the authority of the central Reichsrath by a reform of the electoral law. The three other ministers, Taase, Berger, and Potocki, favored concessions to the nationalities and to federalism. As the majority of both houses of the Reichsrath, which was opened on Dec. 13, 1869, sympathized with the majority of the ministry, the emperor in January, 1870, accepted the resignation of the minority. Soon, however, when the emperor refused to sanction several measures proposed by the new ministry which had been formed by Plener, a new ministerial crisis occurred, and Count Potocki was on April 4 commissioned to form another ministry. The overtures made by Count Potocki to the leaders of the Czechs and Poles, and the dissolution of the Reichsrath (May 23) and all the diets, produced an immense agitation, but the further development of the conflict was adjourned by the outbreak of the Franco-German war. The German centralists were not only dissatisfied with the cabinet of Potocki, but also with the chancellor, Count Beust, whom they likewise charged with making undue concessions to the nationalities. After the outbreak of the Franco-German war, the Austrian government gave new offence to the German Austrians by checking their enthusiastic demonstrations of sympathy with the cause of Germany. The Czechs and the Poles, on the other hand, made demonstrations in favor of France; and the leader of the Czechs, Dr. Rieger, even went so far as to make Napoleon a direct offer of an alliance between France and the Czechs, on condition that Napoleon should aid the Czechs in restoring the independent kingdom of Bohemia. The new kingdom was at once to embrace the Austrian provinces of Bohemia, Moravia, and Austrian Silesia, to which subsequently Prussian Silesia, Lusatia, and the Slovak districts of northern Hungary were to be added. In the new Reichsrath, which was opened on Sept. 5, the German liberals again controlled a majority of both houses. The provincial

diet of Bohemia, however, in which the united Czechs and federalists had a majority, declined to elect delegates to the Reichsrath. Although an imperial rescript of Sept. 29 made, in reply to an address from a Czech deputation of the Bohemian diet, promises of large concessions, such as the coronation of the Austrian emperors with the Bohemian crown and the indivisibility of the country, the Czechs persisted in their refusal. The government then ordered direct elections, by which 24 Germans and liberals and 86 adherents of the "declaration" were deputed to Vienna. The latter at once resigned their seats; but as both houses of the Reichsrath had a quorum, they soon passed a resolution declaring want of confidence in the ministry, which consequently tendered its resignation on Nov. 23. The emperor accepted the resignation, but the formation of a new cabinet was not accomplished until the beginning of the year 1871. The Czech leaders on Dec. 8 addressed, in the name of the "political nation of the Bohemians," a memoir to the Austrian chancellor, in which they explained their views on the foreign policy of Austria, and in particular declared their sympathy with Russia in the eastern question. On Dec. 14 the chancellor returned the memoir, informing the Czechs that the expression of such views exceeded their rights. On the other hand, a diplomatic correspondence of the most friendly character was begun in December with the government of Prussia, Austria waiving all opposition to the reconstruction of the German empire under the leadership of Prussia. The expected reorganization of the ministry took place on Feb. 7, 1871, under the presidency of Count Hohenwart. The new ministry leaned on the support of the Slavs and the feudal and Catholic parties. The Reichsrath declared itself dissatisfied with the policy of making concessions to the nationalities, but the emperor in stern words declared his approval. The majority of the Reichsrath, being divided in their opinions as to the best policy now to be pursued, granted the appropriations demanded by the ministry, and found some consolation in the fact that Chancellor Beust in the German as well as the Roman questions appeared to sympathize with the liberals. On the adjournment of the Reichsrath, on July 11, Count Hohenwart made some important concessions to the Czechs and the Poles. The latter appeared to be contented; but the Czechs insisted on the adoption of the whole of their demands. In August the ministry dissolved all the provincial diets in which the German centralists had a majority, and ordered new elections for the Reichsrath. The result gave to Count Hohenwart the assurance that now all the demands of the Czechs would be substantially granted, and the constitution as far as necessary be altered by the new Reichsrath. An imperial rescript to the Bohemian diet, which acknowledged "the rights of the Bohemian kingdom," caused unbounded enthusiasm

among the Czechs. A deputation from the Bohemian diet officially presented in Vienna the fundamental laws on which they desired the *Ausgleich* (agreement) to be based. This presentation brought on a new crisis. A crown council, composed of the Cisleithan ministers, the ministers common to the whole empire, and Count Andrassy, was called to advise the emperor. Both Count Beust and Count Andrassy so energetically opposed the policy of Hohenwart that the emperor took sides with them. As the Czech leaders refused to consent to any modification of their programme, Hohenwart resigned on Oct. 25. A month later a new Cisleithan cabinet favorable to the German centralists was appointed, under the presidency of Prince Adolph Auersperg. Again the diets opposed to the new ministry were dissolved and new elections for the Reichsrath ordered; and again the ministry succeeded in securing a ministerial majority in the new Reichsrath. The speech with which the emperor on Dec. 27 opened the Reichsrath announced that the government would accede to the wishes of Galicia in so far as they were compatible with the interests of the empire, and that measures would be taken to make the Reichsrath a completely representative body. On Feb. 20, 1872, the ministry and constitutional party (*Verfassungspartei*) gained a great triumph, as the Reichsrath by 104 against 49 votes adopted an additional clause to the electoral law which authorized the government to order direct elections if delegates elected by provincial diets should resign their seats or be prevented from entering the Reichsrath. Another great triumph was obtained by the ministry in Bohemia, where it controlled a considerable majority in the new provincial diet. Of the 54 delegates whom the new diet sent to the Reichsrath, 40 were supporters of the ministry, which could now rely on a two-thirds majority in the Reichsrath even if the Poles should not vote for it. The session of the diet was closed on June 23. The two great reforms, the introduction of which had been regarded as the chief task of the ministry, the substitution of direct election to the Reichsrath for the indirect election of the delegates by the provincial diets, and the *Ausgleich* (agreement) with the Poles, were not yet carried through. The ministry offered to the Poles far-reaching concessions, but at the same time declared that nothing would be conceded incompatible with the dualistic basis of the entire empire. The Poles in turn promised that in their struggle for an autonomy like that of Hungary they would keep within the bounds of the present constitution of the empire. (See GALICIA, and HUNGARY.)—Among the best historical works on Austria are Mailáth, *Geschichte des österreichischen Kaiserstaats* (5 vols., Hamburg, 1834-'50); Liechnowsky, *Geschichte des Hauses Habsburg* (8 vols., Vienna, 1836-'44); Springer, *Geschichte Oesterreichs seit dem Wiener Frieden* (2 vols., Leipsic, 1864-'5); Bidermann, *Geschichte der*

österreichischen Gesamtstaatsidee (vol. i., Innsbruck, 1867); Rogge, *Von Vilagos bis zur Gegenwart* (vol. i., Leipzig, 1872); *Archiv für Kunde der österreichischen Geschichtsquellen* (published by the Vienna academy of science, vols. i. to xlv., Vienna, 1848-'71).

AUSTRIA, an archduchy in the western half of the Austro-Hungarian monarchy, bounded N. by Bohemia and Moravia, E. by Hungary, S. by Styria and Salzburg, and W. by Salzburg and Bavaria; area, 15,056 sq. m.; pop. in 1871, 2,888,420. It is divided into two provinces or crown lands—Upper Austria (*Oestreich ob der Enns*) in the west, and Lower Austria (*Oestreich unter der Enns*) in the east, the river Enns forming part of the boundary between them.—

UPPER AUSTRIA has an area of 4,638 sq. m.; pop. in 1871, 735,622. The principal rivers are the Danube, which divides the province into two portions, the Enns, the Traun, and the Inn, tributaries of the Danube, and the Salzach, which flows into the Inn. In the S. W. are numerous Alpine lakes, some of them of considerable size. Mineral springs are found in various parts of the province, but few of them are of great value. The surface is mountainous. S. of the Danube the Norio Alps overspread the country, rising, in the group near Hallstadt, to the height of more than 9,500 ft. N. of the Danube the mountain system of Bohemia extends into the province, but attains no considerable altitude. The soil is exceedingly fertile in the valleys of the Danube and its tributaries, but elsewhere stony and dry. Even on the mountain slopes, however, the inhabitants have made it productive. The climate is bracing and cool, from the mountainous nature of the country. Agriculture and cattle-breeding are the principal occupations of the people. The salt works at Ischl and Hallstadt furnish an important industry, but the manufactures are not extensive, and consist chiefly of iron articles and cotton goods. Capital, Linz.—**LOWER AUSTRIA** has an area of 7,656 sq. m.; pop. in 1871, 2,000,602. The principal rivers are the Danube, Enns, Leitha, Krems, March, and Thaya. The S. portion is occupied by a part of the Norio Alps, with their branches; the chief of these are the groups of the Wienerwald or Kahleugebirg, a spur of which, the Schneeberg, is 6,760 ft. above the sea. N. of the Danube chains of hills extend into the country from Bohemia, but there are no considerable peaks. The valley of the Danube is here broad and fertile, and the smaller valleys of its tributaries, especially in the northern part of the province, also furnish large tracts of arable land. The climate is somewhat warmer than that of Upper Austria. Agriculture is not carried to the perfection attained in that province; but the manufactures are much more numerous and flourishing. They include machines of many kinds, carriages, wagons, optical, musical, and mathematical instruments, metal wares, articles of leather work, silk, woollen, and cotton goods.

Most of these are carried on in the neighborhood of Vienna. The province is intersected by several lines of railway, and there is a brisk trade with the neighboring states. Capital, Vienna.—The archduchy of Austria was the nucleus around which the empire of Austria (now the Austro-Hungarian monarchy) grew up. Lower Austria was founded as a margraviate in the time of Charlemagne; in 1156, joined with Upper Austria, it became a duchy, and in 1453 an archduchy. From this time the Hapsburgs steadily added to its territory, and it was soon merged in their increasing possessions.

AUSTRO-HUNGARIAN MONARCHY. See **AUTRIA**.

AUTAUGA, a central county of Alabama, bounded S. by the Alabama river; area, about 650 sq. m.; pop. in 1870, 11,623, of whom 7,292 were colored. The Selma, Rome, and Dalton, and South and North Alabama railroads pass through the county. The surface is uneven and the soil fertile. In 1870 the county produced 191,158 bushels of Indian corn, 86,660 of sweet potatoes, and 7,965 bales of cotton. There were two cotton factories and a cotton gin factory, producing articles to the value of \$681,733. Capital, Kingston.

AUTHENTICS, a Latin translation of the *Novella* of Justinian, so called by early writers from its being a literal translation of the original. The term was afterward applied to extracts of decisions from the *Novella* by which previous decisions or definitions contained in the Pandects or the Codex were modified or set aside. These extracts were made by doctors of the law and inserted in the *Corpus Juris*, but had no authority. The German emperors Frederick II. and III. issued in their names authenticis, and ordered the civilians of Bologna to intercalate them in the code of Justinian. These last had a practical authority.

AUTO DA FE (Port., act of faith; Span., *auto de fe*), a public day held by the inquisition for the punishment of heretics and the absolution of the innocent accused. The term is also applied to the sentence of the inquisition read to the condemned just before execution, and to the session of the court of inquisition. (See **INQUISITION**.)

AUTOLYCOUS. I. In Greek legend, a son of Mercury and Chione, father of Anticlea, and thus maternal grandfather of Ulysses, who spent part of his youth at his residence on Mt. Parnassus. He was renowned for his cunning as a robber and a liar, and possessed the power of metamorphosing both himself and the things stolen. But Sisyphus overmatched him in cunning; for Autolycus having stolen his sheep and transformed them, he identified them by marks which he had made under their feet and compelled him to restore them. II. A mathematician of Pitane in Æolia, lived about 350 B. C. His treatises on the "Motion of the Sphere" and on the "Risings and Settings of the Fixed Stars" are the oldest extant Greek works on mathematics. Three MSS. of each exist at Oxford, but no complete edition

has been published. A Latin translation appeared at Rome in 1587-'8; and a full account of them is given by Delambre in his *Histoire de l'astronomie ancienne*.

AUTOMATON (Gr. *αὐτός*, self, and *μάω*, to move), a self-moving machine, or one which contains within itself the moving power. This description would make the term applicable to watches, musical boxes, &c., but it is generally used to designate only those machines which are made to imitate the motions of men and animals. Those constructed to imitate men are sometimes called *androïdes*. Probably the earliest allusion to self-moving machines in history is to the tripods moved on living wheels, and instinct with life, which Homer describes Vulcan as having contrived. Then come the walking statues, female dancers, and wooden cow of Dædalus, whose invention appears to have been wonderfully prolific in automata. Archytas constructed his wonderful dove 400 years before Christ. In later times we have Friar Bacon's brazen head which spoke, and the eagle and iron fly of Regiomontanus, the former of which is said to have flown from the city, saluted the emperor, and returned; and the latter after flying round the room returned to its master. But the love of the marvellous has no doubt greatly improved upon the feats of the earlier inventors. The first *androïdes* which acquired any celebrity was made by Albertus Magnus, in the 13th century; it moved like a man and even spoke. Thomas Aquinas is said to have been so alarmed by it, that he broke it in pieces with his staff, to the great grief of the unfortunate inventor, who exclaimed that he had destroyed the work of 30 years. Another similar invention of Descartes, which he named his daughter Francina, shared a similar fate; the captain of a vessel on board of which it was placed, thinking the devil must be in a machine that moved so like a human being, had it thrown overboard. Charlemagne received from Haroun al-Rashid a present of a water clock, in the dial of which a door opened at each hour, and when at noon the 12 doors were all thrown open, as many knights on horseback issued out, paraded round the dial, and then returning shut themselves in again. Similar contrivances are still extant in some ancient European cities, as Nuremberg in Germany and Heusden in Holland. A very amusing automaton group was constructed by M. Comus for Louis XIV., consisting of a coach and horses, a coachman, a page, and a lady inside. The figures all performed their appropriate parts; the coach was driven up to the king and stopped, and the lady, let out by the page, presented a petition, and reëntering the carriage was driven off. Next to Dædalus, Vaucanson, who lived in Paris in the early part of the last century, appears to have been possessed of the greatest skill in this department. He exhibited in 1738 a flageolet and tambourine player, which is probably the most perfect *androïdes* ever constructed, as his duck

is no doubt the most perfect automaton. It played the flageolet with the left hand and beat the tambourine with the right, executing many pieces of music with wonderful accuracy. He also exhibited a duck in 1741, which moved, ate, drank, and even apparently digested and evacuated its food like a live duck. The figure would stretch out its neck to take food from the hand, and then would swallow it with the natural avidity of a duck, even the motion of the muscles of the neck being perceptible. It would rise up on its feet, walk, swim, dabble in the water, and quack, wonderfully imitating the natural actions of the duck. In its mechanism it was constructed in many parts—as in the wings—as nearly like those parts of the bird as possible. Vaucanson undertook, near the close of his life, to construct an automaton which would display all the mechanism of the circulation of the blood, the veins and arteries in which were to be of gum elastic; but the art of working this material was not then well understood, and there being long delay in the arrival of an anatomist sent by the king to attend to the work, Vaucanson became discouraged and gave it up. A father and son named Droz had the same remarkable talent. The former made a figure of a child, which sat at a desk, dipped its pen in the ink, and wrote in French. The latter, born in 1752, went to Paris at the age of 22 with a female figure which played different tunes on the harpsichord, following with its eyes and head the notes in the music book, and rising at the close and saluting the company. About the same time the abbé Mical made several automaton figures, some in a group, which played different instruments of music. He also exhibited at the academy of sciences two heads, which articulated syllables. Mälzel in the early part of the present century exhibited a famous automaton trumpeter at Vienna, which played many of the French and Austrian marches, and for many years afterward was exhibited by a travelling troupe in most of the cities of Europe. Still later is the automaton of the ingenious Swiss mechanic Maillardet, a female figure that performs 18 tunes on the piano, with the natural movements of the fingers and eyes and heaving of the bosom. It continues in action for an hour. With it are an automaton magician; a boy that writes and draws; a little dancing figure that moves to music from the glass case it is in; a humming bird that comes out of a box, sings, and returns; a steel spider; and a hissing serpent. Kempelen's automaton chess-player was no true automaton, but constructed to contain a person, by whose intelligence the movements were controlled and the game played. The doors of the machine were opened apparently to expose the whole interior; but they were never all opened at the same time. A person could thus move from one part of the interior to another, keeping himself concealed. Such a one, known to be a skilful chess-player, travelled with the exhibition, and was never seen

during the continuance of the game. A very ingenious automaton clarinet player was made by Van Oeckelen in Holland, and exhibited in New York about 1860. It performed operatic and classical selections, with accompaniment of other instruments played by living performers; it took the instrument from its mouth, moved its head and eyes, and bowed before the audience. It was wound up like a clock, and a drum, like that of a hand organ, was placed in its chest, a different one for every piece of music. The most perfect and latest is perhaps the speaking automaton of Faberman of Vienna, exhibited in New York in 1872. It is the result of a thorough physiological study of the human organs of speech, and their close imitation by the materials and mechanical arts of the present day. As these contrivances have no practical utility, serving only to display the ingenuity of the maker, their construction in the United States is confined to children's toys.

AUTOPLASTY (Gr. *αὐτός*, self, and *πλάσσειν*, to shape or form), a surgical operation by which the nose or other superficial portion of the body, being destroyed by accident or by disease, may be renewed or replaced by a portion of skin taken from another part of the same body. This art is said to have been practised in India from time immemorial. It was a custom to punish crime by cutting off the nose, or the lips, or the ears of the criminal; and for a time the parts were immediately replaced and found to grow again. To prevent this the excised parts were destroyed by fire; but the fact of the natural part adhering after it had been excised, and healing as a common wound, suggested the idea that a portion of skin removed from any other part of the body, and applied immediately to the mutilated part, might heal and become a natural substitute for the part removed. When the nose was cut off by the executioner, the surgeon cut a triangular portion of skin from the forehead, leaving it still attached by a small pedicle over the root of the nose, and, twisting it round, reversed it over the nasal region to supply the place of the nose which had been cut off. The skin adhered and the deformity was lessened, but a scar remained upon the forehead where the skin had been removed. This method was adopted in other countries, where the nose, the eyelids, or any portion of the face had been injured by accident or by disease. Celsus speaks of nasal and labial autoplasty. In the 15th century this art was practised in Calabria by the Branca family of surgeons, who introduced the practice of taking a portion of skin from the arm to replace a deformity in the face, instead of turning over a piece of skin from the immediate neighborhood of the part repaired, leaving a scar close by almost as bad as the original deformity. In the following century Lanfranc, an Italian surgeon, practised the art of nasal autoplasty with success in Paris; and the celebrated Gasparo Tagliacozzi (Taliacotius) practised the same art in Italy, and wrote his work on the art of autoplas-

tic surgery, which is still in good repute. The last-named surgeon improved the operation to such an extent, and did so much to bring it permanently into recognition, that the restoration of the nose or other lost parts, when performed according to his method, received his name, and became known as the "Taliacotian operation." In the beginning of the present century this art was revived by the celebrated English surgeon Carpeu, and has been much improved by Gräfe, Dzondi, Delpech, Cooper, Dupuytren, Roux, Lisfranc, Blandin, Velpeau, Lallemand, Dieffenbach, and other celebrated surgeons of the present time. New methods have been introduced, and almost any superficial portion of the body may be now repaired by autoplastic surgery. Three methods are adopted, the Indian, the Italian, and the French, and one or the other is preferred according to the parts involved. The Indian method, already described, consists in turning over a contiguous portion of skin to repair the deformity; the Italian method consists in taking a portion of skin from the arm, or from a distant portion of the body; the French method consists in loosening the skin on either side of the injury, so as to detach it from the parts beneath, drawing it together until it covers the lost part, and then uniting the borders, by suture pins and ligatures, until the parts adhere and grow together. This is far the best wherever it is practicable. The resources of this art are now very considerable, but skill is required to operate well, and judgment to decide whether it will be practically useful; for, where the general health of the patient is unfavorable, the operation may be unadvisable.—Different names are given to the operation, according to the parts repaired by this method: it is termed "blepharoplasty" when applied to the eyelids; "otoplasty" when applied to the ears; "rhinoplasty" when applied to the nose; "cheiloplasty" in reference to the lips; "palatoplasty" for the roof of the mouth; and "bronchoplasty" for the trachea.

AUTUMN (Lat. *autumnus*), the third season of the year. In the northern temperate zone it begins when the sun in its apparent descent to the southern hemisphere crosses the equatorial line, and ends at the period of the sun's greatest southern declination, or when he enters Capricorn. This astronomical autumn begins about Sept. 23, and lasts till about Dec. 21. But in popular language in the United States autumn comprises the months of September, October, and November; in England, August, September, and October. In the southern hemisphere, the autumn takes place at the time of our spring.

AUTUN (anc. *Bibracte*, afterward *Augustodunum*), a town of France, in Burgundy, department of Saône-et-Loire, on the Arroux, 50 m. N. N. W. of Mâcon; pop. in 1866, 12,889. It lies at the foot of a range of well wooded hills; the surrounding country is rich in vineyards and corn fields. The town contains many antiqui-

ties. Massive and curious fragments of the ancient Roman walls still stand; also the so-called temple of Janus, of imposing proportions and solidity. Besides these there are two curious Roman gates, the remains of an amphitheatre, and just without the gate a pyramidal mass of architecture, built probably for sepulchral purposes, but in whose honor antiquaries are in doubt. The town contains several fine specimens of church architecture, among them the cathedral of St. Lazare, Romanesque in style, and the chapelle St. Nazarre, interesting for its richly painted glass. Near Autun are the valuable coal basins of Épinac and Creuzot. The episcopal see of this city was once held by Talleyrand. The town figures in the history of Gaul as the capital of the *Ædui*. Under the Romans and the Franks it was often exposed to the ravages of war. Its vicinity witnessed considerable fighting in the war of 1870-'71, chiefly between the troops of Garibaldi and those of Gen. Werder. An attack on the town by the latter was gallantly repulsed Nov. 30, 1870.

AUVERGNE, an old province of France, now forming the departments of Cantal, Puy-de-Dôme, and part of Haute-Loire. It is divided into two parts, very different in their climate and productions. Upper Auvergne, which includes chiefly the departments of Cantal and Puy-de-Dôme, is a mountainous, wild, and picturesque cattle-raising district. The mountains which intersect it are a branch of the Cévennes, and lie in confused groups, sending up several summits to the height of 6,000 feet, some of which are extinct volcanoes. Mont Dore, the highest of them, is an almost isolated cone, and has its sides covered with scoriae. Lower Auvergne extends along both banks of the Allier, and presents a continual succession of towns and villages, and of the most fertile hills and valleys of France, which produce abundantly the vine, grains, and fruits. The province takes its name from the ancient *Arverni*, one of the most powerful tribes of Gaul in Cæsar's time, of whom the present Auvergnats are supposed to be the almost unmixed descendants. Though their province has contributed a number of distinguished names to the history of their country, the Auvergnats are often spoken of as the *Boeotians* of France.

AUX CAYES, or *Les Cayes*, a seaport town on the S. W. coast of Hayti, capital of a department, situated on the bay of Cayes, in lat. 18° 11' N., lon. 73° 50' W., 92 m. W. S. W. of Port-au-Prince; pop. about 8,000, chiefly negroes and mulattoes. The exports embrace sugar, cotton, and coffee, and the trade is principally in the hands of British merchants. In the vicinity are many rum distilleries. A considerable smuggling trade is carried on with Jamaica. The hurricane of Aug. 12, 1831, destroyed part of the town, killing several thousand persons. The civil wars since 1868 have also proved injurious to Aux Cayes. The climate is unwholesome.

AUXERRE, a city of France, capital of the department of Yonne, on the left bank of the river Yonne, 90 m. S. E. of Paris; pop. in 1866, 15,497. Its wines are much esteemed. Its manufactures are calicoes, cloths, serges, druggets, earthenware, violin strings, &c. It has a college, a secondary ecclesiastical school, a museum of antiquities, a public library of about 25,000 volumes, a cathedral with a fine flamboyant Gothic façade, and the quaint church of St. Germain, with curious crypts, in which lie buried the mediæval counts of Auxerre and its vicinity (*Auxerrois*).

AUXONNE, a fortified town of France, in the department of Côte d'Or, on the left bank of the Saône, 17 m. S. E. of Dijon; pop. in 1866, 5,911. It has an arsenal and barracks, with manufactures of woollen cloth and nails.

AUZOUT, *Adrien*, a French mathematician and astronomer, born in Rouen, died in Rome about 1698. In conjunction with Picard, he applied the telescope to the mural quadrant. He invented and applied to the telescope a movable wire micrometer, on which he published a treatise in 1667. By the aid of this instrument he observed and measured the diurnal variation of the moon's diameter, first explained by Kepler. Auszout was an efficient optician and maker of telescopes. His observation and calculations of the comet of 1664 suggested to Louis XIV. the first idea of founding an observatory at Paris, and he was one of the original members of the academy of sciences, founded in 1666.

AUZOUX, *Théodore Louis*, a French physician and anatomist, born at St. Aubin d'Ecroville, department of the Eure, about 1797. He is celebrated as the inventor of a new method of making permanent models of anatomical preparations in papier maché, an art known under the French name of *anatomie clastique*. The advantages of this method are: 1st, that the material used is light, not easily broken, and unaffected by the atmosphere at all ordinary temperatures; 2d, that minute parts can be represented in enlarged dimensions, and colored to imitate nature; and 3d, that the pieces representing the different parts of an organ and the different organs of the body can be separated from each other and put together at will. Dr. Auzoux completed his invention by 1825, and established a manufactory at St. Aubin for the production of anatomical models. He obtained a gold medal for his anatomical preparations at the French exposition of 1834, honorable mention in 1839 and 1844, and a second gold medal in 1849. He received the cross of the legion of honor in 1834. At one time he gave annual courses of lectures upon anatomy and physiology, illustrated by the aid of his own preparations. His published works are: *Considérations générales sur l'anatomie; Mémoire sur le choléra-morbus*, &c. (Paris, 1832); *Leçons élémentaires d'anatomie et de physiologie* (1839; 8d ed., 1858); *Des tares molles et osseuses dans le cheval* (1853);

Insuffisance des chevaux forts et légers, du cheval de guerre et de luze, &c. (1860).

AVA (Burmese, *Ang-ua*, a fish pond, so called because the original town was built around one), formerly the capital of the Burman empire, styled in the official documents of the country *Ratanapura*, the city of gems, situated on an island formed by the Irrawaddy river on the N., the Myit-nge on the E., and the Myit-tha, an offset of the Myit-nge, on the S., and on the S. E. angle by a canal, through which the waters of the Myit-nge flow, dug to defend that face of the city; lat. 21° 58' N., lon. 95° 58' E. The population was formerly from 30,000 to 50,000, but is now much less. Ava is divided into upper and lower, or inner and outer towns. Exclusive of suburbs, the whole place is about 5½ m. in circumference, and is enclosed with a brick wall 15½ ft. high and 10 ft. thick; an embankment of earth supports this wall on the inner side, and there is a small ditch on the outside. The inner town includes the palaces, royal pagodas, and other public buildings. The houses of the outer town are for the most part wretched huts of bamboos and mats thatched with grass. The residences of the chiefs and wealthy men are generally constructed of planks, and tiled; but the town is now decayed and desolate.—Ava was first made the capital about 1364; and since then the Burman kings have shifted the capital eight or nine times. In 1839 every substantial edifice in Ava was destroyed by an earthquake; in consequence of which Monchobo, the birthplace of Alompra, and once the seat of the court, again became temporarily the capital of the Burman empire. Afterward both Amara-pura and Ava were honored by the preference of the kings, until within a few years, when the capital was fixed at Mandalay.

AVA, Kingdom of. See BURMAH.

AVAILANCHE (Fr. *avalanche* or *avalange*), a mass of snow precipitated from mountain sides to the lower levels. Avalanches are common in the Alps and Apennines, and several different forms of them are described. The drift avalanche is the light, dry snow swept from the mountains by strong winds, and accumulated in the valleys, sometimes to such depths as to bury the villages it falls upon. More destructive is that formed by the damp, cohering snow, which, beginning in a small rolling body, gathers with every turn increased proportions and velocity, and taking up in its progress loose rocks and earth, or the shattered limbs of trees, sweeps off not only houses and villages, but the very lands on which they stand. It is said that in the year 1500 100 men were buried by such an avalanche in the Great St. Bernard; and in 1624, in Italian Switzerland, 300 soldiers were thus engulfed, many of whom, however, were afterward dug out alive. The villages in the high valleys of the Rhône have been particularly exposed to these disasters. In 1827 the village of Briel in Valais was almost entirely covered with an avalanche.

The rolling avalanches sometimes change in their descent to sliding masses, and these take in their progress every movable body, down to the solid rock of the mountains. Hills of gravel and loose rocks, covered with forests and dwellings, are thus carried down to lower levels, and in cases of vineyards thus removed, intricate questions of proprietorship have arisen. Ice avalanches are produced by the breaking of masses of ice from moving glaciers. (See GLACIER.)

AVALLON, a town of France, in the department of Yonne, on the Cousin, 26 m. S. E. of Auxerre; pop. in 1866, 6,070. It is surrounded by a country renowned for fertility and beauty. It has considerable trade in wine, leather, and horns, and manufactures of wool.

AVALOS, Ferdinando Francesco d', marquis of Pescara, an Italian general of Charles V., born in Naples in 1490, died in Milan, Nov. 4, 1525. His ancestors came from Spain to Naples in the middle of the 15th century. In early childhood he was affianced to Vittoria Colonna, who was then only four years old, and he married her while he was still a mere lad. He distinguished himself at the battle of Ravenna, where he was wounded and captured. While in prison he dedicated to his wife a poem entitled "Dialogue of Love." Ransomed through the influence of a favorite of Louis XII., he distinguished himself at the battle of Vicenza in 1513; at Milan, which city he took from the French in 1521; and at Como, which he sacked contrary to his promise. In 1522 he took an active part against the French at Pavia, La Bicocca, and Lodi, and brought about the capitulation of Pizzighettone and Cremona, and the capture and sacking of Genoa. The decisive victory over Francis I. at Pavia (Feb. 24, 1525) was chiefly ascribed to the valor of Avalos, who was wounded, and received the congratulations of friends and foes. He was made generalissimo, but became unpopular because, after having joined the league of the duke of Milan for the expulsion of the Spaniards and Germans from Italy, he subsequently betrayed the scheme to Charles V. The crown of Naples, however, which was offered to him by the Italian princes in reward of his treachery, he refused by the advice of his wife.

AVARIS, a stronghold of the Hyksos in Lower Egypt. See HYKSOI.

AVARS, a tribe of Turanian origin, who first appear in European history about the middle of the 6th century, when the bulk of them left their abodes between the Caspian and the Don, penetrated to the Danube, and settled in Dacia. They served in the army of Justinian, allied themselves with the Longobards against the Gepids, and finally occupied Pannonia and other parts of modern Hungary, and established their dominion over the Slavs north and south of the Danube. Their sovereigns were called khans. The mightiest among them was Baian (570–630), whose dominions extended from the

Elbe to the Black sea, and to whom the Byzantine emperors paid tribute. The Avars seized Dalmatia, and made inroads into Italy and into the heart of Germany. In 640 the Slavs revolted, and the dominion of the Avars over them came to an end; but they still maintained themselves in Pannonia. They allied themselves with Thasilo, duke of Bavaria, against Charlemagne; but that monarch finally broke their power (791 and 796). One of the Avar khans, Tudun, joined Charlemagne, and was baptized at Aix-la-Chapelle, but subsequently abandoned the emperor and fought against him until he was taken prisoner and beheaded. About 827 the Avars disappear wholly from history. They have been confounded with their forerunners the Huns, and with their successors the Magyars. The modern Avars of Lachistan in the Caucasus have also been erroneously considered their kindred. Remains of the long-walled camps of the medieval Avars are still to be seen near the Danube in Hungary.

AVATAR, a Sanskrit word, signifying "a descending," usually applied in a religious sense, and in reference to the incarnation of the Hindoo deities. Whence the doctrine of the avatar is derived is a point that has received no satisfactory solution. The most important avatars of Vishnu, one of the persons of the Hindoo trinity, are: 1, that of the fish, in which he preserved Manu, the first man, during a deluge; 2, the tortoise, when Vishnu supported the earth while the gods and the Asuras extracted the immortal drink (*amrita*) from the sea; 3, the boar, in which he slew the chief of the Asuras, the opponents of the gods; 4, the lion-man, in which he killed the deceased Asura chief's brother; 5, the dwarf, in which form he played a trick on King Bali, of whom he asked as much ground as he could measure in three strides, and the king having granted the request, the god, at once manifesting himself, strode over earth, air, and heaven; 6, the man Parasurama, the son of Jamadagni and Renuka, when he rescued the Brahmans from the tyranny of the Kshatriyas; 7, Rama, the son of King Dasaratha, when he destroyed various demons by exploits described in the Sanskrit epic of *Ramayana*; 8, Krishna, the greatest of the avatars, when he assisted the family of the Pandavas against the Keroos, and conquered the wicked of the earth—the subject of the *Mahabharata*; 9, Buddha, in which he persuaded the Asuras, the ancient enemies of the gods, to abandon their faith in the Vedas; 10, Kalki, the name of the avatar of Vishnu when he shall come again to restore peace and parity on earth.

AVATCHA, Mount (Russ. *Avatchinskaya Gora*), a volcano in Kamtschatka, near the S. E. coast, in lat. 53° 15' N. and lon. 158° 50' E., rising to an elevation of nearly 9,000 ft. It has a crater at its summit several hundred yards in circumference, and another at an elevation of 5,000 ft. Amor

recorded eruptions are those of 1837 and 1855, when it discharged with great violence vast quantities of lava, stones, and water. S. of the mountain is the bay of Avatcha, on which lies the town of Petropavlovsk.

AVESBURY, a village in Wiltshire, England, 5 m. W. of Marlborough, notable as the site of the remains of the largest Druidical temple in Europe. In an open plain, free from trees, 650 blocks of stone, varying from 5 to 20 ft. above the ground, and 8 to 12 in breadth and thickness, were brought together. One hundred of these were set on end around an area 1,400 ft. in diameter; and these were enclosed by a ditch and mound with two breaks for openings. The area within the bank is over 28 acres. From the arrangements it has been conjectured that there were within this great circle two smaller circular temples, besides two avenues of great stones leading to the entrances from a distance of more than a mile. The remains have been almost entirely destroyed of late years, all that was capable of removal having been gradually carried away.

AVEIRO, a seaport town of Portugal, in the province of Beira, S. of the mouth of the Vouga, on a bay called the Barra de Aveiro, 37 m. S. of Oporto; pop. in 1898, 6,557. It is an episcopal see, and has an extensive trade in sea salt. In the 16th century it was a commercial place of great importance.

AVELLANEDA, Alonso Fernandez de, the real or assumed name of the author of the spurious *Segunda parte del ingenioso Hidalgo D. Quixote* (Tarragona, 1614; French translation by Le Sage, Paris, 1704-'6). Though Avellaneda seems to have been known in an obscure manner to his contemporaries and to Cervantes himself, the authorship of the book, which appeared under his name many years in advance of the real second part of "Don Quixote," has been assigned, but without conclusive authority, to Luis de Alcala, the king's confessor, and also to Juan Blanco de Paz, a Dominican friar. Cervantes refrained from noticing the publication until the 59th chapter of his own second part. Mr. Ticknor, in his "History of Spanish Literature," says of Avellaneda's book that, "if not without merit in some respects, it is generally low and dull, and would now be forgotten if it were not connected with the fame of Don Quixote."

AVELLANEDA, Gertrudis Gomez de, a Spanish poetess and novelist, born at Puerto Principe, Cuba, in 1816, died in Seville in June, 1864. Her father was a Spanish naval officer, after whose death she went to Spain, where her first drama, *Leoncia*, was favorably received at Madrid in 1840. In 1845 she was crowned with laurel in the presence of the court and received a prize for a poem exalting the clemency of the queen. In 1846 she married Pedro Sabador, a young Spanish politician, who died in the same year. She afterward led a secluded life at Madrid and Seville. Her 2 vols. of lyrical *Id. od.*, Mexico, 1852), her 16 dramas,

and her 8 vols. of prose writings secured for her a high reputation.

AVELLINO, a fortified town of S. Italy, capital of the province of Principato Ulteriore, 28 m. E. of Naples; pop. about 15,000. It has a cathedral, several fine public buildings, and a public granary. It is celebrated for its filberts, which are largely produced in the vicinity, and are hence called in Latin *nuces Avellanae*, and in French *avelines*. There is also a large trade in chestnuts and grain, and manufactures of hats and cloth. At the village of Atripalda, 2 m. distant, are the remains of the ancient town of Abellinum, which being destroyed in the wars between the Greeks and Lombards, the inhabitants settled on the present site. The town has suffered much from earthquakes.

AVE MARIA, a short prayer much used in the Roman and Greek Catholic churches. The first clause is the salutation of St. Elizabeth to the Blessed Virgin, with the names "Maria" and "Jesus" added. The second clause is an acclamation employed by the fathers of the council of Ephesus and the people generally, to express their joy at the decision of the question raised by Nestorius whether Mary is truly the mother of God. It is usually joined with the Pater Noster.

AVENBRUGGER, Leopold. See **AUENBRUGGER**.

AVENTINUS, Mons. See **ROME**.

AVENTURINE, a variety of quartz, and also one of feldspar. The peculiarity in each, for which the name is given, is the play of reflected or refracted light from numerous points in the mass of the stone—the reflections being bright and sparkling, and of different colors, while the ground may be translucent with little brilliancy, and of a dull color. The effect is probably produced by the crystalline faces in the structure of the stone refracting the light differently. There are, however, some varieties, called also aventurine, in which the play of colors results from the presence of numerous little scales of mica, or other foreign ingredients, each of which reflects the light, and all together produce a similar effect to that of the true varieties of aventurine. An artificial glass of this name is manufactured at Venice, which is well adapted to ornamental purposes, being even more beautiful than the natural minerals. Within the glass are substances apparently vitreous, of great brilliancy, of the color of copper, and in very small crystals of the form of tetrahedrons. It is said to have been discovered by a workman in Murano through accident (*aventura*) letting fall brass filings into molten glass.

AVENZOAR (properly **IBN ZOHR**), **Abu Merwan**, an Arabian physician, born at Peñaflor in Spain about 1072, died in 1162. He began the study of medicine at the age of 10 under the direction of his father, who imposed upon him an oath never to make use of poisons. He was the preceptor of Averroes. Avanzoar tried to bring medicine within the range of experimental science. Several of his works, translated

into Latin, have been published. His *Rectificatio Medicationis et Regiminis* was published at Venice in 1490 and 1496, with the remarks of Averroes in 1514, and at Lyons in 1851.

AVERAGE. 1. **General** (sometimes called **gross** or **extraordinary**), in mercantile law, the contribution made by all the parties concerned in a sea adventure to make good an expense or loss sustained by one or more of them for the benefit of all. The fundamental principle of the law of general average, as expressed in Justinian's Pandects, and adopted by all commercial nations, though with considerable diversity of practice, comes from the Rhodian law, the first known system of marine law, which thus stated the rule: "If goods are thrown overboard in order to lighten a ship, the loss incurred for the sake of all shall be made good by the contribution of all." It would be difficult to set forth the essentials of a case for general average more clearly than they have been stated in the supreme court of the United States (*Barnard v. Adams*, 10 How. 270), Mr. Justice Grier delivering the opinion: "In order to constitute a case for general average, three things must concur: 1. A common danger, or a danger in which ship, cargo, and crew all participate—a danger imminent and apparently inevitable, except by voluntarily incurring the loss of a portion of the whole to save the remainder. 2. There must be a voluntary jettison, *jactus*, or casting away of some portion of the joint concern for the purpose of avoiding this imminent peril; or, in other words, a transfer of the peril from the whole to a particular portion of the whole. 3. This attempt to avoid a common peril must be successful. The right to contribution is not made to depend on any real or presumed intention to destroy the thing cast away, but on the fact that it has been selected to suffer the peril in place of the whole that the remainder may be saved." Not only the value of the property destroyed, but what follows as a necessary consequence of its destruction, as injuries to other goods, expenses of refitting, and the wages and provisions of the crew in the port of relief, are subjects of contribution. So is also ransom paid to a pirate, by both the common and civil law (the rule of which on this point has been repealed in England), and in general whatever necessary and voluntary loss or expense is incurred by a part for the good of all. Goods finally saved must contribute for loss sustained in procuring temporary safety. By the French ordinance, goods stowed upon deck are expressly excluded from the benefit but not from the burden of general average, since they are supposed to hamper the vessel and increase the danger; and such is the general tenor of both the English and American law. In the courts of all three countries, however, an established usage to carry upon deck, as with small coasting vessels, is allowed to take a case out of the operation of the rule. Both the continental and the American law is somewhat

more liberal than the English as regards the subjects of general average, but the difference consists not in the nature but in the application of principles. The victuals and ammunition of a ship do not contribute in a case of general average, nor whatever is necessary to the persons of those on board, as wearing apparel, &c., nor the passengers for their own safety, nor the crew for their wages, lest apprehension of personal loss should deter them from personal sacrifice. The rule of the civil law that "those things alone which pay freight contribute" is, with slight limitations, the general law on this point. The rate of contribution is in proportion to the safety obtained, according to value, not weight. The rules upon which this adjustment is made differ in different countries, and are not well settled anywhere. It is a matter of such nice calculation, that in most commercial ports the computation and adjustment of general average constitute a special branch of business, attended to by a special class of men. By the civil law, the master of the vessel was required to see to this; and the provisions of the French ordinance are somewhat similar, but are practically disused, the work being performed by *dépêcheurs*, as they are called. **II. Particular**, an almost obsolete barbarous expression, used to signify a partial loss, which must be borne by the immediate loser alone. **III. Petty Averages** are sundry small charges borne in common by the owners of a ship and cargo, like pilotage, towage, anchorage, light money, quarantine, &c.

AVERNO (anc. *Avernus*), a lake in Italy, about 8 m. W. of Naples, and near the ruins of ancient Cumæ. It lies in the crater of an extinct volcano, and, though less than 2 m. in circumference, is of great depth. It has no natural outlet, but an artificial passage for its waters into the gulf of Baiæ was made by Agrippa, who also connected it with the Lucrine lake. This latter passage was closed by a volcanic convulsion which in 1538 cast up a hill of considerable height in the place of the latter lake. No attempt has been made to reopen the communication thus obstructed; and as the subterranean tunnel which connected Averno directly with the sea has also been blocked up, the lake is again without an outlet. In ancient times, Avernus, with the wild and gloomy scenery about it, the pestilent vapors rising from its volcanic shores, and the prevailing belief in its unfathomable depth, was reputed the entrance to Hades, and was made sacred to Proserpine. By this path Ulysses, according to the legend, visited the ghosts of the dead, and here was also a famous oracle. The lake retains few of its ancient characteristics; the dense woods which anciently covered its banks were cut down before the time of Strabo, and the volcanic phenomena appear to have entirely ceased. The ruins of a Roman edifice, probably a bath, are on the S. E. border of the lake.

AVERROES, or *Averrhoës* (a corruption of Ibn Rosn), an Arabian philosopher, born in Cor-

dova about 1120, died in Morocco, Dec. 12, 1198. Educated by eminent masters, he became, like his father, distinguished for his varied knowledge, and succeeded him in the office of mufti or chief judge in Andalusia, and subsequently held the same position in Morocco. He stood high in the esteem of successive rulers, especially of Al-Mansour; but the latter, yielding to those who could not reconcile the philosophy of Averroes with his professed devotion to the Koran, and perhaps also impelled by personal animosity, banished him for several years, but finally restored him to his office. He wrote on astronomy, particularly on the spots of the sun, and on many other scientific subjects; but he is chiefly celebrated as a commentator upon Aristotle and Plato. He grasped the ideas of the Greek philosophers, though he had no knowledge of the Greek language. The first complete edition of his works was published in Latin at Venice in 11 vols. (1552-'60), the commentaries filling 8 volumes, and 8 volumes containing his refutation of Algazzali's work against Greek philosophy, his great medical work, *Kulliyat* or improperly *Colliget* (of which several editions have been published), and miscellaneous treatises. As a philosopher he tended toward pantheism and materialism. His professed disciples were called Averroists. Leo X. issued a bull against his doctrines after they had been denounced by the university of Paris. Renan, in his *Averrhoës et l'Averrhoïsme* (Paris, 1852), gives a full notice of his life and works, and characterizes him as the chief representative in the middle ages of the Peripatetic philosophy and of freedom of thought, and as exempt from all purely dogmatic and religious bias. Among other recent works relating to his doctrines is Müller's *Philosophie und Theologie von Averrhoës* (Munich, 1859).

AVERSA, a town of Italy, in the province of Terra di Lavoro, situated in a remarkably fertile region, 8 m. N. of Naples; pop. in 1872, 21,176. It contains a cathedral and many churches and convents, a foundling hospital, and a lunatic asylum founded by Murat, which was among the first to attempt curing the insane by occupation and recreation. The sparkling white Asprino wine of Aversa is often sold as champagne, and its sweetmeats, especially almond cakes, are great delicacies. Aversa was settled by the Normans, and granted in 1029 to Rainulf, one of their leaders, who received from the emperor Conrad II. the title of count of Aversa. In 1030 the inhabitants of the ancient city of Atella, the site of which is still visible in the vicinity, were removed hither. In 1061 the county was annexed to the principality of Capua, then a papal fief.

AVESNES, a town of France, capital of an arrondissement in the department of Le Nord, on the Helpe, 50 m. S. E. of Lille; pop. in 1866, 3,787. It is one of the fortresses which protect France on the east, built under the reign of Louis XIV. according to the system of Vauban. It was bombarded immedi-

ately after the battle of Waterloo, almost destroyed by the explosion of a magazine, and for some time occupied by the allies.

AVEYRON, a S. department of France, forming a part of the old province of Guienne, bounded by Cantal, Lozère, Gard, Hérault, Tarn, Tarn-et-Garonne, and Lot; area, 3,375 sq. m.; pop. in 1872, 402,474. It is named from an affluent of the Tarn, which rises in the department near its E. border, flows W. as far as Villefranche, and then S. to the confines of the department of Tarn. The Lot flows on the N. W. border. Aveyron is one of the most mountainous districts of France. It has mines of copper, lead, silver, zinc, iron, and coal; those of coal are among the most valuable in the country. Cattle are raised in great numbers. The famous Roquefort cheese is largely exported. The department is divided into the arrondissements of Rodez, Villefranche, Espalion, Millaud, and Saint-Affrique. Capital, Rodez.

AVEZAC. See D'AVEZAC.

AVICEBRON, or *Avicobrol*. See SOLOMON BEN GABRIEL.

AVICENNA (a corruption of *IBN SINA*), an Arabian physician and philosopher, born in a village of Bokhara in 980, died in 1036 or 1037. He was educated at Bokhara, where he devoted himself to study with such extraordinary zeal that before he reached manhood he was already famous as a physician, and at 21 he had written an encyclopædia of science to which he gave the name of "Book of the Sum Total." He afterward wrote a series of commentaries on this work. He delivered public lectures on logic and astronomy in the house of a rich patron of learning at Jorjan in Khorasan, and afterward became vizier to the emir of Hamadan, at whose court he taught philosophy and medicine, closing his lectures every evening with feasting and dancing. Involved after the death of this prince in a secret correspondence with the ruler of Ispahan, he was thrown into prison, but made his escape to that city, and there spent the latter part of his life in prosperity. Before his death he reformed the excesses of his conduct, freed his slaves, and gave his fortune to the poor. His medical writings, which number over 60 distinct works, were long held in the highest esteem, and the most important of them, the *Kanun* ("Canon"), was for many centuries the standard authority even in Europe. It gave

an excellent synopsis of the views of the ancient Greek physicians. It was published in Latin as early as 1473 (Padua), in Hebrew in 1492 (fol., Naples), and in the original Arabic in 1593 (fol., Rome). There were about 30 Latin editions of the "Canon" during the 15th and 16th centuries. Avicenna's principal philosophical work, the *Ash-Shefa*, or "Remedy," has never been printed.

AVIGLIANO, a town of S. Italy, in the province of Basilicata, 11 m. N. W. of Potenza; pop. about 10,000. It has a handsome collegiate church, a royal college, and several convents. A portion of the town was destroyed by a land slide in 1824.

AVIGNON (anc. *Avenio*), a town of S. E. France, in Provence, department of Vaucluse, 865 m. S. S. E. of Paris, situated on the Rhône, which is here crossed by an elegant suspension bridge built in 1844; pop. in 1866, 86,407. It is an archiepiscopal see, and has a lyceum, a seminary, a public library, museums of antiquities, paintings, and natural history, a botanical garden, an agricultural society, and an association called the academy of Vaucluse. Its industry is active, especially in the cultivation of madder, in the manufacture of silks,

Avignon, France.

colored cloths, and taffetas, and in copper, lead, and iron works. It carries on an extensive trade in the various productions of Provence, particularly in grains and highly esteemed red wines. The town is generally well built, in the form of an almost regular oval, and its walls, rather beautiful than strong, are flanked with towers, adorned with battlements, and surrounded by handsome boulevards. The streets are narrow, but there are magnificent wharfs along the Rhône and numerous ancient and remarkable edifices. Among the latter is the palace of the popes, a sombre Gothic structure of the 12th century, now transformed into a prison and barracks. This city was the capital of the Gallic tribe of the Cavares prior to

the conquest of Gaul by Julius Cæsar. It remained under Roman domination till the 5th century, when the Burgundians took possession of it. From the Burgundians it was taken by the Goths, who in turn yielded it to the Franks. The Saracens captured it twice, shortly before and after the battle of Poitiers (732), and both times were forced to abandon it by Charles Martel. It was a Carlovingian city for about a century and a half; then several times exchanged its masters, became a republic under the protection of the German empire, adhered to the Albigensian heresy, and was captured by Louis VIII. in 1226, who made it the common inheritance of two sons, through one of whom, Charles of Anjou, it became attached to the crown of Naples. In 1309 Pope Clement V., at the request of Philip the Fair, established himself at Avignon. The city and its dependencies were purchased by the supreme pontiff from Joanna of Naples, and all the popes from Clement V. to Gregory XI. (1309-'77) made their residence here. The last-named pope restored the papal see to Rome, but during the great schism, from 1378 to 1418, several of the rival popes resided in Avignon. The 14th century was thus the period of the town's greatest splendor. It then numbered about 100,000 inhabitants. Petrarch was among its many distinguished residents. After the close of the schism Avignon, which with its environs then formed the comtat de Venaissin, was governed by the legates of the pope, till in 1791 France succeeded, after various attempts, in reclaiming it. Twenty-one councils of the church were held in Avignon, from 1050 to 1725.

ÁVILA. I. A province of Spain, forming the S. W. part of Old Castile, and bordering on New Castile and Estremadura; area, 2,981 sq. m.; pop. in 1867, 176,769. The northern portion of the province is generally level, of moderate fertility, and the inhabitants are engaged in agriculture. The southern part is intersected by numerous rocky mountain ranges, with verdant valleys between. Here the raising of cattle is the most important branch of industry. The Alberche and the Adaja, respectively affluents of the Tagus and the Douro, are the principal rivers. Two centuries ago the province was wealthy and populous, but it has gradually decayed, in consequence of the burdensome manorial and feudal privileges, and the laws of entail and mortmain. Merino wool is the chief article of production. Besides the capital, it contains no town of importance. II. The capital of the preceding province, an episcopal city, situated on the Adaja, 58 m. W. N. W. of Madrid; pop. about 7,000. It had formerly a flourishing university and extensive woollen manufactures, but its ancient prosperity has departed. The city is encompassed by a wall, still in good repair, with towers of great strength. It has a fine old cathedral and a Dominican convent, both of which contain some beautiful monuments. The church of San Vicente, without

the walls, said to have been erected in 818, is an interesting object.

AVLONA (anc. *Aulon*), a fortified town of Turkey, the best seaport of Albania, in the pashalic of Janina, on the gulf of Avlona; pop. about 8,000. The Christian part of its inhabitants are chiefly employed in commerce. The Turks manufacture woollen fabrics and arms.

AVOCET, or *Avocet* (*recurvirostra*), a bird of the order of the *grallatores*. There is but one European and one American species, which are very closely connected, and would at first sight, by an unpractised eye, be pronounced identical. The bill is long, slender, and reflected upward at the extremity. The bird is webfooted, but does not swim easily or willingly, though it wades quite up to the breast, for which it is admirably qualified by its long legs, which are naked up to the head of the thigh. The palmed webs of its feet enable it to stand and run, without sinking, over the soft mud of the seashore. It feeds on aquatic animals, such as the smaller conchifers and mollusks, and on the spawn of fishes. The American avocet, *recurvirostra Americana*, is thus described by Giraud in his "Birds of Long Island": Local

Avocet.

space white; neck and fore part of the breast reddish buff; lower parts, back and tail white; wings black, with a broad band of white formed by the tips of the secondary coverts. Lower portion of the tibia naked. Legs blue. Length 18 inches; wing, 9. A few breed at Egg Harbor, where they are known as the "blue-stocking." It builds its nest of seawrack and dried sedge among tufts of long grass by the edge of some salt pool. It is common in all parts of the United States, especially in the fur countries.

AVOIRDUPOIS (Fr. *avoir du poids*, to have weight; or, possibly, as it was formerly spelled *averdupois*, from the old Fr. verb *averer*, to verify), a standard of weight, to which articles of merchandise sold by weight are referred, except the precious metals, gems, and medicines. The pound avoirdupois contains 7,000 grains; the pound troy contains 5,760. The ounces do not retain the same proportions, there being 16 to the pound avoirdupois, and 12 to the pound troy. The ounce avoirdupois is supposed to be the same as the Roman *uncia*, which, according to Dr. Arbuthnot, contained the same number of grains, viz., 487½; but it

is very unlikely that these small weights have been preserved uniformly the same for so long a period. The old term *avoirdupois* is first met with in 1582, in some orders of Henry VIII.; and in 1588 a pound of this weight was deposited, by order of Queen Elizabeth, in the exchequer, as a standard. This, when examined in 1758 by the committee appointed by the government, was found to be $1\frac{1}{2}$ grain deficient in weight; and the troy weight was thereafter made the standard. The standard grain, prescribed by act of parliament in the reign of George IV., is such that "a cubic inch of distilled water weighed in air by brass weights, at the temperature of 62° Fahrenheit's thermometer, the barometer being at 30 inches, is equal to 252.458 grains."

AVOLA (anc. *Abolla*), a town of Sicily, on the E. coast, 18 m. S. W. of Syracuse; pop. about 8,000. It was rebuilt after its destruction by the earthquake of 1693. The exquisite honey, so renowned in antiquity as honey of Hybla, is still produced in its vicinity. Avola has a tunny fishery and a refinery for home-grown sugar.

AVON, the name of several English rivers, the most important of which, the Upper Avon, rises near Naseby, in Northamptonshire, flows through the counties of Leicester, Warwick, and Worcester, and entering Gloucestershire, empties into the Severn near Tewkesbury, after a course of about 100 m. Stratford, the birth-place of Shakespeare, is situated on the bank of this stream.

AVON SPRINGS, a village of Avon township, Livingston co., N. Y., 19 m. S. S. W. of Rochester; pop. about 900. It is situated on a terrace 100 feet above the Genesee river, commanding beautiful views in all directions, and is reached by the Erie and New York Central railroads. The place is visited by large numbers in summer for its mineral waters, which are deemed beneficial in rheumatism, dyspepsia, and cutaneous diseases.

AVOUELLES, a parish of Louisiana, intersected by Red river, which joins the Mississippi near its S. E. angle; area, 800 sq. m.; pop. in 1870, 12,926, of whom 6,175 were colored. The surface is nearly level and is subject to inundation. The western portion is fertile. In 1870 the parish produced 175,330 bushels of Indian corn, 24,985 of sweet potatoes, 73,385 lbs. of rice, 10,139 bales of cotton, 325 hhds. of sugar, and 25,600 gallons of molasses. Capital, Marksville.

AVRANCHES, a town of France, in Normandy, capital of an arrondissement in the department of La Manche, situated on the *Sée*, within 3 m. of the sea and 66 m. S. of Cherbourg; pop. in 1866, 8,642. It stands upon a hill looking toward the Channel islands, and contains the remains of a fine cathedral, consecrated in 1121, and possessing the stone on which Henry II. of England knelt to do penance for the murder of Becket. The cheapness of living and attractive scenery of the town have made it a resort for English families. In the 14th

century it came into the possession of the English, who retained it till 1450. Avranches has several public institutions, including a library, and some manufactures of lace and blonde.

AWE, Loch, a lake in Argyleshire, Scotland, 8 m. N. W. of Inverary. It is 24 m. long, and in few places more than 1 m. wide, encircled by rugged and precipitous mountains, the loftiest, Ben Cruachan, 3,670 feet in height. Its surface is dotted with small islands. On Innishail are the remains of a small Cistercian nunnery, and a churchyard containing many curious old tombstones. On Innis Fraoch are some traces of an ancient castle, formerly the residence of the chief of the M'Naughtons. Innish Chonnel was for several centuries the residence of the Argyll family. The castle of Kilchurn, whose square tower was built in 1440 by one of the Campbells, the founder of the Breadalbane family, stands on a rocky point of land, near the head of the lake. It was garrisoned as late as 1745 by the king's troops, but is now deserted. Several small streams flow into Loch Awe, one of which connects it with Loch Avich, and another with Loch Etive, an arm of the sea. The lake is celebrated for its trout and salmon.

AX, a town of S. France, in the department of Ariège, 21 m. S. E. of Foix; pop. 1,679. It is situated at the foot of the Pyrenees, over 2,000 feet above the level of the sea, in the midst of granitic mountains and at the junction of three valleys out of which flow the sources of the Ariège. It is celebrated for picturesque scenery, and especially for containing the greatest number and the hottest sulphurous springs in the Pyrenees. Near the hospital is a bath established in 1200 for the cure of leprosy, and still called leper's basin. Ax has been widely known as a watering place nearly 100 years, and contains now a number of bathing establishments, the so-called gun spring being the hottest. Over 50 springs issue from the junction of the slate and limestone with the granite, varying in temperature from a little over 100° to nearly 200° F.; and they burst forth so abundantly on all sides that the place has been figuratively described as being built over a subterranean reservoir of boiling water.

AXAYACATL, a Mexican emperor, died about 1477. He was the father of Montezuma II., and reigned 14 years. He was already famous as a warrior when he became emperor of the Aztecs, and inaugurated his reign by a successful expedition against Tehuantepec, and in 1467 conquered anew the cities of Cotata and Tochtepec. A little later he repelled the tribes who strove to get possession of the Mexican capital, and maintained a vigorous warfare against his neighbors. He was defeated by the natives of Michoacan, whom he attacked with inferior forces, and on his return to Mexico celebrated funeral solemnities. He was preparing another expedition when he died suddenly and prematurely. The palace of Axayacatl, a gigantic pile of stone buildings, became

50 years later the barracks of the Spaniards. His treasures were discovered by Cortes within a concealed door, and the chronicler of the conquest exclaims that "it seemed as if all the riches in the world were in that room." They consisted of gold and silver in bars and in the ore, many jewels of value, and numerous rich and beautiful articles of curious workmanship, as imitations of birds, insects, or flowers.

AXE, an instrument for cutting down trees and chopping wood, usually formed of iron and steel, with a handle or helve, of suitable size and length for wielding with both hands, inserted in an eye running horizontally through the head. Smaller instruments of similar form, for use with one hand, are called hatchets (Fr. *hachette*, diminutive of *hache*, axe). The axe is one of the earliest tools suggested by the needs of man, and among all antique relics we find almost invariably some species of axe. The bone and flint tool of different Indian races; the metallic axe, mixed copper and tin, of South America and Mexico, sufficiently hard to cut porphyry and granite; the similar tool of the Romans; the Druidical copper axe, and the rough iron instrument of northern nations, all witness the primitive use of this implement. The increased science of more recent times constructs the axe of iron edged with steel; but anciently the use and combination of these metals were comparatively unknown. With the progress of civilization, the increasing wants of the race, and the colonization of new and fertile countries, the use of axes has proportionately increased with that of various other edge tools. In the most recent American processes, the iron used in making axes is hammered bar iron, the bars of different lengths, but definite sizes, differing for different tools; it is heated to a red heat, cut of the requisite length, and the eye which is to receive the handle punched through it; it is then reheated, and pressed between concave dies till it assumes the proper shape. The Spanish axe is made by the old process of hammering out the bar and turning it in a loop to make the eye, as this kind of axe has no head. The axe is now heated and grooved upon the edge, receiving in that groove the piece of steel which forms the sharp edge; borax is used as a flux, and at a white heat the axe is welded and drawn out to a proper edge by trip-hammers. The next process is hammering off the tool by hand or machinery, restoring the shape lost in drawing out; it is then ground to form a finer edge. The axe is now hung upon a revolving wheel in a furnace, over a small coal fire, at a peculiar red heat, judged by the eye, afterward cooled in salt and water, then in fresh water, and removed to another furnace, where it receives the last temper at the hands of skilled workmen. Then it is ground upon stones of a finer grain than before, and is ready for the polishing wheel. Next it is polished to a finish that shows every flaw, and enables it to resist rust and enter wood easily; next it is stamped,

the head blacked with a mixture of turpentine and asphaltum to prevent rust, and finally weighed, labelled, and packed for sale.—Formerly the consumer depended upon the rude forges and limited skill of blacksmiths to supply axes, but since the increased demand there are many small manufactories in different parts of Europe and America. The largest establishment in the world for manufacturing axes and edge tools is that of the Collins company, situated on the Farmington river, at Collinsville, Connecticut. Here, by means of machinery invented for the company by Mr. E. K. Root, the processes of axe-making are brought to extreme perfection. The establishment was begun in 1826, on a small scale, by Messrs. S. W. and D. C. Collins. After some years it passed into the hands of a company, known now as the Collins company. The amount of capital invested here is \$1,000,000. Eighteen hundred tons of iron, 850 tons of cast steel, and 7,000 tons of coal are consumed annually; from 450 to 500 men are employed; 13 large water wheels and two engines supply the motive power of the machinery; and from 1,500 to 2,000 edge tools and other implements are made daily. The largest American manufacturers after the Collins company are the Douglas axe company of East Douglas, Mass., and those of Cohoes, N. Y.

AXEL. See **ABSALON**.

AXIM, a town of Africa, coast of Guinea, at the mouth of the Ancober, 78 m. W. of Cape Coast Castle. Until the year 1642 it was occupied by the Portuguese, when it was taken from them by the Dutch, who were confirmed in their possession by the treaty of Westphalia, and in 1872 ceded it with the remainder of their possessions in Guinea to Great Britain.

AXINITE, a mineral occurring in flat, prismatic crystals, with sharp edges, like an axe. It consists chiefly of silica, alumina, lime, and oxide of iron.

AXLE, a piece of timber or a bar of iron which supports the body of a car, carriage, or wagon, and is itself supported on two wheels, in the hubs or naves of which its ends are inserted. A great change was introduced about 45 years ago in the shape of axles for carriages, by the English invention of air-tight closed boxes, which with slight modifications has been adopted all over the world. The wheels of carriage axles are prevented from falling out by means of a collar on the axle, which enters the hub on the inside, and not by a nut and pin on the outside, as usual in common vehicles. The introduction of railroads has made another change necessary. Axles for railroads, instead of revolving in the hubs of the wheels, are strongly keyed in them, and journals are turned on the portions outside the wheels. These journals pass through and revolve in boxes attached to the frame of the cars. This arrangement has been found to resist vibrations and jerks resulting from high velocity much better than the old plan. It was, moreover, necessary

to insure a distance between the rims of the wheels invariably equal to that of the rails. It has been attempted to divide axles in the centre, the inner ends of the two half axles being maintained in boxes fixed in slides on a frame, and the body of the carriage acting as a lever on a small mechanism, and bringing each axle perpendicular to the curve of the road. One wheel has also been made to revolve around the axle, which was fixed to the other wheel, and turned with it; in this way railroad cars would turn a short curve without straining the axle. Such arrangements, however, have never been extensively introduced, as the disadvantages from complexity and loss of strength outweigh the advantages gained in turning curves. In horse cars running on city railroads, the difficulty of turning street corners, through curves of very short radius, is simply met by causing the outer wheel to run on its flange on a flat rail; it thus acts as a larger wheel and passes through a greater distance with the same number of revolutions as the inner wheel, and thus describes a curve, notwithstanding the wheels are all immovably connected with the axles. The difficulty of turning curves is not only in the straining of the axles immovably fixed to the wheels, but also in the rigid parallelism of the forward and rear axles, which opposes the turning of a curve the more in proportion as the car is longer; and as American passenger cars are very long and curves very common, the so-called truck system was adopted, consisting in a frame turning on a vertical axle or pivot, and supported by four or six wheels, of which the axles are parallel. Such a four or six-wheeled frame or truck is placed at each end of the car; and in going around curves the trucks adapt themselves by turning on the central vertical pivot. In Europe, where curves are more avoided regardless of expense, and cars are shorter, this system has not been adopted, except in a few exceptional localities, where curves of short radius could not be avoided in the construction of the road. The only kind of locomotive where the wheels are not immovably connected with the axle are those lately built for common roads, in some of which the connection is ingeniously made with a gearing, so that notwithstanding both wheels act as driving wheels, they are not compelled to make the same number of revolutions, and thus are able to turn any short curve in a common road.

AXMINSTER, a town in the county of Devon, England, on the left bank of the Axe, 24 m. E. by N. of Exeter; pop. 2,900. It is well known on account of its rich and beautiful carpets, woven in one piece, which rivalled those of Turkey and Persia; but the manufacture has now ceased. The town is mentioned in Domesday Book, and is believed to have existed from very early times. An action was fought near Axminster in the civil wars in 1644.

AXOLOTL, the Mexican name of an amphibious reptile, described by naturalists as *siredon*.

This tadpole-formed reptile has the vertebrae biconcave, and the body elongated and formed for swimming. The feet are four, the anterior being four-toed, the posterior five-toed; the sides of the body are marked by several small furrows, and an imperfect lateral line is continued from the gills to the tail. The head is flattened, with a rounded or truncated snout, near the end of which are the nostrils; the eyes are small, and about midway between the angle of the mouth and the nose; the tail is elongated and compressed, and tapers to a point. A thin membrane commences near the back of the head, rising gradually to the middle of the tail, and diminishing again toward the tip; underneath, it extends from behind the vent to the tip, reaching its greatest height at its anterior third. The axolotl belongs to the perennibranchiate order, or those whose gills remain through life, coexisting with rudimentary lungs; hence its respiration is always aquatic. The gill openings are large, and the gill covers are continuous beneath the throat, so as completely to separate the head from the breast. The gills consist of four semicircular cartilaginous arches, serrated internally like those of fishes, and externally provided with

Axolotl

fine branchial fringes, occupying thickly the lower edge of the flaps, and a few on the tip of the upper edge. The fringes are flattened, tapering, and disposed in a double row. A generic character is the presence of four external flaps, provided with respiratory fringes. There are two rows of teeth in the upper and lower jaw. There are three species described: *siredon Mexicanus*, Shaw; *S. maculatus*, Owen; and *S. lichenoides*, Baird. It is probable that other species exist, as there are many localities in Mexico, New Mexico, and Texas where "fish with legs" are common. The axolotl is about 10 inches long, of a dark brown color, with blackish spots. Great numbers are taken in the month of June from a lake about 3 m. from the city of Mexico, at an elevation of more than 8,000 feet above the level of the sea, and from water whose temperature is never below 60° F. At this time they form the principal food of the peasantry.—From the experiments of Prof. O. C. Marsh, it appears that the axolotl is the larval condition of the salamandroid batrachian *amblystoma*, usually regarded

as belonging to a distinct family. During an excursion in August, 1868, Prof. Marsh obtained from Lake Como, a small brackish sheet of water in Wyoming territory, several specimens of *siredon lichenoides* (Baird). On bringing them to New Haven, they went through a metamorphosis similar to that previously noticed by Duméril in the Mexican axolotl. The first indication of the change was the appearance of dark spots on the sides of the tail, followed soon by the disappearance by absorption of the membrane along the back and below the tail. Then the external branchiae began to be absorbed, and the animal came more frequently to the surface of the water for air. The spots gradually extended over the body, the external branchiae and branchial arches disappeared, and the openings on the neck were closed by the adhesion of the opercular flap. The body diminished in size; the head became more rounded above and more oval in outline; the eyes became more convex and prominent; the opening of the mouth grew larger, and the tongue considerably increased in size; changes took place in the teeth and in other parts of the structure, and finally the animal escaped from the water a true *amblystoma*, not to be distinguished from *A. marmoratum* (Baird). The rapidity of these changes was greatly affected by light and temperature; under the most favorable circumstances the entire series of transformations took place in about three weeks. It is not known that these changes occur in Lake Como, which is about 7,000 feet above the sea; and the creature no doubt breeds in its siredon or larval state. This leads to the belief that all siredons are merely larval salamanders, and to the suspicion that many other so-called perennibranchiate batrachians, as *menobranchius*, *siren*, and *proteus*, may be the undeveloped young of other well known species.

AXUM, or **Axum** (anc. *Axume*), a city of Abyssinia, in the province of Tigré, formerly capital of a kingdom, in lat. $14^{\circ} 5' N.$, lon. $38^{\circ} 27' E.$, 12 m. W. of Adowa; pop. about 4,000. It is 7,200 ft. above the level of the sea. Parkyn visited this city in 1843. There stands in it a church considered the most sacred building in all Abyssinia, "around which lie scattered unfinished and broken columns, pedestals, and other remnants of the civilization of former ages." This church is about 200 years old. Near it is a square enclosure, with a pillar at each angle, and a seat and footstool in the centre, all of granite. Another footstool, standing apart, about 30 yards distant, has become celebrated for its Greek and Ethiopic inscriptions, the latter in such minute characters and so indistinct that the traveller Salt could transcribe but little of it. They give a list of tribes under the dominion of the king of Axum, and indicate the existence of an extensive and powerful kingdom in Abyssinia, where arts and arms were well known and cultivated. There were originally 55 obelisks at Axum.

One of the most remarkable of these, a single shaft of granite, 60 ft. high, is still standing in good preservation. It is destitute of hieroglyphics, and, instead of ending in a pyramid like the Egyptian obelisks, terminates in a kind of patera, indicating that it is of Greek rather

Royal Seat, Axum.

than of Egyptian origin. Tradition says it was erected in the time of the emperor Aizanas (the middle of the 4th century). In ecclesiastical history there is preserved a letter of Constantius, addressed to Aizanas and Sazanas jointly, calling them the "Axumite princes." The stone also gives the name of the Abyssinian

Obelisk of Axum.

monarch as Aizanas, and mentions Sazanas. Axum was probably the first place in Abyssinia into which Christianity was introduced. It was formerly the centre of the ivory trade.

AYACUCHO. I. An interior central department of Peru, lying mainly on the eastern slope of the Andes, watered by the rivers Mantaro

(which partly bounds it N.), Pampas, and Apurimac; area, about 85,000 sq. m.; pop. about 150,000. Consisting partly of elevated plains and partly of deep valleys, it has a varied climate, cold in the one and excessively hot in the other. It is only partly included in the great metalliferous region; yet gold and silver are found in parts. Agriculture and bee-keeping are the principal industries; and there are many horses, cattle, sheep, llamas, and vicuñas. The department derives its name from a battle fought Dec. 9, 1824, near the hamlet of Ayacucho, between the Spaniards and South Americans, in which the former, though 9,810 strong, while their enemies numbered only 5,780, were totally routed, with a loss of 2,600 killed, wounded, and prisoners, the South Americans losing less than a thousand. The Spanish viceroy and commander, Laserna, was captured, and on the following day Gen. Canterac, who succeeded to the command, surrendered the rest of the army in the field, Laserna signing a capitulation, which delivered up all the Spanish troops, posts, and munitions of war in Peru. The South Americans were commanded by Gen. Sucre. This battle, which lasted only a few hours, virtually secured the independence of all the Spanish possessions in South America. II. A town, the capital of the preceding department, formerly called Huamanga or Guamanga, 220 m. S. E. of Lima, in a valley about 9,000 ft. above the level of the sea; pop. with suburbs, about 25,000. It was founded by Pizarro in 1539. The houses are generally of massive construction surrounded by gardens. The cathedral is a fine structure, and there are 23 other churches and chapels. It is one of the handsomest and most thriving cities in South America.

AYALA, Pedro Lopez de, a Spanish poet, chronicler, and soldier, born at Murcia in 1382, died at Calahorra in 1407. He held high offices under successive kings of Castile, was one of the supporters of Henry of Trastamara, and at the battle of Najera, in 1367, where he bore the banner of that leader, was made prisoner by Edward the Black Prince, and carried to England. He there wrote in prison his *Rimada de Palacio*, or "Rhyme of the Court." Having obtained his liberty, he returned to Spain, and was first minister of state, until in 1385 he was again taken captive in the battle of Aljubarota and carried prisoner to Portugal. He wrote a chronicle which begins at 1350, where that of Alfonso XI. ends, and embraces 46 years.

AYAMONTE, a city of Spain, in the province and 24 m. W. of the city of Huelva, near the mouth of the Guadiana; pop. about 6,000. The town is strongly fortified, but difficult of access, owing to the bar at the mouth of the river. The inhabitants are chiefly engaged in the sardine, tunny, and cod fisheries.

AYE-AYE, a curious animal discovered by Sonnerat in Madagascar, constituting the genus *cheiromys* of Sonnini. The common name

seems to have been derived either from an exclamation of the natives or the cry of the animal; the generic name, meaning "handed mouse," implies its resemblance to a large rat, with feet like hands. Ouvier placed it among the rodents, near the flying squirrels, but he recognized the mouse-like structure of the head; Shaw, Schreber, and later Owen, ranked it among the lower quadrumana, the *lemurida*; while Van der Hoeven regarded it as a link between the monkeys and the rodents. Its probable place is among the quadrumana, near the lemurs, though it has interesting affinities to the rodents and bats. The incisor teeth are like those of rodents in number, position, and length of root, though more compressed laterally and sharp-pointed; the canines are absent; the molars are 4 above and 3 below on each side. In its head and general shape it resembles the galagos of the lemur family; the large, flat, erect, and naked ears are like those of the bats; the last two joints of the middle finger of the fore feet are very long, slender, and bare, useful in picking larvae out of holes in trees, and perhaps in climbing; all the feet have 5 fingers, the thumbs of the hind feet being op-

Aye-Aye (Cheiromys Madagascariensis).

posable to the others, as in the monkeys; the head is rounded, and the muzzle short and pointed; the tail is long, heavily furred, and trails upon the ground. The color is rusty brown above, the cheeks, throat, and under parts light gray; paws nearly black; the hair is thick and downy, of a golden tint at the roots. It is about the size of a hare, the tail being as long as the body. The movements are slow, but more active than those of the loris. The eyes are large, yellow, and sensitive to light, as in all nocturnal creatures. It is believed to be a burrower, though it is also found on trees. The food is probably both fruits and insects, as in the lemur family; it thrives in captivity on boiled rice. It sleeps by day, curled up in the hollow of a tree or other dark place. Unlike the quadrumana, this animal has the mammae on the lower part of the abdomen, instead of upon the breast.

AYASALOOK, or *Alasaluk*. See **EPHESUS**.

AYESHA, or *Asha*, the favorite wife of Mohammed, born at Medina in 611, died there about 678. She was the daughter of Abubekr, and was but nine years old when she was betrothed

to the prophet, who cherished an especial regard for her, though she bore him no children. The 24th chapter of the Koran was written by the prophet expressly to silence those cynics who doubted Ayesha's purity. She survived Mohammed about 46 years, and had an active part in the contest against Ali, who took her prisoner with arms in her hands, but pardoned her. Her opinion was sought sometimes on difficult points in the Koran, and had the force of law with good Sunnis.

AYLESBURY, a market town, parish, and parliamentary borough of England, county seat of Buckinghamshire, 87 m. N. W. of London; pop. of the borough in 1871, 28,760. The town is very old and irregularly built, but well paved, and lighted with gas. Straw plaiting is extensively carried on, and ducks are raised in great numbers for the London market. The manufacture of lace, formerly an important industry, has diminished greatly of late years. There is one silk factory.

AYLMER, John, bishop of London, born at Tilney in Norfolk in 1521, died June 8, 1594. He was sent to Cambridge by the marquis of Dorset, afterward duke of Suffolk, but graduated in divinity at Oxford, after which he became the duke's chaplain and tutor to his daughter, Lady Jane Grey. On the accession of Queen Mary, in 1558, Aylmer was compelled to give up the archdeaconry of Stow in Lincolnshire, to which he had just been appointed, and fled to Switzerland. In his exile he published a reply to John Knox's "First Blast," against the propriety of women holding the sovereign sway, and complimented Elizabeth. Returning to England after the accession of the latter, he manifested much zeal in favor of the reformed faith, was made archdeacon of Lincoln in 1562, and was a member of the synod which reformed and settled the doctrine and discipline of the Anglican church. He was made bishop of London in 1576, and in this capacity became so unpopular, on account of his intolerance toward the Catholics and the Puritans, that the privy council rebuked his severity. He was a ripe scholar and a popular preacher, but published nothing except his courtly answer to John Knox.

AYMARAS, the name of the earliest known inhabitants of the Alpine valleys of S. E. Peru and N. W. Bolivia, whose descendants, save a few in the Peruvian province of Puno, are now to be found only in the Bolivian provinces of La Paz and Oruro. They claim descent from the Collagusa, who at a very remote period migrated from the north, and constituted the sacred isle in Lake Titicaca the centre of their government and religion. Though distinct in language, they physically resemble the Indians of the great Quichuan or Inca family, who were indebted to them for a part of their religious rites and the knowledge of the arts. They worked skilfully in gold and silver, tilled the ground, built splendid edifices ornamented with sculpture and painting, and were

somewhat versed in astronomy. Their poetry and religion were spiritualistic; their priests were bound to celibacy, and the dead were held in religious veneration. Their skin is of an olive-brown color; their features, though regular, are strongly marked, the cranium capacious, and the general cast of the countenance thoughtful and melancholy. The women are rarely handsome. The Aymaras have embraced Christianity, and are zealous observers of all the rites of the Roman Catholic faith, in the performance of which, however, they introduce some relics of paganism. Their chief occupation is husbandry. As the Incas grew in power they gradually subdued the Aymaras, and ultimately overran their whole territory. The Aymaras probably number 200,000 at the present day. In early times they were accustomed to mould the craniums of infants to a conical shape. They worshipped

Aymaras, and an Aymara Tomb.

the sun, and believed the present luminary to be the fifth, and that, after a long period of darkness, it emerged from the sacred island in the lake. The monuments of Tiaguanaco, remains of many of which are still standing, indicate a much higher civilization than do those of Palenque. (See **TITICACA**.) Their tombs, sometimes large square buildings with a single opening through which the body was introduced, contained 12 bodies placed feet to feet around a confined cavity, sitting in their clothes. Some of these tombs are small houses of sunburnt bricks; some are square towers of several stories, containing each a body; but whatever be the size, they are always joined in groups, with the opening facing the east.

AYMAR-VERNAY, Jacques, a French peasant of Dauphiny, a pretended diviner, born at St. Veran, Sept. 8, 1662; time of death unknown. He was originally a mason, but early abandoned that occupation, and began using the divining

rod, employing it at first in discovering springs, mines, and hidden treasures, and finally in reclaiming stolen property and in detecting the thief. He acquired a great reputation in this way, and at length in 1692, a vintner and his wife having been murdered at Lyons, he was employed to follow up the murderer, and finally charged the crime upon a hunchback in the jail at Beaucaire, who confessed his complicity and was broken on the wheel. The country rang with these events, and innumerable pamphlets were written on the subject in 1692 and

1693. Aymar was invited to Paris by the prince de Condé to display his skill, but failed completely in everything he attempted, and at length admitted that he was an impostor. The mystery of the hunchback was never entirely cleared up.

AYE, the county town of Ayrshire, Scotland, on the frith of Clyde, near the mouth of the river Ayr, 30 m. S. W. of Glasgow; pop. in 1871, 17,851. The town is well built, and has commodious public buildings, a large fish market, and several pleasant squares. The Ayr is here

The Bridge of Ayr.

crossed by two bridges, celebrated by Burns in one of his best known poems. A good harbor is formed by the mouth of the river, but the town has little commerce, though it was

formerly largely engaged in the importation of wine from France. The principal industries are fishing, rope and sail making, and iron founding. Ship building is also carried on to a small extent.—About two miles from Ayr, in what was formerly the parish of Alloway, is the small cottage in which Burns was born in 1759. A monument has been erected to the poet on a hill not far off.

AYER, Jakob, a German poet who flourished at Nuremberg, died in 1605. He is the author of upward of 60 comedies, tragedies, burlesques, and carnival plays, which were published at Nuremberg in 1618, under the title of *Opus Theatricum*. Tieck inserted five of these plays in the first volume of his *Deutsches Theater*.

AYRSHIRE, a county in the S. W. of Scotland, bounded W. by the frith of Clyde, and landward by the counties of Renfrew, Lanark, Dumfries, Kirkcudbright, and Wigtown; area, 1,149 sq. m.; pop. in 1871, 200,745. It is hilly on the southern and eastern sides, the principal hills rising to nearly 2,000 feet. It is intersected by several small rivers. About 10 m. off the coast lies the craig of Ailsa, the top of a submarine mountain with basaltic columns

Robert Burns's Cottage, near Ayr.

similar to those of Staffa. The county abounds in coal, particularly that known as blende coal, which is found in a state of coke; iron, lead, antimony, and various kinds of building stone are also found; and there is a granite valued for mill stones, and a black stone used in building ovens. The county is remarkable for its fine crops and for the general prosperity of its farmers. The manufactures are considerable in linens, woollens, cottons, leather, and other articles. The relics of antiquity, Druidical and Roman, are numerous, while there are also many ruins of buildings of the middle ages. One of the most notable of these in point of interest is Turnberry castle, the ancestral residence of the Bruce. Capital, Ayr.

AYSCUE, Sir George, an English admiral, born about 1616, died about 1676. He entered the navy early, and was knighted by Charles I. In the civil war, siding with the parliament, he had command as admiral in the Irish seas. In 1651 he reduced Barbadoes and Virginia, which had held out for the king. In 1652 he seconded Blake in his contest with Van Tromp and De Ruyter. In June, 1666, in the memorable naval battle of the four days, he commanded a squadron, but his ship (the Royal Prince, the largest ship then afloat) running on the Galoper sands, his men forced him to surrender, and the Dutch captured his vessel. He was held a prisoner for several years.

AYTON, or Aytoun, Sir Robert, a Scottish poet, private secretary to the queens of James I. and Charles I., born at Kinaldie, Fifeshire, in 1570, died in the palace of Whitehall in March, 1638. When James VI. of Scotland became king of England, Ayton was rewarded for a very eulogistic Latin poem by knighthood, and several lucrative offices. His Latin poems, chiefly panegyrical, were published in his lifetime, and much esteemed. His English poems, principally preserved by tradition, were scarcely known until the Ballantyne club at Edinburgh printed a collection of them in their "Miscellany." Some years later a manuscript containing Ayton's poems was picked up at a sale, and the whole, edited by O. A. Pryor, were published in 1844. Burns greatly admired such of Ayton's poems as he had seen—among them the original of "Auld Lang Syne." Ayton was intimate with Ben Jonson and the leading literary men of his time.

AYTOUN, William Edmondstone, a Scottish poet, born in Fifeshire in 1813, died in Edinburgh, Aug. 4, 1865. He was educated in the schools of Edinburgh, where he gained distinction in English and Latin composition. A prize poem, "Judith" (1831), received the applause of Prof. Wilson, whose daughter he afterward married; and encouraged by him he published his first volume, entitled "Poland and other Poems," which attracted but little attention. Mr. Aytoun was called to the bar in 1840, and became well known as a wit and as an advocate in criminal cases. In 1845 he succeeded Mr. Moir as professor of

and belles-letters in the university of Edinburgh, and the lectures which he delivered there were celebrated for their pithy treatment of topics and their brilliant style. He abandoned the liberal political views toward which he tended in his youth, and after the death of Prof. Wilson was the most prominent among the contributors to "Blackwood's Magazine." In this periodical first appeared his celebrated national ballads, "Lays of the Scottish Cavaliers and other Poems" (London and Edinburgh, 1849; 10th ed., 1857). Prof. Aytoun lectured with great success in London in 1853 upon poetry and dramatic literature, and in 1854 published "Firmilian, a Spasmodic Tragedy, by T. Percy Jones," designed to ridicule the raptures of some of the young poets of the day. He also took part in the "Book of Ballads," edited under the pseudonyme of "Bon Gaultier." His last poem was "Bothwell" (2d ed., 1856). He was one of the most effective of British political writers, and in reward for his services to the conservative party he was in 1852 appointed by Lord Derby sheriff and vice admiral of Orkney. Theodore Martin, one of his collaborators, has published a memoir of his life (1868).

AYUNTAMIENTO, the name of village and town councils in Spain. During the wars between the Moors and Christian Spaniards it was the policy of the sovereigns to induce inhabitants and cultivators to settle in the depopulated country as fast as it was recovered. As an incentive they granted to the villages and towns municipal privileges of a character derived from Roman antiquity, and totally antagonistic to the spirit of the feudal law. The town councils were to be composed of the judge, the mayor, the *regidores* or clerks, the *jurados*, and the *personeros* or deputies; all these were elective officers, except the judge or *corregidor*, who was appointed by the king. The only qualification for a citizen was Spanish birth, residence, and to be the head of a family. These privileges were consonant with the most ancient rights of the Spaniards and their Gothic conquerors, but now they were confirmed by *fueros* or charters. The only liability under which the districts thus organized were placed was that of paying a tax to the king, and of serving in arms in defence of the country, under their own alcalde. Their elections were by ballot; persons soliciting a vote or using undue influence were disfranchised. The king himself might not interfere with the proceedings of the *ayuntamiento*, which had supreme control of all local expenditure and taxation. All the citizens in these districts had equal rights. Noblemen had to lay aside their rank and exclusive privileges if they desired to reside in the district. There were no special privileges; all men and all religions were equal before the law. These regulations continued in force for centuries; but under the house of Austria and the early Bourbons frequently encroached upon, until at

the period of the French invasion, while the municipal organizations of the villages and unimportant towns had preserved their integrity, the charters of most of the great towns and cities of the kingdom had been violated, and the rights of the people abridged. During that invasion the constitution of 1812, recognizing and restoring all the ancient fueros, was adopted by the people. This constitution was abrogated by Ferdinand VII. on his restoration, revived by the revolution of 1820, and again suppressed in 1823. The constitution of 1837, however, restored the ayuntamientos. In 1840, in consequence of the check which this system of local government gave to the policy of the court, Queen Christina, by the advice of the French government, introduced a measure intended to restrain the political action of the ayuntamientos. This, although it at the time led to disturbances, was substantially carried out in 1844.

AZAIS, Pierre Hyacinthe, a French philosopher, born in Sorrèze, Languedoc, March 1, 1766, died in Paris, Jan. 22, 1845. He was educated at the Benedictine college of Sorrèze, where his father was teacher of music, and at the college of the Oratorians at Toulouse, and afterward became secretary to the bishop of Oléron, but lost this position on refusing to take orders. He was at first a partisan of the revolution, but having published a pamphlet against its excesses, he was condemned to transportation. He found a refuge, however, in the hospital of the sisters of charity at Tarbes, where he served as secretary and bookkeeper. There he wrote his "Discourses of the Soul with the Creator," and his "Religious Inspirations, or the Elevation of the Soul to the Spirit of God." In these works he first put forth his ideas of eternal justice, and the natural and necessary balance of good and evil in the universe and in the destinies of men. After remaining 18 months concealed in this hospital, he retired to Saint-Sauveur, at the foot of the Pyrenees, and there wrote his book on the "Misfortunes and the Happiness of Life." Here he remained six years, engaged in writing his philosophical "System of Compensations," the best known of his works. He then went to Paris, married the widow of an officer, and was appointed professor of geography in the military school of Saint-Cyr. This office he resigned when the school was removed to La Flèche, and was afterward appointed inspector of bookselling at Avignon, where he published his great work, *Le système universel* (2 vols. 8vo, 1812). The following year he went to Nancy in the same capacity, and commenced a work on the destiny of man. At the downfall of Napoleon he lost his place, and retired again to Paris, where he lived some time in poverty; but his friends at length obtained for him a pension. He lectured publicly at the *Athénée Royal* in Paris, and attracted large audiences; and in 1827-'8 he held conferences in his garden in the suburbs of Paris, which were attended by

the élite of both sexes. In 1826 he published his *Explication universelle*; in 1829, *Principes de morale et de politique*; in 1833, *Cours d'explication universelle*; in 1834, *Idées précises de la vérité première*; in 1835, *De la vraie médecine*, and *De la vraie morale*; in 1836, *Physiologie du bien et du mal*, for which the French academy awarded a prize of 5,000 francs; in 1839, *De la phrénologie, du magnétisme et de la folie*; in 1840, *La constitution de l'univers et l'explication générale des mouvements politiques*, for which the academy awarded another prize of 2,000 francs.

AZALEA (Gr. *ἀζάλεα*, arid), a genus of plants belonging to the natural order *ericaceæ*, and to the sub-order *rhodoreæ*, named in allusion to the dry places in which many of the species grow, and consisting of upright shrubs with large, handsome, and fragrant flowers, often cultivated in gardens. The genus comprises more than 100 species, most of them natives of China or North America, having profuse um-

Azalea viscosa

bellied clusters of white, orange, purple, or variegated flowers, some of which have long been the pride of the gardens of Europe. The general characteristics of the genus are a 5-parted calyx, a 5-lobed, funnel form, slightly irregular corolla, 5 stamens, a 5-celled pod, and alternate, oblong, entire, and ciliated leaves, furnished with a glandular point. The species may be classified into those which have glutinous flowers, and those whose flowers are but slightly or not at all glutinous; each of which classes may be subdivided into those which have short stamens, and those which have stamens much longer than the corolla. Of those which have a glutinous corolla and short stamens are the *viscosa* and the *glauca*, very nearly resembling each other, found native in North America from Maine to Georgia, growing from 4 to 10 feet high, and having many varieties of flowers, either white or tinged with

rose color. Of those which have a glutinous corolla, with long stamens, are the *nitida*, *hispidula*, and *pontica*, the first two being American species and found in mountainous regions in the middle states, the last a native of Turkey and the northern borders of the Black sea, and distinguished by its brilliant yellow corolla. Of those whose flowers are smooth or but slightly glutinous, and have long stamens, are the *periclymena*, or upright honeysuckle, found on hillsides in all the woods of North America; the *canescens*, with a white flower which has a red tube, an early and tender American species; and the *arborescens*, a rare and beautiful shrub, with elegant foliage and very fragrant rose-colored blossoms, found about the Blue Ridge mountains of Pennsylvania. Of those whose flowers are not glutinous, and which have short stamens, are the *sinensis*, nearly resembling the *pontica*; the *indica*, a Chinese species, with brilliant variegated flowers, cultivated in Europe and America as a greenhouse plant; and the *ledifolia*, also a native of China, with evergreen leaves, and larger flowers than those of the preceding. All the American species are deciduous. In cultivation the azaleas love the shade and a soil of sandy peat or loam.

AZARA, Felix de, a Spanish naturalist, born in Aragon, May 18, 1746, died there in 1811. He became a brigadier general in the Spanish army, and was wounded in the warfare against the Algerine pirates (1775). In 1781 he went to South America as one of the commissioners for the settlement of the boundary between the Spanish and Portuguese possessions, and the researches which he prosecuted till 1801, despite the vexatious proceedings of the local Spanish officials, gave him distinction as an authority on the natural and political history of Paraguay and the Plata region. His *Essai sur l'histoire naturelle des quadrupèdes de la province du Paraguay* was first published in French (Paris, 1801), and afterward in Spanish (Madrid, 1802) under the auspices of his brother, the chevalier José NICOLAS DE AZARA (born in 1781, died in Paris in 1804), Spanish ambassador to France, favorably known by a Spanish translation of Middleton's Cicero and by other literary achievements. Felix de Azara's masterpiece, *Voyage dans l'Amérique méridionale depuis 1781 jusqu'en 1801* (4 vols., Paris, 1809), containing a narrative of the discovery and conquest of Paraguay and the Plata river, and in the last two volumes ornithological descriptions translated by Sonnini, was edited by the French naturalist Walckenaer, whose commentaries as well as those of Sonnini and Cuvier impart additional value to the work. A Spanish translation by Varela has been published at Montevideo.

AZARIAH (Heb. *'Azaryah*, or *Azaryahu*, helped of Jehovah), a very common name among the Hebrews. **Uzziah**, king of Judah, is also called Azariah. It was the Hebrew name of the friend of Dr. **Abdullah**, whose name was

Abednego. Apart from these, the most prominent persons bearing the name are a prophet who met *Asa* after his victory over *Terah*, king of *Ethiopia*, and exhorted him to put away idolatrous worship; and a high priest who aided *Hezekiah* in reforming the temple worship.—In its Greek form, *Azarias*, several persons of this name are mentioned in the apocryphal books, one of them being one of the generals of *Judas Maccabæus*, who suffered defeat by *Gorgias*.

AZEGLIO, Massimo Taparelli, marquis d', an Italian statesman, artist, and author, born in Turin, Oct. 2, 1798, died there, Jan. 15, 1866. In his youth, as he says himself in his memoirs, he was a swaggering soldier and a companion of scamps. His father being appointed in 1814 Sardinian ambassador in Rome, he accompanied him and remained there almost uninterruptedly for eight years, acquiring distinction as a painter, and for a time living the life of an artistic hermit in the outskirts of the Roman Apennines. After his father's death in 1830 he married a daughter of Manzoni, and after her death he married Louisa Blondel of Geneva. He was now a man of serious thought and strict virtue, and a decided liberal. His celebrated romances, *Ettore Fieramosca* (Milan, 1838) and *Niccolò de' Lapi* (1841), contributed to rouse the national spirit of independence and to establish his literary fame. In his *Degli ultimi casi di Romagna* (Florence, 1846), as well as by his personal influence with Pius IX., he advocated a liberal policy, while his political writings (collected in 1 vol., Turin, 1851) fostered a reformatory spirit in Sardinia and paved the way for coming changes. In 1848 he was aide-de-camp of Durando, who commanded the papal troops against Austria; but when the latter were recalled he joined the patriot volunteers in fighting the battle of Vicenza against Radetzky, and was severely wounded. After the restoration of peace he was chosen to the chamber of deputies. Victor Emanuel on ascending the throne appointed him (May 11, 1849) premier and minister of foreign affairs, and it was mainly his influence which saved constitutional institutions and paved the way for the work of Cavour. He dissolved the chambers twice on account of their opposition to the treaty of peace with Austria, which he caused to be ratified Jan. 9, 1850. Despite Azeglio's sympathies with progressive measures, he was considered as over-conservative for the new order of things; and he finally succumbed to the combined influence of Count Cavour and Ratazzi and the opposition in the chambers, retiring Oct. 30, 1852. He had already tendered his resignation five months before, and continued in office only at the urgent request of the king. After the outbreak of the war of 1859, he contributed, as the king's commissioner in Bologna, to the preservation of order in the Romagna, and subsequently was for a short time prefect of Milan, his impaired health re-

quiring his retirement and obliging him to have his speeches in the senate read by others. A man of independent character and political opinions, he severely criticised Cavour, Mazzini, and other liberal leaders, and among other popular measures opposed the intended transfer of the capital to Rome. His daughter, the marchioness Ricci, has published his autobiography, or, as he designates it, his "moral autopsy," entitled *I miei ricordi* (2 vols., 2d ed., Florence, 1867; German translation, 1869). A supplementary volume of correspondence between Azeglio and Torelli has been edited by Paoli (Milan, 1870). In 1867 appeared in Paris his *Italie de 1847-1865*, and his *Correspondance politique*, edited by E. Rendu. Carcano published at Milan in 1870 Azeglio's *Lettere a sua moglie Luisa Blondel*; and Barbera of Florence has lately published his *Scritti inediti*.—His brother Luigi, who died in Rome Sept. 24, 1862, was an eminent member of the order of Jesuits, editor of the ultra-clerical *Civiltà cattolica*, and the author of a work on natural and one on international law. His eldest brother, ROBERTO, who died in Turin, Dec. 24, 1862, published some excellent works on art, and was a promoter of political reforms toward the close of the reign of Charles Albert, a senator, and director of the royal gallery of paintings. The son of the latter, the marquis VITTORIO EMMANUELE TAPARELLI D'AZEGLIO, an accomplished artist, especially in statuary, was ambassador of Sardinia and afterward of Italy in London from 1850 to 1868.

AZERBIJAN, or *Azerbailjan*, a N. W. province of Persia, bounded N. and N. E. by the Russian dominions, E. by the Persian province of Ghilan, S. by Irak-Ajemi and Persian Kurdistan, and W. by Turkish Kurdistan and Armenia; area, about 80,000 sq. m.; pop. estimated at 2,000,000. It nearly corresponds to the ancient Median province of Atropatene, from which its modern name is derived. The country is mountainous, with fertile valleys and small plains. Mt. Savalan, apparently once a volcano, is upward of 12,000 feet high. The chief rivers are the Aras (the ancient Araxes), which flows along the N. border, and its affluent, the Karasu. The salt lake of Urumiah is in this province. The climate is generally healthy; the summers are very hot and the winters very cold. In the plains the pomegranate and olive thrive in the open air. The mineral resources of the province are not developed; but there are mines of iron, lead, and copper. The inhabitants are chiefly Mohammedans, but, there are some settlements of Nestorian Christians. Capital, Tabriz.

AZEVEDO COUTINHO, José Joaquim da Cunha, a Portuguese bishop, and the last inquisitor general of Portugal and Brazil, born at Campos dos Goitacazes, in Brazil, Sept. 8, 1742, died Sept. 12, 1821. He studied at Coimbra in Portugal, received orders, and soon became prominent both in the church and in Brazilian politics. He published in 1792 a work entitled

Ensaio economico sobre o commercio de Portugal e suas colonias. In 1794 he was made bishop of Pernambuco. He published in London, in 1798, a pamphlet against the proposition to abolish the slave trade. Shortly before his death he was elected to the cortes as a representative of the province of Rio de Janeiro. He was named bishop of Elvas, but declined, and in 1818 was appointed inquisitor general. He wrote a memoir on the conquest of Rio de Janeiro by Duguay-Trouin in 1711.

AZEVEDO Y ZUÑIGA, Caspar de, count of Monterey, and viceroy of Peru and Mexico, died March 16, 1806. He succeeded Luis de Velasco in the viceroyalty in 1608. He equipped a fleet to search for the great southern continent, which, under the command of Pedro Fernandez de Quiro, discovered several islands.

AZOF. See AZOV.

AZOIC AGE, the period in the earth's history preceding the appearance of vegetable and animal life. A few years ago life was not known to have existed below the lower Silurian rocks, in the Cambrian of England, or in the Taconic (Laurentian and Huronian) of this country. If, however, eozoön be admitted as an animal form, the first appearance of life is carried back in time very much; and now American geologists are disposed to admit an eozoic age between the Silurian and azoic.

AZORES, or *Western Islands*, a group of islands belonging to Portugal in the N. Atlantic, between lat. 36° 55' and 39° 44' N., and lon. 25° 10' and 31° 16' W., about 800 m. from the coast of Portugal; area, over 1,100 sq. m.; pop. about 250,000. They comprise three minor groups, the N. W. consisting of Flores and Corvo, the central of Terceira, San Jorge, Pico, Fayal, and Graciosa, and the S. E. of San Miguel and Santa Maria; and they extend from S. E. to N. W. about 400 m. The largest, San Miguel, is 50 m. long, and from 5 to 12 m. broad. They are all of volcanic origin, and have suffered severely from eruptions and earthquakes. A volcano rose suddenly to the height of 8,500 ft. in San Jorge in 1808, and burned for six days, desolating the entire island. In 1811 a volcano rose from the sea near San Miguel, and after vomiting ashes and stones disappeared. The peak of Pico, on the island of the same name, is 7,613 ft. high. All the islands are rugged and picturesque, with steep shores. The climate is moist but agreeable, and vegetation is luxuriant, fruits abounding, as well as the sugar cane, coffee, and tobacco. The principal exports are wine, brandy, oranges, lemons, beef, pork, and coarse linens, and their value is about \$1,200,000 annually. The imports, valued at \$1,700,000, comprise woollen and cotton goods, iron, glass, pitch, timber, rum, sugar, tea, coffee, fish, &c. The tonnage entered in 1867 was 119,371; cleared, 117,690. There are no good harbors, the least exposed being Angra, on the island of Terceira.—The Azores were laid down on the

maps of the 14th century, but little was known of them till 1482, when they were occupied by the Portuguese, being then uninhabited, and were named *Açores* from the great number of hawks (Port. *apor*, hawk) observed on them.

AZOTE. See NITROGEN.

AZOV, or *Azof*, a town and fortress of Russia, in the government of Yekaterinoslav, on the river Don, about 7 m. from its entrance into the sea of Azov, 24 m. S. E. of Taganrog; pop. about 6,000. Built in a remote time near the ancient Greek colony named Tanais, it carried on an extensive commerce with the northern peoples; but the silt deposited by the river has blocked up the port, and its commerce has been transferred to Taganrog. In the 13th century Azov was taken by the Genoese, who called it Tana; they were driven out in 1392 by Tamerlane. In 1471 it was taken by the Turks, who gave it its present name. In 1696 it was captured by Peter the Great. During the next century it changed hands several times between the Russians and the Turks; but in 1774 it finally fell into the hands of the Russians. It was bombarded and almost destroyed by the allies in 1855.

AZOV, or *Azof*, Sea of (anc. *Palus Maotis*), an inland sea of southern Russia, lying between lat. 45° 20' and 47° 20' N., and lon. 35° and 39° E. The Turks call it *Balik-Denghia*, or Fish sea, from the abundance of fish in its waters. Its extreme length from N. E. to S. W. is about 285 m.; breadth about 110 m.; area, 14,000 sq. m. The waters are nearly fresh, very shallow, encumbered with sand banks, and navigable only by vessels of small draught. The sea is properly a gulf of the Black sea, with which it is connected on the south by the strait of Yenikale or of Kertch (anc. *Bosporus Cimmerius*), about 80 m. long. For four months it is frozen over, the navigation opening early in April and closing late in November. The Siwash, or Putrid sea, a western continuation of the sea of Azov, is cut off by a long narrow slip of land called the tongue of Arabat, and entered by the strait of Genitchi, at the north of the tongue. It is separated from the Black sea by the isthmus of Perekop. The Putrid sea is little more than a long reach of swamps. The Don is the largest river emptying into the sea of Azov.

AZTECS, properly the name of one only of the various tribes or nations who at the time of the conquest in the 16th century occupied the plateau of Anahuac or Mexico, though generally used as synonymous with Mexicans. These tribes were the Xochimilcos, Chalcos, Tepanecas, Acolhuas, Tezucucans, Tlascaltecas, and Aztecas, which collectively bore the name of Nahuatlacas, and their language was called Nahuatl. Tradition variously represents these families as emerging from seven caverns in a region called Aztlan (from the Nahuatl words *Astati*, heron, and *tlan* or *titlan*, place or place of), or as wandering away from their fellows subsequently to a grand cataclysm, and after a

distribution of tongues. These traditions, however, do not fall within the domain of history, and critical writers have generally preferred to confine their researches within the period fixed by the Mexican paintings or records. Several of these are in existence, and although differing considerably in their chronology, they do not carry back the history of the Aztecs and their affiliated tribes beyond the 11th and 12th centuries of our era. There is abundant evidence, nevertheless, that the plateau of Mexico was occupied for many ages anterior to the arrival of the Nahuatlacas by a people of much higher culture, of whose civilization that of the Aztecs was but a rude reflection. (See TOLTECS.) The locality of the traditional Aztlan has been a subject of much speculation. By some writers it has been supposed that this primitive seat of the Nahuatlacas was in Asia, and that the paintings, all of which depict the passage over a body of water in canoes or on rafts, represent

Aztec Warriors. (From a Mexican Sculpture.)

a migration to America from that continent. Most, however, imagine Aztlan to have been somewhere to the north of Mexico, beyond the river Gila, the so-called *casas grandes* found there having been erroneously thought to be the work of the Aztecs. (See CASAS GRANDES.) But it is worthy of remark that no native history, chronicle, or known hieroglyphic of the Mexicans assigns a northern origin to the Aztec tribes, except the relation of Ixtlilxuchitl, who wrote a considerable time after the conquest, and who in this matter only followed the Spanish authors who had preceded him. In the painting representing the migration of the Aztecs, originally published by Gemelli Carrera in his *Giro del Mondo*, the sign or hieroglyphic of Aztlan is accompanied by the representation of a teocalli or temple, by the side of which stands a palm tree—a circumstance which excited the astonishment of the cautious Humboldt, as opposed to the opinion that Azt-

lan was to be looked for in a northern latitude. The palm certainly points southward as the direction whence the traditional migration took place; and this indication is supported by the fact that a people speaking the same language with the Aztecs (the Nahuatl), and having identical habits, laws, and religious observances, existed as far south as Nicaragua, and at the time of the conquest occupied nearly the whole of the present state of San Salvador in Central America.—The next question concerns the date of the departure of the seven tribes from Aztlan. According to Gemelli's painting, this event happened in the year 1038 of our era; according to the astronomer Gama, in 1064. Veytia follows Gama; but Clavigero fixes the period nearly a century later, in 1160. But great uncertainty is attached to all dates previous to the foundation of the city of Tenochtitlan or Mexico, which all accounts concur in fixing in the year 1324 or 1325. Tradition and the paintings represent that various halts and stoppages took place after leaving Aztlan, before the seven tribes reached the valley of Mexico; and the time occupied is variously estimated from 56 to 163 years. According to the painting obtained by Boturni representing this migration, they made not less than 22 stoppages, varying from 4 to 28 years in length—altogether occupying 162 years, before reaching Chapultepec. It does not appear that the various tribes all arrived at the same time in the valley of Mexico, but came in and took up their positions successively. They found the country rich and attractive, and occupied by only a remnant of an anterior and powerful people, who had left numerous monuments of their greatness. From these they learned many of the arts of life, the cultivation of the soil, and the working of metals. At first they seem to have lived in harmony with each other; but gradually the stronger tribes began to encroach upon the weaker, which led to combinations for defence among the latter, and to a long series of bloody forays and wars. The Mexicans (subsequently so called from Mexi, one of their war chiefs) ranked as the seventh tribe, and seem to have assumed the name of Aztecas *par excellence*. They were established first at Chapultepec, but gradually encroached upon the Chalcos, and finally, under the lead of a succession of military chiefs, became the most powerful tribe in Anahuac, and established their imperial city in the lake of Chalco. This event took place in 1324 or 1325, under the reign of Tenuch, and the city was called Tenochtitlan, the place or seat of Tenoch or Tenuch. The site, like that of Venice—a few low islands in a great lake—was admirably chosen for defence, and the Mexicans exhausted their art in strengthening the position. It could only be approached over long and narrow causeways, easily defended, and which even the Spaniards were not successful in forcing. Commanding the lake with numerous fleets of boats, they were unassailable from the water. From this

stronghold they gradually reduced their neighbors, their companions from Aztlan, or forced them into a kind of dependent alliance, which served still further to build up their power and influence; so that, at the time of the arrival of Cortes, the Mexican emperor exercised a qualified dominion over nearly all the aboriginal nations embraced within the present boundaries of the republic of Mexico. This power was often exercised without mercy, and many thousands of their captured enemies were sacrificed on the altars of their sanguinary divinities. How severely their yoke was felt, and how eagerly it was thrown off, is shown by the readiness with which the Tlascalana, their own kindred, joined the Spaniards in their attack on the Mexican capital.—The form of government among the Mexicans was an elective monarchy; and the legislative power resided wholly with the king. The administration of the laws belonged to certain judicial tribunals, and was conducted with great regularity and with Draconic sternness. Their religion was sanguinary in most of its practices; yet it combined the elements of a milder system, probably, than that of their Tlhuatcan predecessors, whose religion was closely allied to the Buddhist system of India. As essentially a warlike nation, they made the highest beatitudes of their faith the rewards of the bravest soldiers; and while the soul of the common citizen after death was believed to be subject to a purgatorial existence, that of the warrior who fell in battle was caught up at once to the abode of the gods, to the bosom of the sun, the heaven of eternal delights. In the arts, and especially in their architecture, the Mexicans achieved an advance corresponding with their numerical and political growth; and the islands, which at the outset supported only rude huts of cane and thatch, came finally to be covered with imposing edifices of stone and lime. Metallurgy was extensively practised, and gold and silver, copper, and a species of brass were well known and elaborately worked; but iron, except in its meteoric form, was unknown. For accounts of the political, social, and religious practices, customs, and organization of this interesting people, whose subversion forms the most dramatic incident in the history of this continent, see the works of Sahagun, Solis, Clavigero, Prescott, and Baldwin. The following chronological table is from an unpublished Mexican painting or MS., in the possession of Mr. E. G. Squier:

Aztecs leave Aztlan.....	A. D. 1164
Arrive in Valley of Mexico.....	1216
Tenotinkatonl, founder of Mexico, commences to reign.....	1234
Acamapichtli, second king.....	1273
Huitzilhuitzin.....	1294
Chimalpopoca.....	1313
Itzcohuatzin.....	1328
Hue Monctecumatzin (Montezuma I.).....	1368
Axayacatzin, king.....	1471
Ticopicatzin ("Tlao").....	1499
Ahuizotzin.....	1514
Monctecumatzin (Montezuma II.).....	1519
Entry of the Spaniards.....	1519

AZURARA, Gomez Eannes de, a Portuguese historian, born at Azurara, died in the latter part of the 15th century. Although he was early made a monk and admitted into the order of Christ, he passed his youth as a soldier, and in 1459 was appointed to reform the archives of the state. His principal work was a chronicle of the discovery and conquest of Guinea. This was discovered in the *bibliothèque royale* of Paris in 1837, and published (8vo, Paris, 1841) by the Portuguese ambassador at the French court, the visconde de Carreira, who transcribed the MS. with his own hand.

AZYMITES (Gr. *άζυμος*, not, and *ζύμη*, leaven), a polemical term, applied to the western church by the eastern or Greek branch. About 1025 a controversy sprung up as to the kind of bread that

ought to be used in the eucharist. The Latin church maintained that unleavened bread only was allowable, since, as they affirmed, the Lord's last supper having been held on the day before the Hebrew passover, unleavened bread was the only kind procurable. The Greek church endeavored to prove that the last supper did not take place on the day before the passover, and consequently that unleavened bread could not be had; moreover, they charged that the use of unleavened bread was a relic of Judaism. The term *azymites* was at first used as one of reproach, but was adopted as honorable by those to whom it was applied. The controversy raged long and high, the parties calling themselves *azymites* and *prozymites*, anti-leaveners and pro-leaveners.

B

B, THE second letter in all languages whose alphabets have a Phœnician origin, as Hebrew, Greek, Latin, English, French, German, Italian, Spanish, and Russian. In English, French, and German it is strictly a palato-labial, the sound being produced by compressing the air within the mouth, vocalizing it by the vibrations of the membranes forming the palate or roof of the mouth, the uvula at the same time closing the nasal orifices. The sound can be imperfectly formed and prolonged while the lips are tightly closed. The perfect sound is produced at the commencement of a syllable by a sudden opening of the lips for the passage of the vocalized breath; at the close of a syllable by suddenly closing the lips upon the vocalized current. It differs from P in that in sounding the latter the breath passes out without compression and vocalization. In Spanish, in later Latin and modern Greek, the prevalent sound of B is nearly identical with that of V, produced by pressing the upper teeth upon the lower lip, causing only a partial closure of the mouth, so that the sound can be indefinitely prolonged. Thus in modern Greek (as perhaps in the ancient), *βασιλεύς* is pronounced *vasilefs*, the *v* having its consonantal sound. The Greek B sometimes, though not always, represented the Latin V; thus *Virgilius* was written *Βυργίλιος* or *Ουβυργίλιος*. The Hebrew *beth* has the sound of V except when a diacritical point indicates that it is softened to B. In the passage of a word from one language to another an interchange not unfrequently takes place between B and P, F (*ph*), V, and less frequently M. For example: Lat. *ab*, Gr. *ἀπό*, Eng. *off*; Gr. *βροτός*, Lat. *mor[t]s*. In German, B, chiefly at the end of words, is often pronounced like P; thus, *ab* like *ap*. The sound of B, being formed with the mouth closed, is wanting in many of the dialects of the American Indians, who approximate almost

wholly with the lips open.—In the calendar B is the second dominical letter. In music it is the seventh degree of the diatonic scale of C, and the 12th of the diatonic-chromatic scale. According to the tempered system of tuning, the ratio of B to the fundamental note C is $\frac{7}{4}$. In the ancient diatonic scale B was not used as a key-note, its fifth, F, being imperfect. In the German notation our B is called H, B flat, half a tone lower than B, being called B. As a numeral, β among the Greeks represented 2, and with a stroke beneath 2,000; among the Romans B was occasionally used to denote 300, and with a line above it 3,000.

BAADER, Franz Xavier von, a German mystic, born in Munich, March 27, 1765, died there, May 23, 1841. After extensive studies he was appointed by the Bavarian government inspector general of mines, and in 1826 he became professor of philosophy and speculative theology at the newly established university of Munich. He was a devoted follower of Böhme, whose mysticism predominated in his philosophical theories and in his devout interpretation of Roman Catholic theology. He wrote on the natural sciences and technology, but his principal writings are metaphysical. In his *Fermenta Cognitionis* he extols Böhme as the greatest of thinkers. His chief disciple, Franz Hoffmann of Würzburg, has endeavored to reduce Baader's mystic aphorisms to a system, and has edited his complete philosophical works (16 vols., Leipsic, 1850-'60).

BAAL, a Semitic word signifying owner, lord, or master, and in the highest sense denoting the deity. The Hebrews never used it as a designation of their deity, but always to distinguish some god of the surrounding nations. In this sense, with some adjunct appended, it indicated several local deities: Baal-zebul was the fly god of the Ekronites, corresponding to the *Ζεύς ἀπόμυιος* of the Greeks; Baal-peor an-

swered to the Roman Priapus; Baal-berith, Covenant Baal, to *Zēdē dōkios* and *deus fidi-* us of the Greeks and Romans. With the

article prefixed, it designated the Baal or chief deity of the Phœnicians. Strictly Baal meant the highest male god (the sun or the planet Jupiter), as Ashtoreth or As-tarte did the highest goddess (the moon or Venus), divinities from whom all things visible and invisible had their origin. The Greeks

Baal.

and Romans, however, sought and found analogies between the several Baals and some of their subordinate deities, as Mars and Hercules. The Bel or Bil of the Babylonians is closely related to the Baal of the Phœnicians, the former name being a contraction of

the latter, or this a guttural extension of the former. Baal, Bal, and Bel, as prefixes or suffixes, enter largely into many proper names of places and persons. Such are Baal-zephon, Baal-gad, Baal-hamon, Jerub-baal, Esh-baal, Bal-adan, and Bel-shazzar. The Phœnicians carried the word through all their wanderings, giving us the Carthaginian Asdru-bal, Adher-bal, and Hanni-bal. They carried the name to Ireland, where we read of Beal or Bal, the ancient deity worshipped by Bal fires on the summits of the hills, and of Bel's cairns, where sacrifices were offered to Baal. The Greek *Bēlos* and the Latin *Belus* are merely the Babylonian Bel with a terminal syllable, though the Greeks invented for him a descent of their own. Whenever the Israelites fell into idolatry, their natural tendency was to worship Baal, the god of the nations with whom they came into most immediate contact.

BAALBEK (in Phœnician, Baal of the valley, but rendered by the Greeks *Heliopolis*, city of the sun), an ancient city of Syria, in lat. $34^{\circ} 1'$ N., lon. $36^{\circ} 11'$ E., 86 m. N. by W. of Damascus, the ruins of which are the most imposing in the country, excepting those of Palmyra. The city lay in a plain of Cœle-Syria, fertil-

Ruins of Baalbek.

ized by streams rising in the range of Anti-Libanus. The date of its foundation is uncertain, the tradition which ascribes its erection to Solomon being wholly unsupported. It is mentioned under the name of Heliopolis by Josephus and Pliny. Lying in the direct route of trade between Tyre and the East, it rose to considerable importance, and was embellished with magnificent temples, the finest of which appear to date from the time of Antoninus Pius, A. D. 160, who built or enlarged the great temple, which was then considered one of

the wonders of the world. When Christianity became the religion of the Roman empire, the heathen temples, except the great one, which was made a Christian church, were suffered to decay; but as late as the time of the Moslem invasion (635) Baalbek was the most splendid city of Syria, adorned with monuments of ancient times and abounding in luxury. It made a stout defence against the Moslem invaders, who imposed upon it a heavy ransom. For more than a century it continued an opulent mart, but was finally sacked in 748 by the caliph of

Damascus, the principal inhabitants being put to the sword. During the crusades it changed hands repeatedly. It was sacked by Tamerlane in 1400, and subsequently taken by the Metaweli, a barbarous nomad tribe, who were nearly exterminated by the Turks. In 1759 an earthquake completed its devastation.—The most promi-

of steps which led up to it have also disappeared. The great portal, 17 ft. in width, leads into a hexagonal court about 200 ft. in diameter, in a ruinous condition; on its western side another portal, 50 ft. wide, brings one to a quadrangular court, 440 ft. in length by 370 in breadth. Around the sides of this court are numerous exedrae, with columns in front, 30 ft. deep, and elaborately ornamented with carvings. The peristyle, 290 ft. in length by 160 in breadth, fronts upon the quadrangle; its columns, originally 54 in number, are about 76 ft. in height and over 7 in diameter, usually consisting of three blocks only. This magnificent edifice, of which only six columns now remain standing, was elevated some 50 ft. above the surrounding country, upon a platform, the western side of which contains three immense stones, whose united length is 190 ft., the largest being 64 ft. long, their average height 13 ft., their thickness still greater. The lesser temple, which like the other is of Corinthian architecture, stands upon a lower platform, a little to the south of the peristyle of its greater neighbor; its length, including the colonnades, was 225 ft., and its breadth 120. Its peristyle consisted of 44 columns, 45 ft. in height, of which only 19 remain standing. Some 80 rods distant stands a small circular temple, elaborately ornamented. The material used in the construction of the temples is a compact limestone, quarried in the hills south of the town. The ruins of Baalbek are apparently of two or three distinct eras. The huge stones which form the platform are of Cyclopean architecture. The Roman temples, which appear to occupy the site of an older structure, present some of the finest models of the Corinthian architecture. The modern village of Baalbek is little more than a heap of rubbish, the houses being built of mud and sun-dried brick. The population is about 2,000.

BAAN, Jan van, a Dutch painter, born in Haarlem, Feb. 20, 1633, died at the Hague in 1702. He confined himself almost exclusively to portraiture, and was an imitator of Vandyke, to whom he was little inferior in color and expression. He painted portraits of the most eminent men of his own country, and of Charles II. of England and many of his court. He declined an invitation of Louis XIV. to visit Paris, on the ground that it would be unbecoming in him to trace the features of the despoiler and conqueror of his country.

BABADAGH, a fortified town of European Turkey, capital of the Dobrudja, or N. E. Bulgaria, in the eyalet and 96 m. N. E. of the city of Silistria, near Lake Rassein, which is connected with the mouths of the Danube and the Black sea; pop. about 10,000. Near the entrance of the lake is the seaport of Kara Irman, through which Babadagh carries on an extensive trade. The town lies in an unhealthy situation between mountains and swamps. It is called after Baba the saint, whose adjoining tomb attracts Moslem pilgrims. It contains

Temple of Jupiter, Baalbek.

nent objects visible from the plain are a lofty portico of six columns and part of the walls of the great temple, and the walls and columns of a smaller temple a little below. The greater temple stood upon an artificial platform, between 20 and 30 ft. in height, and extended

Piece of Ceiling (fallen) in Temple of Jupiter, Baalbek.

1,000 ft. from east to west. It is probable that it was never completed. Approaching from the east, one entered a magnificent portico, 180 ft. in length and 37 in depth. Only the pedestals of the columns now remain; the vast flight

five mosques, a college, and an aqueduct, and was of great strategical importance in the Turko-Russian conflicts of the 18th century and in the Crimean war, when the forts were ineffectually bombarded by the Russians (March 27, 1854).

BABBAGE, Charles, an English mathematician, born at Teignmouth, Dec. 26, 1792, died in London, Oct. 20, 1871. He was a fellow student of Sir John Herschel at the university of Cambridge, and was Lucasian professor there from 1828 to 1839. He became celebrated as the inventor of the calculating machine. (See CALCULATING MACHINES.) He was one of the founders of the royal astronomical society and of the British association, and the originator of the statistical society, and wrote extensively for scientific and philosophical periodicals on mathematics, magnetic and electric phenomena, mechanical science, geology, and statistics. Among his works are: "Letter to Sir Humphry Davy on the Application of Machinery to Mathematical Tables" (1822); translations, with Herschel and Peacock, of Lacroix's works on the differential and integral calculus; "Comparative View of the different Institutions for the Assurance of Life" (1826); "A Table of the Logarithms of the Natural Numbers from 1 to 108,000" (1826); "Reflections on the Decline of Science in England" (1830); "Economy of Manufactures and Machinery" (1832), which passed through many English editions and foreign translations, and has been called by Blanqui a hymn in honor of machinery; "A Ninth Bridgewater Treatise" (1837), defending mathematical studies from the charge of a tendency to infidelity; "The Great Exposition" (1851); and "Passages from the Life of a Philosopher" (1864). His house in London was for many years a centre of intellectual society.

BABCOCK, Rufus, D. D., an American clergyman, born at North Colebrook, Conn., Sept. 18, 1798. He graduated at Brown university in 1821, and was for two years tutor in Columbian college, D. C. In 1823 he was ordained pastor of the Baptist church at Poughkeepsie, N. Y.; in 1826 he became pastor in Salem, Mass.; and in 1833 he was elected president of Waterville college, Maine; but his health failing, he resigned in 1836, and accepted the pastorate of the Spruce street Baptist church in Philadelphia, whence he returned after three years to his first charge at Poughkeepsie. He was subsequently pastor of a church in Paterson, N. J., and has held successively the offices of secretary of the American and foreign Bible society, of the American Sunday school union, and of the Pennsylvania colonization society. He edited for five years the "Baptist Memorial," and has published a "Memoir of Andrew Fuller" (1830), "History of Waterville College" (1836), "Tales of Truth for the Young" (1837), "The Emigrant's Mother" (1859), "Memoirs of John M. Peck" (1862), &c.

BABEL, the Hebrew name for Babylon and the Babylonian empire. In the language of

the Chaldeans it was probably *Bab-Il*, the "gate of (the highest) God;" but the Hebrew form is explained by *balal* (or *bilbel*), to confound, in allusion to the confounding of tongues consequent on the building of the tower of Babel. This tower was probably never carried to any great elevation, but a sacredness may have been attached to the spot on which it was to be built; and there, long after, was erected the pyramidal temple of Bel-Merodach, finally repaired by Nebuchadnezzar, the ruins of which, at Borsippa, are now known as Birs Nimrud (citadel of Nimrod). Except in one passage (Gen. xi. 9), there is no reference in Scripture to the tower of Babel; but we are told of a temple of Bel in which Nebuchadnezzar placed the spoils of Jerusalem, and probably those of his other conquests. Herodotus describes a temple of Belus, which according to him consisted of a "solid tower of a stadium in depth and width; upon this tower another is raised, and another upon that, to the number of eight towers." This general description tallies so closely with the mound of Birs Nimrud as to render it probable that this is the remains of the temple of Belus. The ruin presents the aspect of a huge irregular mound, rising abruptly from a wide desert plain, with masses of vitrified matter lying around its base. Its interior is found upon excavation to be composed of a mass of brick partially vitrified by fire, showing that it is the ruin of a structure into which combustible material largely entered. The bricks disinterred from the mound bear inscriptions in the cuneiform character, in most of which the name of Nebuchadnezzar appears. One of the inscriptions of this monarch reads: "A former king had built it (they reckon 42 ages); but he did not complete its head. Since a remote time the people had abandoned it, without order expressing their words. Since that time the earthquake and the thunder had dispersed its sun-dried clay. The bricks of the casing had been split, and the earth of the interior had been scattered in heaps." Attempts have been made to represent this temple of Belus, as restored and rebuilt by Nebuchadnezzar. That which appears most probable is by Sir Henry Rawlinson. He says: "Upon a platform of crude brick, raised a few feet above the alluvial plain, was built of burnt brick the first or basement stage, an exact square, 272 ft. each way, and 26 ft. in perpendicular height. Upon this stage was erected a second, 230 ft. each way, and likewise 26 ft. in perpendicular height, which, however, was not placed exactly in the middle of the first, but considerably nearer to the southwestern end, which constituted the back of the building. The other stages were arranged similarly, the third being 188 ft. square and 26 ft. high; the fourth, 146 ft. square and 15 ft. high; the fifth, 104 ft. square, of the same height as the fourth; the sixth, 62 ft. square, and again the same height; the seventh, 20 ft. square, and once more the

same height. On the seventh stage was probably placed the ark or tabernacle, which seems to have been again 15 ft. high, and must have nearly, if not entirely, covered the top of the seventh story. The entire original height, allowing three feet for the platform, would thus have been 156 ft., or without the platform 153 ft. The whole formed a sort of oblique pyramid, the gentler slope facing the N. E., and the steeper inclining to the S. W. On the N. E. side was the grand entrance, and here stood the vestibule, a separate building, the débris from which, having joined those from the temple itself, fill up the intermediate space, and remarkably prolong the mound in this direction." The several stories of this temple appear to have been painted in several colors: the lowest black, representing Saturn; then, in order, Jupiter, orange; Mars, red; the Sun, golden; Venus, yellow; Mercury, blue; the moon, silver. Above these was the shrine, in which, according to Herodotus, was a golden table, and a bed well furnished, but no image. Within the shrine, he adds, "no one remains over night, except a native female, one whom the god has chosen in preference to all others, as say the Chaldeans, who are priests of that god. These persons also say, asserting what I do not believe, that the god himself frequents the temple, and reposes on the couch." The purposes to which this temple became devoted from age to age may be gathered from the foregoing. Consecrated, perhaps, at first to the ambition of a monotheistic faith, it passed through several stages of Sabianism or worship of the host of heaven, until the rites performed in it sank into the gross idolatry of later times, and it was polluted by the vices which grow out of heathen superstition, as intimated by Herodotus. In one respect this temple, or rather series of temples built on the same spot, subserved a valuable purpose. The Babylonians were given to the study of astronomy; the temple served also as an observatory, from which the movements of the heavenly bodies could be watched. Assuming, which is probable, that the mound of Birs Nimrud represents the most important structure in ancient Babylon, it enables us to correct, at least approximately, the statements of the later historians as to the height of the walls which surrounded the city. This temple was at most only 156 ft. high, while we are told that the city walls were 300 or 350 ft., with towers having a height of 420 ft. These walls would therefore be nearly as high as the dome of St. Paul's, London (365 ft.), and the towers almost as high as the cross which surmounts the dome of St. Peter's at Rome (430 ft.). Of all human structures the apex of the greatest Egyptian pyramid (480 ft.) is the only one which greatly exceeds that ascribed to the brick towers of Babylon. The only other ruins which have in any way been proposed to be identified with the ancient Babel, are those now denominated El-Kasr and Babil, on the opposite side of the Euphrates, at a dis-

tance of about 12 m. from Birs Nimrud. (See **BABYLON**.)

BAB-EL-MANDEB (Arabic, "the gate of mourning," referring to the dangerous navigation), a strait uniting the Indian ocean (gulf of Aden) with the Red sea, separating Asia from Africa, and situated between the shores of Samhara and Arabia. The distance across, from the projecting cape Bab-el-Mandeb (anc. *Palindromus*) on the Arabian shore to the opposite coast of Africa, is about 18 m., the island of Perim and other smaller islands lying in the intermediate space, and dividing the strait into a western channel with a depth of 180 fathoms and an eastern one from 7 to 14 fathoms deep. The latter is most practicable for navigation. Perim, commanding the straits, has been in British possession since 1857; a fort has been built at Straits point, and a revolving light was erected in 1861.

BABER, *Zahir ed-Din Mohammed*, Mogul emperor, born in 1482 or 1483, died in December, 1530. He was a descendant of Tamerlane, his father being sultan of Khokan, a Tartar kingdom on the Jaxartes. On his father's death, which happened when he was 11 or 12 years old, the kingdom was seized by his uncle, the sultan of Samarcand, but Baber succeeded in maintaining his rights. Baber's early life was a succession of wars with his neighbors. He was obliged to fly, and went to Khorasan with 800 followers, where he sought assistance from the sultan, which was refused. A number of Mongols joined his standard, and Baber marched on Cabool in Afghanistan, which he captured in 1504. The following year he made an irruption into the Punjab, but did not cross the Indus, and returned to Cabool. He became involved in dissensions in Khorasan in 1506, and for many years was occupied with attempts to recover his paternal possessions. In 1519 he again descended into Hindostan, crossed the Indus, and conquered some towns in the Punjab. In 1524 he advanced to Lahore, which he captured and burned. The next year he advanced to Paniput, about 50 miles from Delhi. Here he encountered the troops of Sultan Ibrahim Lodi, the Afghan sovereign of Delhi, and completely vanquished him, April 27, 1526. Baber's lieutenants occupied Delhi and Agra, while his son Humayun routed another Afghan army, and Baber himself marched south against the Hindoos, and gained a victory over Rana Sanka, the most powerful of their princes. From this time Baber occupied himself in consolidating his extensive dominions. He made roads with stations for travellers; directed the land to be measured with a view to equitable taxation; planted gardens and introduced fruit trees; and established a line of post houses from Agra to Cabool. To great political and military talents Baber joined literary tastes and accomplishments. He wrote a history of his own life in the Mongol language, which has been translated. He founded a dynasty in India which lasted almost three centuries, and

embraced among its members Akbar and Aurungzebe. He was succeeded by Humayun, the oldest of his three sons.

BABEUF, or **Babeuf**, **François Noël**, a French revolutionist, born in St. Quentin in 1764, executed at Vendôme, May 27, 1797. He began life as a surveyor's assistant. In his youth he was arrested on account of his subversive theories, and was also imprisoned on a charge of forgery, of which he was acquitted. He professed the fullest sympathy with the revolution in 1792, obtained several public offices, and in 1794 established, under the name of Caius Gracchus Babeuf, a journal called *Le tribun du peuple*, urging the most extreme socialistic action. His followers were called Babouvistes. In March, 1796, he organized a conspiracy for the overthrow of the authorities and the constitution, and for carrying his theories into practice by an equal distribution of property. Being betrayed in May, Babeuf and his principal adherents were arrested, and were tried at Vendôme in the following year. Babeuf and Darthé were sentenced to death, and attempted to commit suicide, but were still alive when carried to the scaffold. Of their accomplices 56 were acquitted, and 7 transported, including Buonarrotti, who afterward published *Conspiration pour l'égalité dits de Babeuf*, with an account of the trial (2 vols., Brussels, 1828). Among Babeuf's works are: *Cadastré perpétuel* (Paris, 1789), and *Du système de dépopulation, ou la vie et les crimes de Carrier* (1794). Éd. Fleury refuted his theories in *Babeuf et le socialisme en 1796* (Paris, 1851).

BABINET, **Jacques**, a French physicist, born at Lusignan, March 5, 1794, died in October, 1872. He was educated at the polytechnic school, taught mathematics, physics, and meteorology, and became a member of the academy and an astronomer in the bureau of longitudes at the Paris observatory. His scientific lectures, celebrated for their attractive style, were familiarly known in Paris as the *causeries du père Babinet*. He wrote in the annals of the academy and other periodicals on meteorological and mineralogical optics, terrestrial magnetism, the theory of heat, and the measure of chemical forces, and made important improvements in pneumatic machines, in hygrometers, atmometers, goniometers, and in geographical maps (*cartes homalographiques*); but his unfortunate predictions in regard to the failure of the Atlantic cable and to various meteorological phenomena have been much ridiculed. Among his works is *Études et lectures sur les sciences d'observation et sur leurs applications pratiques* (2 vols., Paris, 1855).

BABINGTON, **Anthony**, an English conspirator, born at Dethick house, Derbyshire, about 1566, executed in London, Sept. 30, 1586. He belonged to the Roman Catholic branch of an ancient and opulent family, and when hardly 20 years of age became the leader of a band of young Catholics who were fired with enthu-

siasm for their faith and for the rescue of Mary Stuart, then a prisoner near the Babington estates. Betrayed by one of their companions, Babington and his 18 accomplices were arrested and executed. On the day before his execution he wrote to Elizabeth, whose murder was a part of the plot, confessing his guilt and imploring pardon. The execution of Mary was hastened by her correspondence with Babington.

BABINGTON, **William**, an English physician, born at Portglenone, in the N. of Ireland, in June, 1756, died in London, May 29, 1833. He was early connected with Guy's hospital as an apothecary and lecturer on chemistry, and after 1797 became physician in that institution, and had an extensive medical practice in London. He laid the foundation of the geological society, and became its vice president and afterward president, making liberal donations to the museum and library. Having purchased the earl of Bute's fine mineralogical collection, he published "A Systematic Arrangement of Minerals" (London, 1795), and "A New System of Mineralogy" (1799). Among his other works was a "Syllabus of the Course of Chemical Lectures" (1802). His son-in-law, Richard Bright, M. D., published "Memoirs of the Life and Writings of William Babington, M. D."

BABISM, the doctrines of a Mohammedan sect which originated in Persia about 1843. Its founder appears to have been Mirza Ali Mohammed, a native of Shiraz, who, after making a pilgrimage to Mecca, undertook to form a new religion from a mixture of Mohammedan, Christian, Jewish, and Parsee elements. He took the name of Bab-ed-Din, "the gate of the faith," which he afterward abandoned, calling himself the "Point," or creator of the truth, claiming to be not merely a prophet, but a personal manifestation of the Divinity, while the title of Bab was conferred upon one of his followers. He sent out missionaries in various directions, the most celebrated of whom was a young woman, known in the sect as Gurret-ul-Ayn, or "Consolation of the Eyes." She was the daughter of Hadji Mullah, a distinguished jurist, and is said to have been remarkable for her personal beauty and intelligence. She set the example of appearing in public unveiled, and after preaching against polygamy and other Mohammedan practices, she finally left her husband and family, and devoted herself to the propagation of the new religion. Her purity of character was never questioned by either party. The adherents of the Bab soon became numerous. The late shah did not molest them, but on the accession of Nasir-ed-Din in 1848, apprehending a persecution, they took up arms, announcing the advent of the Bab as universal sovereign. Two large armies sent against them were routed, but the insurrection was at last crushed, and the Bab, who had held aloof from the revolt, was arrested. After 18 months' imprisonment he was put to death with one

of his disciples in 1850. This gave a new impetus to his doctrines. At an assembly of the leaders in Teheran a young man of 16, Mirza Gahara, son of the governor of the city, was recognized as Bab and took the name of "Eternal Highness." He ordered his followers not to take up arms again until he should give the signal. An attempt of three Babists, however, to assassinate the shah in 1852 led to a new persecution. Numbers of the believers were simultaneously executed at Teheran with horrible tortures, and among the victims was Gurret-ul-Ayn. She was treated at first with respect, being of noble rank, but finally, after being forcibly veiled, was sentenced to be burned alive. The executioner, however, smothered her before setting fire to the pile. The Bab himself was not captured. Since that time the Babists, as a secret sect, are supposed to have made great progress in Persia, India, and a part of Turkey.—The Babist doctrine asserts the unity of the Godhead, but upon this it engrafts many of the doctrines of the Gnostics and Brahmins. All beings are emanations from the Deity, and all will at the day of judgment be reabsorbed into the divine personality. The Bab has not revealed the whole truth, but will be followed by a successor who will complete the revelation. The Bab is superior to Mohammed, as Mohammed was superior to Jesus. The number 19 is sacred, for the original unity of the Deity consisted of 19 persons, of whom the Bab was the chief. At the death of a prophet or saint, his soul does not quit the earth, but joins itself to some other soul still in the flesh, who carries on his work. Babism enjoins few prayers, and only upon fixed occasions. Women are to discard veils, and share in the intercourse of social life. Concubinage and divorce are forbidden, and polygamy is discountenanced, though not absolutely prohibited.—See *Les religions et philosophies dans l'Asie centrale* (Paris, 1866), by Gobineau, who gives a translation of "The Book of Precepts," the sacred book of the Babists.

BABO, Franz Maria von, a German dramatist, born at Ehrenbreitstein, Jan. 14, 1756, died in Munich, Feb. 5, 1822. His *Otto von Wittelsbach* is, next to Goethe's *Goetz von Berlichingen*, the best German historical tragedy. His dramas have been collected in two volumes. (Berlin, 1798-1804.)

BABOON, a division of the monkeys of the old world, belonging to the genus *cynocephalus* of Cuvier. This genus is characterized by the position of the nostrils at the very end of the muzzle, which is lengthened and truncated; the teeth are 32 in number, as in man, but the canines are remarkably strong, and the last lower molar has a fifth point; the ridges over the eyes are very distinct, and the occipital crest for the origin of the powerful muscles of the skull and jaws is as large in proportion as in the true carnivora; the face is lengthened, giving the appearance of that of a dog, whence the generic name, and in the adult is marked

with longitudinal furrows. All the species have cheek pouches and callosities. The baboons are among the largest of the quadrumana, and their strength is enormous; their disposition is fierce and malignant, and their habits are of the most disgusting character; they hardly possess a good quality, and are almost always rebellious in confinement and dangerous when at liberty. Their dispositions are exceedingly fickle, and they pass on the slightest provocation from a pleased condition into a paroxysm of rage. In a wild state they are very cunning, and when attacked are most dangerous enemies. When trained from their youth, they exhibit a considerable degree of docility; but they can never be trusted. They are semi-terrestrial; from the nearly equal length of the fore and hind limbs, they run well on the ground, and are also excellent climbers; their anterior extremities are remarkably powerful. Their food is principally vegetable, consisting of fruits, roots, the tender twigs of plants, and occasionally eggs and young birds; in a state of captivity they will eat almost anything. In some species the colors are bright, and the fur long and fine, forming a kind of mane on the upper parts. They are generally divided into two groups: the baboons proper, with long tails, the genus *cynocephalus* of Cuvier; and the mandrills, with short tails, of which Brisson has made the genus *papio*. There are six

Chacma (*Cynocephalus porcellus*).

well marked species of the former group: 1. The chacma, or pig-faced baboon (*C. porcellus*, Desm.), is a native of Africa, in the neighborhood of the Cape of Good Hope. The color is greenish or grayish black above, palest on the flanks and fore part of the shoulders; the hair on the neck of the male adult is long, like a mane, whence Geoffroy St. Hilaire's specific name of *somatus*; the face and extremities are violet black, paler round the eyes; the upper eyelids are nearly white; the tail is long and

tufted. This animal is exceedingly ferocious, even when brought up from youth in captivity; in its native haunts it hunts greedily after

adult, in this as in all the other species. This animal is of large size, and very fierce. 4. The little baboon (*C. babuin*, F. Cuvier) is supposed by its describer to be one of the quadrumana adored by the Egyptians, and frequently seen among their hieroglyphics, and is probably the *simia cynocephalus* of Linnaeus. It inhabits northern Africa. The color of the male is a uniform yellowish green above, paler beneath; the face is livid; the nasal cartilage is not longer than the upper jaw; the tail, though raised at its origin, is of considerable length, reaching below the hams. 5. The ribbed-nose baboon (*C. mormon*, Desm., or *C. maimon*, Linn.) is a native of the Guinea coast, and is not uncommon in menageries. This and the next species, forming the genus *papio* of Brisson, have the tail very short (almost a tubercle), very large ischiatic callosities, a more elongated muzzle armed with formidable teeth and a greater size than any other

Dog-faced Baboon (*Cynocephalus hamadryas*).

scorpions, which it devours alive in great quantities, having first, with exceeding quickness, broken off the end of the tail containing the sting. 2. The dog-faced baboon (*C. hamadryas*, Linn.), an allied species, inhabits Africa and the borders of the Persian gulf of Arabia. The color is blackish gray, tinged with brown; the hair on the fore parts is very long and shaggy; the face is flesh-colored; the females and young have short muzzles, of a bluish color. It is equally fierce and dangerous with the preceding, of which by some authors it is considered a variety. 3. The Guinea baboon (*C. papio*, Desm.) inhabits the coast of Guinea. The color is brown above, paler beneath; the cheeks are yellowish; the face, ears, and hands

Mandrill (*Cynocephalus mormon*).

species, and the most fierce and disgusting characters of the baboon tribe. In *C. mormon* the colors of the adult are rich, and their effect is increased by the blue, red, and purplish tints of the face, nose, and naked parts of the skin; in the young the fur is of a uniform tawny green, paler beneath, and yellowish on the cheeks; in the adult male the color is olive-brown, mixed with gray above and white beneath, with a yellow beard, and the furrowed muzzle of a livid blue, with a bright red nose and dull flesh-colored lips; in the young the furrows do not appear, and the tints of the naked parts, as in the females, are less vivid. The species is usually called the mandrill. It recedes much in form from the typical quadrumana, and approaches the carnivora in its structure, instincts, and appetites; it has been known to tear to pieces and devour living prey with the ferocity of a tiger. 6. The drill (*C. leucophaeus*, F. Cuv.), also a native of Africa, is

Little Baboon (*Cynocephalus babuin*).

are black; the nasal cartilage exceeds the jaws in length; the upper eyelids are white. In the young the muzzle is shorter than in the

nearly as fierce and powerful as the mandrill. The color above is greenish brown, tinged with gray, beneath white; the face is a uniform

brown baboon, having, when full grown, a very remarkable shaggy mane around his neck and shoulders. About the paws the hair is nearly black. The young gelada is entirely destitute of the hairy mane, and is much lighter in color than the adult animal.

BABYLON (Gr. *Babylōn*, Heb. *Babel*), an ancient city in what is now Turkey in Asia, in lat. $32^{\circ} 39' N.$, lon. $44^{\circ} 30' E.$, lying on both banks of the Euphrates, or rather, perhaps, of a broad bayou flowing eastward of the main channel, which formerly ran five or six miles to the west of its present course, close under the walls of Borsippa, the site of the mound of Birs Nimrud, identified as the ancient Babel, about 800 miles above the junction of the Euphrates with the Tigris, near the modern village of Hilleh. According to this view it stood on the E. bank of the Euphrates proper, and at such distance from it as to be above reach of its inundation; but the bayou itself, flowing directly through the city, lined with quays, and bordered by great buildings, came to be regarded as the main river. (For the origin and import of the name, see **BABEL**; for the general history of the city, see **ASSYRIA**, **BABYLONIA**, and **CHALDEA**.) Babylon owed its chief greatness to Nebuchadnezzar, who describes it as "the great Babylon that I have built for the house of the kingdom of my power, and for the honor of my majesty." Herodotus, who saw it about 100 years after the death of that monarch, describes it thus: "The city stands on a broad plain, and is an exact square 120 stadia in length each way, so that the entire circuit is 480 stadia. It is surrounded by a broad and deep moat, full of water, behind which rises a wall 50 royal cubits in width and 200 in height (the royal cubit is longer by three fingers' breadth than the common cubit). . . . On the top, along the edges of the wall, they constructed buildings of a single chamber facing one another, leaving between them room for a four-horse chariot to turn. In the circuit of the wall are a hundred gates, all of brass, with brazen lintels and side posts." As 120 stadia are equal to 14 miles, the walls would measure 56 miles, enclosing an area of 196 sq. m. Other writers reduce the circuit of the walls by a fourth, making it 360 stadia. As we learn that within the walls were included gardens and pasture grounds, it is not beyond belief that their circuit may have been as great as represented. But the height given for the walls seems incredible. It is agreed that the royal cubit was equal to 22.4 inches. The height of the walls would then have been 373 ft. 4 in., thickness 93 ft. 4 in. For all purposes of defence a wall of 60 feet is as good as one of any greater height. Strabo and the historians of Alexander reduce the 200 cubits to 50, which has led some to suspect that Herodotus wrote palms instead of cubits. "My own belief," says Sir Henry Rawlinson, "is that the height of the walls of Babylon did not exceed 60 or 70 feet."

Drill (*Cynocephalus leucophaeus*).

dull black, and the muzzle has no furrows; the under lip is red. The females are smaller in size, and of a duller color.—Other baboons are described, but not with sufficient exactness and authority to admit of a general recognition. Some species of the genus *macacus*, inhabiting India and its archipelago, have been incorrectly called baboons; among these may be mentioned *M. silenus*, Geoff.; *M. rhesus*, Geoff.; *M. nemestrinus*, Geoff.; and *M. niger*, Desm. These, with others, are intermediate between the guenons and the baboons, and in some respects resemble the true *cynocephali*.—A peculiar species has recently been intro-

Gelada (G. Ruppelli).

duced to the notice of naturalists by Dr. Ruppell in his work on the fauna of Abyssinia. This is the gelada (*gelada Ruppellii*), a large

Herodotus adds that there was an inner wall of less thickness than the first, but very little inferior to it in strength. Of the circuit

The Kasr.

of this inner wall we are not informed. M. Oppert believes that he has found traces of both walls, and in the plan which he gives it is represented as running parallel to the outer one at a distance of about a mile. Others believe that this was the wall of Nebuchadnezzar's new city, or rather citadel, which had a circuit of five miles. Herodotus also says that "the centre of each division of the town was occupied by the fortress, in one of which stood the palace of the kings, surrounded by a wall of great strength." The ruins of this have been found in one of the three great existing mounds, known as the Kasr. In the other division was "the sacred precinct of Jupiter Belus, a square enclosure of two stadia each way, with gates of solid brass." This has been identified as the ruins now called Babil, a mass of unburned brick rising to the height of 140 feet, which may have been about the height of the original wall. The accounts of different writers may be thus summed up: The Euphrates traversed the city from north to south. From each of the 25 gates on each side ran

Babil, from the West.

a broad street to the opposite gate, dividing the city into 625 squares, each about $2\frac{1}{2}$ miles in circumference. The river bank on each side

was guarded by a wall with gateways at the foot of each street, and steps leading down to the river. The usual means of crossing was by boats; but a single bridge was thrown over. This consisted of stone piers sunk in the bed of the stream, connected by wooden platforms which were removed at night. It is said, but apparently on no good authority, that there was also a tunnel under the bed of the river. The famous hanging gardens do not seem to have attracted the attention of Herodotus. According to other writers, they were built by Nebuchadnezzar to gratify his wife Amyitis, a native of Media, who longed for something in this flat country to remind her of her mountain home. They consisted of an artificial mountain 400 ft. on each side, rising by successive terraces to a height which overtopped the walls of the city. The terraces themselves were formed of a succession of piers, the tops of which were covered by flat stones 16 ft. long and 4 ft. wide. Upon these were spread beds of matting, then a thick layer of bitumen, covered with sheets of lead. Upon this solid pavement earth was heaped, some of the piles being hollow, so as to afford depth for the roots of the largest trees. Water was drawn from the river to irrigate these gardens, which thus presented to the eye the appearance of a mountain clothed in verdure. Herodotus speaks of writing a special work on the history of Assyria. If this was ever written, it is not now extant. He makes in his general history only a passing reference to the "many sovereigns who had ruled over Babylon, and lent their aid to the building of its walls and the adornment of its temples." He does not even refer to Nebuchadnezzar, whose name was stamped upon the bricks of every important structure. He mentions two queens as having a great share in them. These are Semiramis and Nitocris, of whom the former is a legendary character (See ASSYRIA.) Nitocris seems to have been the daughter of Nebuchadnezzar, and mother of Nabonadius. (See BABYLONIA.) Herodotus affirms that this queen changed the course of the river above Babylon from a straight to a winding course, so that it came several times in view of the village of Ardericca, and a person sailing down the river had to pass three times in as many days in sight of the same spot. Sir Henry Rawlinson says that no such cutting ever could have existed; an assertion corroborated by all attempts which have been made to permanently change the course of a great river flowing through an alluvial region. She also dug an immense reservoir 420 stadia in circuit, facing the interior walls with stone. Into this she turned the river, leaving its bed dry at Babylon, so that she could lay there the piers for the bridge. All this was done to shut out the Medes from intercourse with Babylonia. If such an excavation had existed, it is hardly possible that traces of it should not now remain. In a region where for 100 miles not a pebble is

to be found, it is difficult to conceive whence these stones could be brought; and if once brought, it is equally difficult to imagine whither they have been carried. They are not there now, and are not to be found among the ruins of Seleucia or Ctesiphon, built from the fragments of Babylon. A careful comparison of existing facts with the relations of the writers from whom the accounts of Babylon have been drawn will evince that these accounts are greatly exaggerated. Still, there can be no doubt that Babylon as built by Nebuchadnezzar and captured by Cyrus was one of the great cities of the world, though of necessity built mainly of perishable materials. The description given by the great king in his "standard inscription" appears to tell the true story. We quote with abridgments a few passages: "The double enclosure which Nabopolassar, my father, had made, but not completed, I finished. Nabopolassar made its ditch. With two long embankments of brick and mortar he bound its bed. He lined the other side of the Euphrates with brick. He made a bridge over the Euphrates, but did not finish its buttresses. With bricks, burnt as hard as stones, he made a way for the branch of the Shimat to the waters of the Yapur-Shapu, great reservoir of Babylon. I finished the great double wall. With two long embankments of brick and mortar I built the side of its ditch. I strengthened the city. Across the river, to the west, I built the walls of Babylon with brick. The reservoir I filled completely with water. Besides the outer wall, the impregnable fortification, I constructed inside of Babylon a fortification such as no king had ever made before me, namely, a long rampart 4,000 *ammes* (5 miles) square, as an extra defence. Against presumptuous enemies, great waters I made use of abundantly. Their depths were like the depths of the vast ocean. I did not allow the waters to overflow; but the fullness of their floods I caused to flow on, restraining them with a brick embankment. Thus I completely made strong the defences of Babylon. May it stand forever." He describes another structure: "Inside the brick fortifications I made another great fortification of long stones of the size of great mountains. And this building I raised for a wonder; for the defence of the people I constructed it." This is the only case in which stone is mentioned. Not improbably this was the structure spoken of as the hanging gardens. He describes his palace called *Tapratinisi*, "the wonder of the world," which had also been begun by his father. He tells how it used to be flooded by the inundations of the river, and how he raised the platform of brick upon which it stood; and goes on: "I cut off the floods of the water, and the foundations (of the palace) I protected against the water with bricks and mortar. I finished it completely. Long beams I set up to support it. With pillars and beams plated with copper and strengthened with iron I built up its gates. Silver, and gold, and precious

stones, whose names were almost unknown, I stored inside, and placed there the treasure-house of my kingdom." Here again there is nothing but brick and mortar and wooden beams; the gates of the palace itself, which Herodotus saw and supposed to be of solid brass, were of wood plated with copper and strengthened with iron. The shapeless Kasr affords no means for testing the accuracy of the description given by Nebuchadnezzar of his palace; but there is a ruin which in a measure affords such a test. This is Birs Nimrud. (See BABEL.) The height of this mound, crowned by a tower, was 153 ft., and as it was beyond doubt among the loftiest of the Babylonian structures, we are enabled to rectify the extravagant heights attributed to the city walls.—

Birs Nimrud.

Babylon, at least in its later period, after it had sprung up to be the capital of a great empire, was noted for the luxury and depravity of its inhabitants. "Nothing," says Q. Curtius, "could be more corrupt than its morals, nothing more fitted to excite and allure to immoderate pleasures. The rites of hospitality were polluted by the most shameless lusts." Once at least in her life every woman was obliged to prostitute herself in the temple of Belus. Of the population of Babylon there exists no ground for even probable estimate. As a centre of empire and commerce, its population would be limited only by the capacity for subsistence of the fertile region from which its supplies were drawn. Considering its vast extent, but bearing in mind that only a small portion, probably not more than a tenth, was built over, 1,500,000 is not an improbable conjecture.—The site of the ancient Babel was probably at Borsippa (Birs Nimrud), a little below the later Babylon, and on the opposite side of the main Euphrates. Borsippa was a suburb with separate fortifications, for Nabonadins, after being defeated in the field by Cyrus, threw himself into it, leaving Babylon proper in the charge of his son Belshazzar. For an unknown period Babylon was a town of minor importance, the successive capitals of the Chaldean kingdom lying lower down the plain. Babylon first comes prominently into notice about the time of the

foundation of the dynasty of Nabonassar (747 B. C.). Babylonia having been reconquered by Sennacherib, it became about 680 one of the two capitals of the Assyrian empire, under Esarhaddon, the son of that conqueror. Its great importance dates from the fall of Nineveh, when Nabopolassar made it the capital of the Chaldean empire, and began that great series of fortifications and public works which were completed by his son Nebuchadnezzar (604-561). The last successor of Nebuchadnezzar, Nabonadius, joined the league formed to check the threatening power of Persia. This brought upon him the invasion by Cyrus. Having associated with himself in the government his son Belshazzar, Nabonadius, leaving him in command of Babylon, advanced to meet Cyrus. Being defeated in the field, he threw himself into Borsippa, while Cyrus advanced to the siege of Babylon. The city was provisioned for a long siege and the strength of its walls defied direct assault. It was taken only by the stratagem of diverting the river from its course, and marching in through its dry bed. Herodotus relates that Cyrus turned the Euphrates into the great reservoir excavated by Nitocris. This appears incredible; for even assuming the existence of this reservoir, its waters must have been on a level with those of the river, and no cutting could have laid bare the river bed. Xenophon, a much better authority in this matter, says that Cyrus drained the bed by means of two new cuttings of his own, from a point above the city to another below it. If we suppose that the river was not the Euphrates itself, but a bayou or side branch, shallower than the river, the whole operation becomes perfectly comprehensible. He had only to dam up the mouth of the bayou above the city, and deepen the channel below by which it reentered the Euphrates. In an hour after cutting away the bulkhead below, the channel would be dry. This was done in the dead of night. It was a complete surprise. So confident were the besieged in the impregnability of their outer defences that they neglected to close the water gates which fronted the river at the foot of each street, and Belshazzar and his court passed the night in revelry. When morning dawned the inner defences had all fallen into the hands of the besiegers (538). Cyrus, having dismantled Babylon, moved upon Borsippa, still held by Nabonadius, who surrendered and received kind treatment. Cyrus assigned him a residence and estate in Caramania, where the last king of Babylon ended his days in peace. For a time Babylon was a royal-residence of the Persian kings. Two attempts were made to revolt, and each time Babylon stood a siege and was further dismantled. It ceased to be a royal city; its brick walls and palaces fell into decay; and when Alexander the Great took possession, it was comparatively a ruin. He intended to restore the city, and make it his Asiatic capital, but his death prevented the ex-

ecution of the scheme. His Syrian successors chose for their capital Seleucia, a few miles to the northeast, on the Tigris. A great part of this city was built with materials carried from Babylon; and when Seleucia fell into decay, from its materials the Parthians built Ctesiphon. Besides these great cities, the Persian Madain, the Oufah of the caliphs, and in a measure the more modern Bagdad, have been successively built from the ruins of Babylon. The place had become a ruin in the time of Strabo (about the beginning of the Christian era). St. Jerome, in the 4th century, learned that it had been converted into a hunting ground for the recreation of the Persian monarch, who in order to preserve the game had partially restored the walls. From that time it passed more and more out of notice, until its very site became forgotten. It is only since 1847 that it has been satisfactorily identified. Its modern representative is the

A Babylonian Brick.

village of Hilleh, with about 7,000 inhabitants. As Birs Nimrud marks the site of Borsippa, the ruins of Babylon proper consist mainly of three mounds: 1. Babil, probably the temple of Belus. This is an oblong mass, 200 yards long, 140 wide, and 140 ft. high. 2. The Kasr, or palace of Nebuchadnezzar. This is an irregular square about 700 yards each way, surmounted with the remains of a square structure, the walls of which are composed of burnt bricks of a pale yellow color, of excellent quality, bound together with a lime cement, and stamped with the name of Nebuchadnezzar. 3. A mound, now called Amran, of an irregular triangular shape, the sides being 1,400, 1,100, and 850 ft. This is supposed to be the ruins of a palace older than Nebuchadnezzar, for bricks have been found there inscribed with the names of more ancient kings. Besides these there are merely fragments of embankments, which may be parts of some of the walls.—For ancient Babylon the principal authorities are Herodotus and Diodorus Siculus; for the history and ruins, Rawlinson's "Herodotus" and "Five Ancient Monarchies," Lenormant and Chevallier's "Ancient

History of the East," Smith's "Ancient History of the East," Loftus's "Chaldaea," and Layard's "Nineveh and Babylon." To these may be added Rich's "Memoirs on the Ruins of Babylon" (1818), and "Narrative of a Journey to England by Bussorah, Bagdad, and the Ruins of Babylon" (1826); Chesney's "Euphrates Expedition" (1850); and Oppert's maps and plans (Paris, 1858).

BABYLONIA, a name applied to the southern part of Mesopotamia in the wider sense, of which Babylon became the capital. Babel, the corresponding Hebrew name, is occasionally used in Scripture in this sense; but the usual term to designate the country and the people is Chasdim, which in the Septuagint and most other versions becomes Chaldaea and the Chaldeans. Babylonia included the space between the Euphrates and the Tigris now known as Irak-Arabi (see **IRAK-ARABI**), together with the strip of territory west of the Euphrates, bordered by the Arabian desert. This country, made wonderfully fertile by an almost unparalleled network of canals, and peopled by Semites, Cushites, and Turanians, was the seat of one of the earliest and most powerful kingdoms of antiquity. (See **CHALDEA**.) From the establishment of the kingdom down to 625 B. C. the history of Babylonia is chiefly known in connection with its contests with Assyria. (See **ASSYRIA**.) About that year lower Babylonia rose against Assyria, and was joined by Media. Aashur-bani-pal, the Assyrian king, placed the force in Babylonia under the command of Nabopolassar, apparently a Chaldean. But Nabopolassar entered into a league with Cyaxares the Mede, to whose daughter he married his son, afterward the great Nebuchadnezzar. The Assyrians were defeated by the combined Medes and Babylonians, and Nineveh was destroyed. Babylonia became independent, her boundaries being enlarged on the north by the addition of a few miles between the rivers, on the west by a strip beyond the Euphrates, and on the east by the annexation of Susiana. The greater portion of Assyria fell into the hands of the Medes. For nearly the whole of his reign, which ended in 604, Nabopolassar was occupied in organizing his kingdom. Toward its close Necho, king of Egypt, attempted to extend his dominion to the Euphrates. The Assyrian king sent against him an army under his son Nebuchadnezzar. The Egyptians suffered a total rout at Carchemish on the Euphrates, and the victors took possession of the whole country between the Euphrates and the "river of Egypt"—not the Nile, but a small stream falling into the Mediterranean at El-Arish. Nebuchadnezzar had pursued the beaten enemy to the frontier of Egypt when he received tidings that his father was dead. Intrusting his army, with the captives and spoil, to the command of his lieutenant, to lead them home by the usual circuitous route, he hurried with a small escort straight across the desert. The chief of the Chaldean

priests had acted as regent; and when Nebuchadnezzar appeared the crown passed to him without opposition. He reigned 43 years (604-561). With the exception of the period of his seven years' madness, probably near the close of his life, his was among the most glorious reigns in history. Yet, save his name stamped upon innumerable bricks, and the "standard inscription" found among the débris of the temple of Belus, there is not a line of native contemporary history of his reign. The standard inscription speaks only of the great architectural, military, and hydraulic works which he constructed at Babylon. On that series of events which connect him with the history of the Jews, the Bible speaks with considerable minuteness; for the rest we have only a few scattered fragments preserved by the chronographers. Herodotus never names him; and Xenophon had another hero to celebrate. His wars lasted about 35 years, in the course of which he became master of Syria, Judea, Phœnicia, Moab, and Edom, and twice carried his victorious arms into Egypt, far up the Nile, apparently subjugating the country, and placing upon the throne a monarch of his own choosing. But during all this time he was busy in completing the great works at Babylon which his father had commenced. For these his conquests gave him an abundance of such material as could not be supplied by the clay of his own dominion; while his settled policy of dealing with conquered peoples, transporting them in mass to Babylonia, furnished the requisite laborers. He was thus able, without burdening his own people, to carry out his great architectural schemes. The captives were colonized in all parts of Babylonia; forced labor was required of them, and by this the walls of Babylon were raised, the temples and palaces built, the canals and reservoirs excavated, which formed the special glory of the Babylonian monarchy. Making all allowance for the evident exaggeration of later historians, there can be no doubt that Nebuchadnezzar was the greatest building ruler the world has ever seen. Still, from its very nature, his kingdom could not be a lasting one. Literally, as well as metaphorically, its feet were of clay. Its chief military strength lay in its cavalry. The low hot country could furnish no stout infantry capable of withstanding the attacks of the formidable Medo-Persian power which was growing up among the mountains on the east. Nebuchadnezzar must have perceived this; for, in the absence of all natural defences, he set himself to transform his capital into an immense fortified camp, capable of holding a nation, and with walls impregnable to assault. Within three years after the death of Nebuchadnezzar Cyrus revolted against Astyages, and, placing himself at the head of the now formidable Medo-Persian kingdom, began that series of wars in which Babylonia became involved, and which in less than 20 years ended in her overthrow. Nebu-

chadnezzar was succeeded by his son Evil-merodach, of whom but a single act is recorded. He released Jehoiachin, the captive king of Judah, from his imprisonment of 37 years, and treated him with distinguished favor, though still detaining him in Babylon. After a reign of two years Evil-merodach was assassinated by his brother-in-law Neriglissar, who died in less than four years, and was succeeded by his son Laborosoarchod, a mere boy, who in nine months was put to death by a conspiracy formed by his relations. He was succeeded (555) by Nabonadius, the sixth and last king of Babylonia. He appears to have belonged, like Neriglissar, to the priestly order; and it has been conjectured that he was married to Nitocris, a daughter of Nebuchadnezzar, and that she was queen regnant. This conjecture, if admitted, would confirm the statement of Herodotus that many of the defensive works at Babylon, especially designed to repel the Medes, were the work of a queen named Nitocris. It is certain that some of these were constructed during the reign of Nabonadius. If we may assume that his queen was a daughter of the great Nebuchadnezzar, and co-sovereign with her husband, it would be quite natural that tradition should give her the credit for these constructions. Moreover, we are told that Nabonadius was not related to the boy Laborosoarchod, and so could not have been a descendant of Nebuchadnezzar; but in Daniel the queen addresses Belshazzar, the son of Nabonadius, as the son or descendant of Nebuchadnezzar. If now we suppose this queen to have been the queen-mother, and so the wife of Nabonadius, all the accounts are brought into harmony. She speaks also with a kind of authority natural for a mother in addressing her son, but hardly to be expected from a young oriental queen toward her husband. The queen also is especially distinguished from the wives of Belshazzar. At all events, Nabonadius at length perceived the danger which was impending from the direction of Persia. Cyrus was engaged in his war against Cræsus, king of Lydia. Nabonadius joined in the alliance between Lydia and Egypt against Cyrus; but it appears that the Babylonian forces did not arrive in time to take part in the campaign which ended with the overthrow of Cræsus at Sardis. Lydia subjected, Cyrus turned his arms against Babylonia. In 539 the Persian army moved to the Tigris. They wintered on the banks of the Gyndea, and in the spring crossed the Tigris and overran the whole upper country. Nabonadius, leaving his young son Belshazzar in charge of the capital, gave battle under the walls of the city. The Assyrians were defeated, and the king threw himself into the strong fortress of Borsippa, a few miles distant. Cyrus now formally invested the city, and having, after a long siege and bold enterprise (see BABYLON), secured complete possession of it, was about to attack

Borsippa; but Nabonadius surrendered without offering any defence. Thus, in 538, the Babylonian kingdom came to an end. The book of Daniel relates that Darius the Mede, son of Ahasuerus, was made king over the realm of the Chaldeans, being then 62 years of age. Attempts have been made to identify this Darius with several princes of Medo-Persia. All these attempts involve insuperable chronological difficulties. Possibly he was a Median nobleman, not elsewhere named, whom Cyrus appointed as viceroy over Babylonia. This seems indeed to be implied by the phrase of Daniel, that "he was made" king. His vicereignty lasted only two years, being most likely ended by his death; and Cyrus then personally assumed the sovereignty. The captive Jews, who were subject to the direct rule of Darius, naturally spoke of him as king, and usually reckoned the years of Cyrus from the beginning of his personal reign at Babylon, though he had been king of Persia for 20 years. Among the first acts of Cyrus after taking upon himself the government of Babylonia, was to issue an edict permitting such Jews as chose to do so to return to Jerusalem and rebuild the temple. The date of the issue of the edict is one of the epochs which have been fixed upon as the close of the 70 years of captivity. (See BABYLONISH CAPTIVITY.) The overthrow of the Babylonian kingdom marks the period when the empire of the East, so long held by the Semitic stock, passed into the hands of the Aryan race, who retained it for 12 centuries, when it was again wrested from them by the Mohammedan conquest. But for 2,400 years Babylonia has ceased to have any special history of its own, being successively under the sway of the Persians, Greeks, Parthians, Neo-Persians, Saracens, and finally Turks, under whom the country has sunk deeper and deeper into decay.

BABYLONISH CAPTIVITY, the period during which the Jewish people who had been carried away from their country to Babylonia, with their descendants or any part of them, were forcibly detained in a foreign land. It is reckoned as beginning at some point in the reign of Nebuchadnezzar, and ending in the reign of Cyrus or of Darius I. The earliest point thus fixed for the beginning of the captivity is 605 B. C., when Nebuchadnezzar, commanding the forces of his father Nabopolassar, first took Jerusalem; the latest 516, when the building of the second temple was finished. But here is an interval of 89 years, whereas the duration of the captivity is several times stated to have been 70 years. There are two periods of this length, either of which might properly be considered as measuring the captivity. Counting 70 years from 605 B. C., when Daniel was carried off, brings us to 535, or, loosely speaking, to 536, the date of the decree of Cyrus permitting the return of the Jews. This would naturally be the term of the captivity in the mind of Daniel, who re-

fers to the prediction of Jeremiah that 70 years should "accomplish the desolations of Jerusalem." Nebuchadnezzar several times invaded Judea to punish the repeated revolts of his vassals, and at each time carried off considerable numbers, but still did not go to the extent of devastating the country. It was not till the rebellion of Zedekiah, in 588, that he proceeded to the extremity of destroying Jerusalem, burning the temple, and carrying away all except the common people of the country. This wholesale destruction, executed in 588, would seem to be a natural period from which to date the captivity. From this time to that when the temple was reconstructed, 516, is another period of 70 years, covering just the time during which the temple worship and sacrifices were necessarily discontinued.—The indications of the extent of the captivity are not clear; but it seems certain that first and last it included a very considerable portion of the population. The few numbers given seem rather to relate to separate companies of captives. When the decree of Cyrus permitting the return was proclaimed, a company of 42,360, besides 7,837 slaves, at once set out under Zerubbabel; and it is probable that there was a considerable stream of emigration back to Judea. But it is evident that only a small proportion of the Jewish people returned. The temple being reestablished, the priests would be among the most likely to return; and as out of the 24 courses only four went, it has been conjectured that at least five sixths of the people remained in their new homes. There was little inducement for them to migrate to Judea, an outlying satrapy of a great empire, impoverished by war, and bordered by unfriendly peoples. They had become naturalized in their present homes, where their treatment was mild. In Psalm cxxxvii., where the exiles pour out their griefs, the only complaint as to their treatment in captivity is that they were required to sing their native songs. The burden of their imprecations is against the atrocities committed in actual warfare, and against their former neighbors, the Edomites, who had exulted over the destruction of Jerusalem. They were captives only in name. They were really colonists, not slaves. They had followed the wise advice of Jeremiah, to live peaceably with their neighbors, build houses and dwell in them, and plant gardens and eat of the fruit of them. There was nothing to prevent a Jew from rising to the highest eminence in the state. Daniel occupied an eminent position in Babylon, both under the Chaldeans and the Persians. It is no wonder that with the prudence of their race the majority chose to remain in the prosperous regions where they were born, rather than migrate to the disturbed country whence their fathers had been brought. Before long they were scattered through every province of the Persian empire. We find no instance of hostility to them for more than half a century—

their ancestral enemy Haman succeeded in exciting the suspicions of the vain and jealous Ahasuerus, the Xerxes of classical history. That they had by this time become very numerous is evinced by the loss which their enemies met in the attempt to massacre them. In the capital alone 800 were killed, and in the provinces 75,000. It was not till long after this date, when the Persian empire had fallen into disorder, that any considerable proportion of the Jewish population migrated to Palestine; and even then great numbers went to other countries, where for centuries they were known as "the dispersion."—It is probable that a portion of the descendants of the Israelite captives who had been carried to Assyria more than a century before the first Jewish deportation under Nebuchadnezzar, gradually amalgamated with the captives from Judea, so that the present Hebrews all over the world belong to the twelve tribes, not merely to the two of Judah and Benjamin and the Levites who lived among them. This amalgamation appears to have begun early, for of the 42,000 who went up with Zerubbabel under the decree of Cyrus, about 30,000 are specially noted as belonging to Judah, Benjamin, and Levi, whence it may be fairly inferred that the remaining 12,000 belonged to the other tribes.

BABYRONIA, or *Babirus*, an animal of the swine family, peculiar to some of the Malay islands. It is about 3½ ft. long and 2½ ft. high; the legs being longer and the body more slender than in others of the swine species. It does not root in the ground, but lives upon fallen fruits. The tusks of the lower jaw are long and sharp. Those of the upper jaw, instead of growing downward in the usual manner, are reversed, growing upward from bony sockets near the snout, and curving backward until they almost touch the forehead. They sometimes attain the length of 8 or 10 inches, and are found only in the male. Their use is undetermined;

Babirusa (*Sus babirusa*).

they cannot be weapons of offence. Some have supposed that they serve to protect the eyes from the spiny plants among which the animal finds its food; but they would for this purpose be equally necessary for the female, which must seek its food in the same way as the

male. From these horn-like tusks, and its comparative lightness of appearance, it derives its Malay name, which signifies the "hog-deer." It is quite as fierce as the wild boar, and an excellent swimmer, often taking to the water for mere pleasure.

BACCARA, or *Baccarat*, a French game of cards, said to have been first introduced into France from Italy at the time of the wars of Charles VIII. Any number of players may participate, and as many packs of cards may be used as necessary. The face cards each count ten, and the others according to the number of their spots. After the bets have been made the banker deals two cards to each of the players, including himself. The aim is to make the numbers 9, 19, 29, or as nearly those as possible, as 8, 18, 28; and any player is at liberty either to "stand" or be "content" with the two cards first dealt, or to call for more at the risk of exceeding 29, when his stake is forfeited to the dealer. If, after the first distribution of two cards to each, any player has a "natural," that is, a sum making 9, or next in value 19, he declares it wins, and the banker pays all who hold superior hands to his own, and claims from those holding inferior. This game has become common in America, where it is played in a slightly different manner, the face cards and tens counting nothing, and the "naturals" being the sums 9 and 8.

BACCARAT, a town of France, in the department of Meurthe, 16 m. by railway S. E. of Lunéville; pop. in 1866, 4,768. It is picturesquely situated at the foot of a steep mountain on the river Meurthe, and is celebrated for its flint-glass manufactory, which employs 1,100 hands, and produces over 8,000,000 francs' worth annually. The manufacture was greatly improved and cheapened by the invention of a bellows for shaping the glass by one of its workmen, Ismaël Robinet, about 1823.

BACCHANALIA, or *Dionysia*, the festivals of the Greek god Bacchus or Dionysus. The most important were held in Attica and Athens, and were four in number. 1. The country or lesser festival was held in all the country districts of Attica, under the superintendence of the demarchs or local magistrates, in the month Poseideon (December), when the vintage was just over. There was a tumultuous procession of men and women, some riding in a cart and casting scurrilous jests and abusive language at the bystanders, and some carrying the phallus, the emblem of the generative power in nature. The phallic hymn was sung,

old comedies and tragedies were enacted, the slaves had temporary liberty, large quantities of wine were drunk, and unbounded license prevailed. 2. The wine press festival, or *Lenaea*, was held in a suburb of Athens in the month Gamelion (January), when the wine was just made and the presses cleaned. This festival, which was celebrated in Asia Minor also, was at Athens under the superintendence of the king-archon, and the expenses were paid by the state. There was a public banquet, a procession, and dramatic entertainments in which new comedies were represented. 3. The flower festival, or *Anthesteria*, was held at the same place as the *Lenaea*, in the month Anthesterion (February), and lasted three days. On the first day the vintage was broached and tasted, and persons were initiated into the mysteries of Bacchus. On the second day there were games, and on the third flowers were offered to the god. During the festival the slaves were free, presents were sent to friends, and pupils paid their instructors. 4. The

Bacchanalian Procession.

town or great festival was held at Athens in the month Elaphebolion (March), when the city was filled with strangers from all Greece. The festival was celebrated in the most magnificent manner under the superintendence of the chief archon, at the expense of the state, and consisted of a banquet, a procession, and the acting of tragedies. A prize was awarded for the best play, and, with exceptions in favor of *Æschylus*, *Sophocles*, and *Euripides*, no play which had once won a prize could be repeated. All these festivals were seasons of riotous merriment and drunkenness. In the processions Bacchus himself was represented, attended by delirious women called *Lenæ* or *Bacchantes*, who carried thyrsus staffs, cymbals, swords, or serpents, and, made furious by dithyrambic songs, flutes, and wine, danced along in a state of frenzy. Men, covered with skins, masked, and painted to represent fauns and satyrs, accompanied them.—The Romans celebrated the *Bacchanalia* every third year; but such excesses attend-

ed the secret initiation, which was held by night, and the society became so dangerous, that in 186 B. C. the consuls, by the authority of the senate, issued a proclamation commanding that no Bacchanalia should be held either in Rome or in Italy. After this decree the Liberalia, the festival of Liber, a similar but more moderate rite, was celebrated annually on the 16th of March, and on that day the young men assumed the *toga virilis*.

BACCHANTES, in early antiquity, those women who took part in the secret festivities in honor of Bacchus; subsequently, when males were also admitted, the term was applied to all those initiated into the Bacchanalia. In the slang of mediæval university students, the name was given to those who had not yet completed their first year's studies, and under imposing rites and plausible pretexts were taxed for drinking purposes and initiated in debaucheries by the seniors. Later the name was applied to idle students who led a dissipated life, begging under the pretence of collecting the means for future studies. They were organized into bodies with constitution and rituals, and in many cities public boarding houses were established for them. Sometimes they managed to become teachers, and it was a recommendation for a high school to have many such scholars. For heavy fees in drink they gave instruction in the tricks of their wandering life to younger students, who, under the name of *Tirones*, acted as their servants, stole and begged for them, and were harshly treated. There exist in German two autobiographies of such Bacchantes, Burkard Lingg and Thomas Plater. The reformation stopped these practices; but traces of them lingered in Germany and England down to the 19th century.

BACCHIGLIONE, a river of northern Italy, in Venetia, about 90 m. long, which rises in the Alps, N. W. of Vicenza, flows past that city and Padua, and empties into the lagoon of Venice near Chioggia. Large boats ascend it to Vicenza.

BACCHUS, in classical mythology, the god of wine, known among the Greeks as Dionysus, and often called by the Romans Liber. He was the son of Jupiter and Semele, the daughter of King Cadmus. Juno avenged herself by visiting Semele in disguise, and inducing her to demand of Jupiter that he should appear before her clothed in the attributes of his majesty. No mortal could bear this sight, and Semele was destroyed. Jupiter, however, preserved the still-born child, enlarded him in his own thigh until the proper period for birth, and gave him to the sister of Semele and her husband, and, when Juno persecuted these, to the nymphs, for education. The nymphs brought him up at Nysa in Thrace, where Silenus also assisted in teaching him. Bacchus taught men the cultivation of the vine and the art of wine-making. He collected bands of worshippers, principally women, and surrounded by these, and seated in a chariot drawn by panthers or

leopards, he passed through many countries, and even penetrated to India. His followers, maddened with wine and license, and carrying the thyrsus, a hollow wand twined with ivy and vine leaves, attacked those even of their own families who resisted the introduction of the new religion. Pentheus of Thebes was thus killed by his own mother, who was among the Bacchantes.—The Greek legends of the adventures of the god were almost innumerable. He flayed Damascus alive, who opposed him in Syria; visited Lycurgus, king of the Edones, with madness in which he killed his own son; and after the king again became sane, caused him to be torn in pieces by wild horses. He overcame the Amazons. Carried off to sea while he slept by a party of sailors who purposed selling him as a slave in Egypt, he caused the vessel to stand still while vines and ivy grew around the mast and spars, and wine flowed from the deck; then he assumed the form of a lion, and afterward of a bear, killed the captain, and changed the seamen into dolphins, preserving only the pilot, who had warned the crew against molesting the god. The traditions concerning him are very differently given by different authors. Even concerning his birth the legends were contradictory, while the methods of his worship in different countries were widely at variance. He was represented in some works of art as an infant, but generally by the Greeks as a beautiful boy; while in the East he was pictured as a man of middle age and majestic figure, clothed in long robes. His festivals and religious rites, which, originating in Thrace, became wild orgies and scenes of license in Greece and Rome (see BACCHANALIA), and were finally suppressed in the latter city, were probably originally simple ceremonies in honor of the rich and productive power of nature, which he, as god of wine, undoubtedly represented. Among the powers which were attributed to Bacchus were those of prophecy, of healing certain diseases, and of increasing the productivity of the earth.

BACCHYLIDES, a Greek poet, born at Iulis in the island of Ceos about 512 B. C.; the period of his death is uncertain. He was a nephew of Simonides and a contemporary of Pindar, and passed most of his life at the court of Hiero of Syracuse. Fragments of his works were published by Neue of Berlin in 1822. They are also found in Bergk's *Poeta Lyrici Græci* (2d ed., Leipsic, 1853). The most recent edition is by Hartung, with a German version (in the *Griechische Lyriker*, 6 vols., 1857).

BACCIO DELLA PORTA. See BARTOLOMMEO.

BACCIOCHI, *Napoleone Elisa*, a Bonaparte princess, cousin of Napoleon III., only daughter of Elisa, the eldest sister of Napoleon I., princess of Lucca and Piombino, and afterward grand duchess of Tuscany, and of Prince Felice Pasquale Bacciochi, a Corsican nobleman (see BONAPARTE), born in Italy, June 8, 1806, died in her château Kour-el-Ouet, Brittany, Feb. 3 or

4, 1869. In 1825 she married Count Camerata, a wealthy landed proprietor of Ancona. Separating from him in 1830, she resided on her Illyrian domain, engaged in lawsuits for inheritance against her uncles. She devised ineffectual plans for the escape from Schönbrunn of her cousin the duke of Reichstadt, in whose fate she took a profound interest. She spent the latter part of her life in France, and bequeathed the bulk of her fortune to the prince imperial, son of Napoleon III.—Her only son, NAPOLEÓN CAMERATA, killed himself March 3, 1853. Her nephew, Count FELICE BACCIOCHI, born in the early part of this century, died in Paris, Sept. 23, 1866. He inherited the large fortune of his grandfather, prince of Lucoa and Piombino. He was the devoted friend and first chamberlain of Napoleon III., superintendent of the theatres of France, and shortly before his death was made a senator.

BACH, the name of a celebrated musical family in Germany. In no department of science, art, or literature has any single family ever achieved such distinction, either from the number of its members who have devoted themselves to the same pursuit, or the talents, genius, and learning which they have manifested in it, as that of Bach in music. Fifty individuals at least of this name, whose lives spread over a period of 2½ centuries, would deservedly occupy an extended space in an exclusively musical cyclopædia. I. **Veit**, the founder of the German family of the name, was originally a baker by trade, a Protestant in religion, at Presburg in Hungary, whence about the year 1600 he was driven by persecution, with his family, and sought a refuge in one of the small cities of Thuringia. He had received a musical education, and was noted for his skill upon the guitar. II. **Hans** (JOHANNES), the eldest son of Veit Bach, and the ancestor of most of those of whom mention will be made, was a manufacturer of tapestry and town musician at Wechmar in Gotha. He died in 1626, leaving three sons: **JOHANN**, born in 1604, who was appointed organist and director of the city music at Erfurt, which offices he retained from 1635 till his death in 1678; **CHRISTOPH**, born in 1613, died in 1661; and III. **Heinrich**, born at Wechmar in 1615, died at Arnstadt in 1690. He was instructed in music by his father until, needing a teacher of greater knowledge, he was sent to his brother Johann at Erfurt, where in a few years he became a very accomplished organist and musician in the fashion of that epoch. He was employed in these capacities successively by the city authorities of Schweinfurt and Erfurt, until he was called in 1641 to Arnstadt as organist, a place which he filled with great honor till his death.—The Bachs of the next (the fourth) generation were nine in number. IV. **Johann Egidius**, the second and the most noted of the three sons of Johann, born in 1645, died in 1717. Upon the death of his father he succeeded him as organist and direc-

tor of the city music at Erfurt. V. **Georg Christoph**, eldest son of Christoph, born in 1642, died in 1697, was cantor and composer at Schweinfurt. VI. **Johann Ambrosius**, brother of the preceding, born in 1645, died in 1696. He was a court and city musician at Eisenach, a sound theorist and of repute in practical music, and was the father of the great Johann Sebastian. VII. **Johann Christoph**, eldest of the two sons of Heinrich, born in 1643, died in 1703. He stands in musical history as one of the very first of German organists, contrapuntists, and composers of his era. He studied music with his father so successfully as at the age of 22 to be called to Eisenach into the service of the court and city, as organist. At the time in which he lived but little music comparatively appeared from the press, and the works of one who lived the retired life of an organist in a small Saxon city could scarcely become known out of his own immediate sphere. His compositions, of which he left a vast number in manuscript, composed for the church and court where he officiated, prove, says Gerber, "that he was truly a great man, as rich in invention as he was strong in the power of musical expression of emotion." A century after his death, at the time when Mozart, Haydn, and Gluck had become models in composition, selections from his works were performed in Hamburg with great success, exciting no small degree of astonishment by their freshness, beauty, and freedom from the trammels of the dry contrapuntal school. So far as the musical taste of his age allowed, his works in general are found to be melodious and truly vocal, at the same time being remarkably full in harmony and very grand in effect. One of his compositions, dated 1684, is a motet in free style, in which, among the (at that time) novelties of construction and harmony, is found the extreme sharp sixth. On the back of the sheet upon which it is written is another piece of sacred music in 22 parts, *obligato*, the harmonic relations of which to the motet are perfect. The list of his works contains also a motet for St. Michael's day in 22 real parts, a piece of wedding music in 12 parts, another motet for eight voices, instrumented for two choirs and orchestras, a solo for an alto voice with accompaniment for violin, three viols di gamba, and bass, &c. VIII. **Johann Michael**, brother of the preceding, 2d son of Heinrich, was born at Arnstadt about 1660, and became organist and city scribe in one of the Thuringian towns. He was an industrious and effective composer for the church, harpsichord, and organ. One of his vocal works, performed in Berlin a few years ago, surprised every auditor by its beauty and modern coloring. His daughter became the first wife of Johann Sebastian Bach.—The family tree gives 17 Bachs of the next (the fifth) generation, of whom the most distinguished were the following: IX. **Johann Bernard**, eldest son of J. Egidius, born Nov. 23, 1676, died June 1, 1749. He was organist

of the Merchants' church of his native city, Eisenach, of a church in Magdeburg, and in 1703 successor of Johann Christoph as court and city organist at the former place. He distinguished himself especially in his choral preludes, and by his overtures in Telemann's style. **X. Johann Sebastian**, in some respects the greatest musician that has lived, third and youngest son of Johann Ambrosius, born at Eisenach, March 21, 1685, one month after the birth of Handel at Halle, died at Leipsic, July 30, 1750. At a very early age he lost his mother, and had hardly completed his 10th year when his father died also. The little orphan was then placed under the care of his brother Johann Christoph, organist at Ohrdruff, with whom he continued his musical studies and began the practice of keyed instruments—the harpsichord and organ. His pupilage here was short, being ended by the death of Christoph, which occurred shortly afterward. He then found a place as treble singer in a choir at Lüneburg, not many miles from Hamburg, remaining there until his voice changed, with the advantages of an excellent school and the best musical instruction, and in the receipt of a small stipend, yet sufficient for his boyish necessities. His enthusiasm for the organ and his zeal for music in other forms and styles, at this period, are sufficiently attested by his foot journeys to Hamburg to hear Reinke, the great organist, and to Celle to listen to the French band in the service of the prince. With the change in his voice came the loss of his place and the necessity of entering upon a new field. Like Handel, he had studied the violin, and it was now his resource. At the age of 18 he journeyed to Weimar, and entered the service of the court there as violinist. His leisure hours were still devoted to the organ, to counterpoint, and composition, and in less than two years, though hardly 20 years of age, he was called to Arnstadt to fill the place of organist, probably in the church where his father's uncle Heinrich had so long officiated. The three years spent in Arnstadt were years of most devoted study, and during that time he developed those powers which afterward placed him above all rivalry. Besides the labor which he devoted to the working out of his own conceptions, he let nothing escape him which appeared from the pens of Bruhns, Reinke, and Buxtehude. He was so charmed with the works of the last named that he went to Lünebeck to hear him play, and prolonged his visit to a stay of three months, merely to listen to him in the church, for his acquaintance he did not make. In 1707 he accepted a call to Mühlhausen, and the following year returned to Weimar in the capacity of court organist. Encouraged by the continued applause of the court, he exerted himself to the utmost, and his principal compositions for the organ date during the seven years of his service there. In 1714 he became concert master to the duke, with the additional duty of composing and conducting the

vocal music of the ducal chapel. Here, doubtless, began the enormous list of works in every form of sacred music, which, mostly in manuscript, are preserved in the musical libraries of Berlin, Leipsic, and other cities. Here, too, he had constant practice in writing orchestral works and instrumental chamber music, and fitted himself for a larger stage of action. In 1717 Marchand, then at the head of French organists, appeared in Dresden, and charmed King Augustus so greatly by his skill as to receive an offer of a very large salary to enter his service. Volumier, also a Frenchman, the concert master of the king, invited Bach to the capital to a trial of skill with Marchand. The Saxon accepted the invitation, and through the kindness of Volumier had an opportunity of hearing his rival. With the knowledge and consent of Augustus, Bach sent his challenge to the French artist, which was accepted. At the time fixed, Bach appeared at the house of the minister where the contest was to take place. The king and company waited long, but Marchand came not. At length came news that he had left the city early that day by extra post. The greatness of the German organist, however, more than made good the loss. Bach returned to Weimar, but soon after accepted the office of kapellmeister to the court at Köthen, where he remained, composing for and directing the orchestra, till 1723, when the city authorities of Leipsic elected him to the position of musical director and cantor of the Thomas school. At the age of 38, then, Bach, rich in all that study of theory, hearing the best models of his age and country, practice as member and leader of orchestras, and constant exercise in composition for church and concert room, could give him, devoted himself to teaching and to the working out of his lofty conceptions of the musical art. Twenty-seven years he thus lived and labored, surrounded by his pupils and his large family of sons, composing music sacred and secular in all the forms then known except the opera and dramatic oratorio, and leaving as the fruits of those years a mass of compositions which, for number, variety, and excellence, form perhaps the most astonishing monument of musical genius and learning. Mozart and Handel alone can at all come in competition with him in this regard. Of the few works from his pen which appeared in his lifetime, most are said to have been engraved upon copper by himself with the assistance of his son Friedemann, and this labor, added to his others so numerous, finally cost him his sight. A few years later, at the age of 65, an attack of apoplexy carried him to the tomb. He was twice married, and left 10 sons, all of them fine musicians, and several of them among the very first of that great period in the history of the art of which Mozart, Haydn, and Gluck were the chief ornaments. This great musician had no cause to complain of a want of due appreciation, either as organist or composer. Very soon after his establishment in Leipsic, the duke of

Weissenfels conferred upon him the title of kapellmeister, with the emoluments of the office, without requiring his personal attendance at court; and in 1736 Augustus of Saxony created him "royal Polish and Saxon electoral court composer." In 1747 he was persuaded to accept an invitation from Frederick II., king of Prussia, to visit Berlin and Potsdam. Notice was given the king of his arrival in the latter city, just as a private concert in the palace was to begin. "Gentlemen," said Frederick, "old Bach has come!" The old organist was instantly sent for, and without affording him time to change his dress, he was brought to the palace. The king had several of Silbermann's pianofortes in various apartments—one may still be seen there—and to these in succession Bach was taken and called upon to try their powers. At length the king gave him a theme for a fugue, which was so wrought out as to afford him the highest gratification, and he immediately afterward demanded an extemporaneous fugue in six parts. Bach thought a moment, and, selecting the theme, worked it up to the astonishment not only of the king but of the several distinguished musicians present. Upon his return to Leipsic he wrote out the fugue, added to it another in three parts, and a *ricercar* also in six, both upon the same theme, together with other specimens of his powers, and published them with the title of "A Musical Offering." The only works by Bach published during his life are exercises for the harpsichord, in three parts, which appeared at intervals; an air with 30 variations; six choral preludes in three parts for the organ; variations in canon upon the choral *Vom Himmel hoch*; and the "Musical Offering." The rest of his works, left in manuscript, have come out one by one, or still remain unprinted. The Bach society at Leipsic, having over 500 members in all parts of the art world, has been engaged since 1850 in publishing a complete collection of his works. Among them are found five complete sets of vocal pieces for the church, for all the Sundays and festivals of the year; a great collection of oratorios, masses, magnificats, sanctus, pieces for birth, wedding, and funeral occasions, and not a few comic compositions; five "passions," so called, compositions to which the accounts of the suffering and death of Christ, as given by the evangelists, furnish the text; more than 100 sacred cantatas are preserved in the library of the Thomas school alone. "The Well-tempered Clavier," a collection of 48 preludes and 48 fugues, is known to every earnest student of the pianoforte, as remarkable in its adaptation to the purpose of enabling the performer to conquer the difficulties of that instrument. His works for organ, harpsichord, orchestra, and every solo instrument in use a century since, are as numerous and effective as his vocal compositions, and begin again to form a part of the programmes in the principal concerts of central Europe. As a virtuoso upon keyed instruments, Bach seems to have antici-

pated the wonderful effects produced in our own days by Thalberg, and even Liszt. In his own age he was in this regard—as has been said of Shakespeare as a poet—so far above all others as to have no second. The fingering invented by Bach was the basis of his son Emanuel's work upon the pianoforte, which opened a new era for the instrument, and led the way, through Mozart and Clementi, to the extraordinary perfection exhibited by the virtuosos of our own time. To it he was brought by his own works, for, as he himself said, "he had often been compelled to study long at night how to play the compositions which he had written during the day." Perhaps the most striking points in Bach's compositions are the marvellous invention they exhibit, and their extraordinary grandeur, power, and science.—Of the sixth generation of the Bach family, some 80 in number, the more distinguished were the following: **XI. Johann Ernst**, born at Eisenach, June 28, 1723, died in 1781. He was educated at the Thomas school and the university of Leipsic, made jurisprudence his profession, and settled as an advocate in his native city. But he was a Bach, and music early drew him from the law. At the age of 28 he was made assistant organist to his father, and finally appointed kapellmeister by the duke at Weimar. Life at court proved disagreeable to him, and upon the death of the duke he returned to Eisenach and to his former position. He was an industrious and successful composer for the church, and while at Weimar produced a great number of orchestral works. Few of his compositions were printed. **XII. Wilhelm Friedemann**, eldest son of Johann Sebastian, born at Weimar in 1710, died in Berlin, July 1, 1784. Of all the Bachs born since Sebastian, this man seemed by nature the best fitted to succeed to the high position which his father held in the art. His genius was of the highest order, and the progress which he made in childhood under his father's instructions gave rise to the brightest hopes for the future. In his early and extraordinary mastery both of the practice and theory of music, he seems to have more nearly rivalled Mozart than any other. His compositions were remarkable for their power and depth, and by his command of the harpsichord and organ in reproducing instantly any musical idea which occurred to him, he aroused the wonder of all who heard him. He studied the violin with the celebrated Graun, afterward concert master to Frederick II. of Prussia, with equal success. He passed through regular courses of instruction at the Thomas school, and then entered the university at Leipsic, where he devoted himself to jurisprudence and mathematics. To the latter science he specially inclined, and retained his fondness for it throughout life. Music, however, was not neglected, and in his 28d year he was called to Dresden as organist in the Sophia church. He remained there till 1747, when he removed to Halle as music director and organist,

where he remained about 20 years, and hence is often named in musical works "the Halle Bach." At the age of 57 he gave up his place, and departed to Leipsic, with nothing certain in view. During the remaining 17 years of his life, without a fixed position, he was a sort of vagabond, teaching and practising music in Brunswick, Göttingen, and Berlin, dying in a miserable condition at the age of 74. This man was recognized by all his contemporaries as the greatest musical genius then living. Unfortunately he was also a man of execrable temper, rude in his manners, almost brutal; possessed of a professional pride which rendered him intolerable to other artists; absent-minded in the highest degree; and a drunkard. During his long residence in Halle he was a constant source of trouble at the church of which he was organist. When on his way thither, he would sometimes forget his errand and wonder why the bells were ringing; sometimes he would enter the church at one door, forget himself, and pass out at the other. He often gave the organ-blower the keys of the instrument in order that, in case of his forgetfulness, some one else might take his place. Sometimes he would forget himself while at the instrument, and play on until the patience of priest and people was alike exhausted. In consequence of a severe reproof upon such an occasion, the now old man gathered up his worldly possessions and went off to Leipsic. The works of Friedemann Bach are few in number, but these few are such as to cause every musician to deplore the sad waste of genius and talent which his life exhibits. **XIII. Karl Philipp Emanuel**, sometimes called the Hamburg Bach, third son of Johann Sebastian, born in Weimar, March 14, 1714, died in Hamburg, Sept. 14, 1788. In his childhood he was thoroughly grounded in music, practical and theoretical, and afterward followed his brother Friedemann to the Thomas school and university in Leipsic. Like him, too, he studied jurisprudence there, and pursued the science further in Frankfort-on-the-Oder. In this city he founded and directed a musical society, which often sang compositions from his pen. At the age of 24 he removed to Berlin, where he lived privately till 1740, when he was appointed chamber musician and accompanist to Frederick II. in that monarch's flute solos. In 1767 he accepted a call to Hamburg as music director. He was one of the most prolific composers of his time, and his works were popular to such a degree, that the list of those published during his life surpasses in extent that of any German composer until the appearance of Joseph Haydn. He was equally great in all departments of composition except the lyric drama, in which he had no call to exert his powers. The choruses of his oratorio "Israel in the Wilderness," and of some of his more extended works for the church, place him nearer Handel, perhaps, in their power, beauty, and ravishing vocal effects, than any other composer. As a writer of songs,

odes, and psalms, he surpassed all his contemporaries, and some of his collections reached their 4th and 5th editions soon after their publication. As a symphonist and writer of chamber music he held the first rank. Like the works of Mozart and Beethoven at a later period, his were censured as being full of strange modulations, crudities, and difficulties; but they made their way in spite of the critics, and became the foundation upon which Haydn erected his temple. While restrained within due limits by the example and instructions of his father, he nevertheless made music the medium of expression for the varying emotions of his naturally poetic spirit, and thoughts sublime, pathetic, and humorous are often combined in a manner then utterly new and surprising. Haydn was a most diligent student of his works, and declared in his old age, when he stood in the musical world with no rival but Mozart, "For what I know, I have to thank Karl Philipp Emanuel Bach." Clementi has the reputation of being the father of modern pianoforte playing. That great man, however, acknowledged in Bach his master. He became what he was through his study of Emanuel's works, and to him we owe the publication of many of them. The works of Bach for this instrument, trios, sonatinas with accompaniment, concertos with orchestra, and sonatas, are numbered by hundreds, the motive of which he explained by saying, "In my opinion, the grand object of music is to touch the heart, and this end can never be attained by the pianist by mere noise, drumming; and arpeggios, at all events not by me." His great work upon the pianoforte, the foundation of all the valuable ones which have since appeared, was the *Versuch über die wahre Art das Klavier zu spielen* ("Essay on the true Art of playing the Harpsichord," first part, Berlin, 1759), which reached its third and improved edition before his death; the second part, treating the accompaniment and the free fantasia, was published in 1762. The basis of this work, as may naturally be supposed, was found in the instructions and example of his father. It interprets and renders available the science of Sebastian Bach. **XIV. Johann Christoph Friedrich**, known as the Bückeburg Bach, tenth son of Johann Sebastian, born in Leipsic in 1732, died Jan. 26, 1795. He studied jurisprudence like his brothers above named, and like them also afterward devoted himself to music. He received the appointment of kapellmeister at an early age from the duke of Lippe-Schaumburg, and passed his life in his service at Bückeburg. His compositions were very numerous, especially for the church, no festival being allowed to pass without a new work from his pen. Although neither as a pianist nor as a composer reaching the rank of his two elder brothers, he was worthy of his name, and besides his salary received valuable presents and testimonials from his patrons. His published works consist principally of songs and chamber

music, of which six violin quartets originally appeared in London. **XV. Johann Christian**, known as the Milan or the London Bach, the eleventh son of Johann Sebastian, born in Leipzig in 1735, died in January, 1782. He enjoyed his father's instructions until his 16th year, when upon his death he went to Berlin, to prosecute his musical studies with his brother Emanuel. He bade fair to rival his elder brothers in that style of music which seems to have been in some degree peculiar to the family, and had already produced several smaller compositions successfully, when he was induced, at the age of 19, by some of the Italian vocalists of Berlin, to visit Italy. During a short stay in Milan, he attracted so much attention by his abilities as to be elected one of the organists in the cathedral. But he devoted himself almost exclusively to composition for the voice, and in 1759, upon his appearance in London, had lost much of his previous skill as a virtuoso upon keyed instruments. His style was so much admired, however, that he endeavored to recover his former great skill, but was never able to fully make up the loss his hands had sustained through disuse. In 1763 he was invited to compose an opera for the London stage, and produced *Orione*, which had a most successful run of three months. This was followed by a series of works, some entirely of his composition, others partially so. Many of his airs are admirable, and at the time were exceedingly popular, being always natural, elegant, and in the then best Italian style. He was particularly noted for the richness, variety, and beauty of his accompaniments, which showed the influence of his father and elder brothers upon him, and the profoundness of his theoretical studies. His pianoforte music, however, was in a light and pleasing style, very different from that of any other of his name. Emanuel once reproved him for it, in a letter to which he answered, "I am obliged to use baby talk, that children may understand me." Schubert says of his works: "His church music has great depth, but there is a certain worldly air to it, and one finds therein a sort of taint of corruption. All the operas written by him for Italy, Germany, and England show a master-spirit in the realm of music. This Bach had it in his power to be whatever he would, and he may well be compared to the Proteus of fable. Now he spouts water, now he breathes forth flame. In the midst of the trivialities of fashionable style, the giant spirit of his father may be discovered." His wife, Cæcilia Giassi, was long prima donna in the London opera.

BACH, Alexander, baron, an Austrian statesman, born at Loosdorf, Jan. 4, 1813. He succeeded his father in an extensive law practice, and was at first a liberal; was prominent during and shortly after the revolution of March, 1848, when he was appointed minister of justice, but soon seceded from the revolutionary ranks, and as member of the constituent assembly of that year, and minister of the

interior as successor of Count Stadion (1849-'59), he became an uncompromising advocate of the strictest centralizing principles and the most decided opponent of the autonomy of Hungary and other nationalities. He reorganized the judiciary, carried out the emancipation of the peasantry from feudal burdens, which the revolution had decreed, on the principle of indemnity to the owners of land, remodelled the political administration of the crown lands, and promoted the concordat. Detested by the liberals, he left office after the Italian war of 1859, and was minister to Rome till the end of 1865.

BACHARACH, a town of Rhenish Prussia, 26 m. by railway S. by E. of Coblenz, on the left bank of the Rhine; pop. about 1,800. It is surrounded by an old wall flanked with 12 towers, has a ruined Gothic church of St. Werner, and the dilapidated castle of Stahleck, and has long been celebrated for excellent wines, especially muscatel, although the Bacharach wines at the present day do not maintain their ancient repute. In the middle ages the town was with Cologne a chief depot of the wine trade, which is still active. The name is traditionally derived from a rock in the Rhine, called *Bacché ara* (altar of Bacchus), the exposure of which in very dry weather is regarded as prophetic of a good vintage.

BACHAUMONT, François le Colonneux de, a French writer, born in Paris in 1624, died in 1702. He was a councillor in the parliament of Paris, and acquired celebrity by his satirical publications, in prose and verse, against Mazarin. He was the first to apply the term *frondeurs* (slingers) to the cardinal's adversaries, comparing them to boys throwing stones from slings. When the parliament of Paris became reconciled with Mazarin, Bachaumont sold his councillor's commission. With his intimate friend Chapelle he travelled in southern France, and the witty narrative of the journey, their joint production, was separately published in 1704 and 1732, while other writings of Bachaumont are included in Chapelle's works (1755).

BACHE, Alexander Dallas, an American savant and hydrographer, born in Philadelphia, July 19, 1806, died in Newport, R. I., Feb. 17, 1867. He was the son of Richard Bache and Sophia Burnet Dallas, and a great-grandson of Benjamin Franklin. He attended a classical school in Philadelphia, and in his 15th year was appointed a cadet at West Point, where he graduated with high honors in 1825, becoming a lieutenant of engineers. He was retained for some time at the academy as an assistant professor, and subsequently served two years under Col. Totten in engineering work at Newport, R. I., where he formed the acquaintance of Miss Nancy Clarke Fowler, afterward his wife and his collaborator in astronomical observations. He next filled the chair of natural philosophy and chemistry in the university of Pennsylvania at Philadelphia, and became a member of the newly established Franklin institute.

A full account of his arduous labors in that period for the promotion of mechanical arts is contained in the "Journal" of the institute for 1828-'35. He was associated with Hare, Espy, and other learned men in the American philosophical society, and built a private observatory, where with his assistants he determined, for the first time in the United States, the periods of the daily variations of the magnetic needle, and made other novel and interesting observations. In 1836 he was chosen president of the board of trustees of Girard college, preparatory to organizing that institution, and went to Europe to examine the educational systems of England, France, Prussia, Austria, Switzerland, and Italy. On his return in 1838 he submitted to the trustees a full report, which contributed much to improve the American methods of public instruction. Owing to delays in the opening of the college, he relinquished his salary as president, though retaining this title till 1842. In the meanwhile he organized a system of free education in Philadelphia, at first gratuitously, and subsequently receiving a salary from the city authorities. While engaged in this work he also cooperated with the British association in the determination by contemporaneous observations of the fluctuations of magnetic and meteorological phenomena. In 1842, having completed the organization of the schools, which served as models for many similar institutions, he resumed his former chair in the university. In November, 1848, he was appointed superintendent of the United States coast survey as successor of Mr. Hassler. To this work he imparted a value and efficiency such as it had never possessed before. He was also superintendent of weights and measures, lighthouse commissioner, and afterward member of the lighthouse board, regent of the Smithsonian institution, and a vice president of the United States sanitary commission. The degree of LL. D. was conferred upon him by various universities, and he received medals from foreign governments and institutions. He was successively president of the American philosophical society, of the American association for the advancement of science, and of the national academy of sciences, the establishment of the last two societies having been chiefly promoted by his influence, and he was associated with almost all distinguished scientific bodies in both hemispheres. He bequeathed about \$42,000 to the national academy of sciences for the prosecution of researches in physical and natural science, by assisting experimenters and observers in such manner as shall be agreed upon by Professors Henry, Agassiz, and Peirce, or their successors, or by any two of them, these three trustees to constitute a board for the selection of scientific subjects, and for the publication of the observations and experiments, the expense to be defrayed out of the annual income accruing from the legacy, without touching the capital.

Among his works are: "Observations at the Magnetic and Meteorological Observatory at the Girard College" (8 vols., 1840-'47); his annual reports on the coast survey and on weights and measures; numerous contributions to periodical publications of scientific societies, including many valuable essays in the "Proceedings of the American Association for the Advancement of Science" (1829-'65); and "Lecture on Switzerland," published from his MS. in the report of the Smithsonian institution for 1870.

BACHE, Benjamin Franklin, an American physician, great-grandson of Benjamin Franklin, born in Monticello, Va., Feb. 7, 1801. He graduated at Princeton college in 1819, and at the medical department of the university of Pennsylvania in 1823; entered the navy as assistant surgeon in 1824, and in 1828 was promoted to be surgeon. While on furlough, from 1838 to 1841, he occupied the professorship of natural sciences and natural religion in Kenyon college, Ohio. He served as fleet surgeon of the Mediterranean squadron 1841-'4, and of the Brazil squadron 1848-'50. He organized and perfected the laboratory at New York whence are supplied all the appurtenances of the medical department, and of which he was director from 1855 to 1871. At the beginning of the civil war in 1861 he rendered important service to the government by rapidly restocking the laboratory on his own responsibility. He was placed on the retired list in 1863, and in 1871 was promoted to be medical director with the relative rank of commodore.

BACHE, Richard, a merchant of Philadelphia, born in England in 1737, died in Berks county, Penn., July 29, 1811. He came to America in early life, and married in 1767 the only daughter of Benjamin Franklin. At the beginning of the revolution he was president of the republican society of Philadelphia, and from 1776 to 1782 he was postmaster general of the United States.

BACHE, Sarah, the only daughter of Benjamin Franklin, and wife of the preceding, born in Philadelphia in September, 1744, died in 1808. In 1780, when many soldiers of the American army were going barefooted and half-clad, money was collected for their relief and expended for materials, which by the continued labors of many women were soon made into the needed garments. In this work Mrs. Bache was prominently engaged. More than 2,200 women were thus employed by her at one time in sewing for the army. The marquis de Chastellux, then visiting in Philadelphia, recommended her to the ladies of Europe as a model of domestic virtues and feminine patriotism. On many occasions she displayed benevolence and patriotism by serving in the hospitals.

BACHELET, Jean Louis Théodore, a French cyclopædist and historian, born in 1820. He has been professor of history in various colleges, and finally in the lyceum of Rouen. In concert with Ch. Dezobry he edited a *Dictionnaire de biographie et d'histoire* (2 vols., 1857), and

Dictionnaire général des lettres, des beaux arts et des sciences morales et politiques (2 vols., 1862-'3). Among his historical works are: *La guerre de cent ans* (1852), *Mahomet et les Arabes* (1853), and *Les hommes illustres de France* (Rouen, 1867).

BACHMAN, John, an American naturalist and clergyman, born in Dutchess county, N. Y., Feb. 4, 1790. In 1815 he became pastor of the Lutheran church in Charleston, S. C. He was a collaborator of Audubon, and the principal author of the work on the quadrupeds of North America. He has published several other writings, including a "Defence of Luther" (1853), "Characteristics of Genera and Species as applicable to the Doctrine of the Unity of the Human Race" (1854), and essays contributed to the "Medical Journal of South Carolina."

BACK, Sir George, an English navigator, born at Stockport, Nov. 6, 1796. He entered the royal navy in 1808, was for five years a French prisoner of war, subsequently served on the Trent, Lieutenant Commander John Franklin, and accompanied Capt. David Buchan on an expedition to Spitzbergen. In 1819 he accompanied Sir John Franklin's expedition from the western shore of Hudson bay to the northern coast of America, near the Coppermine river. The party reached Fort Enterprise in July, 1820, and determined to winter there, while Mr. Back returned to Fort Chipewyan (a distance of 500 miles), to obtain fresh supplies. He acquitted himself of this duty after undergoing the most terrible hardships from cold and hunger, and rejoined his party in March, 1821. The expedition returned to York Factory in 1822, and early in 1825 Lieut. Back joined Franklin's second expedition, designed to coöperate with Beechey and Parry in their efforts to discover from opposite quarters the northwest passage. He penetrated as far as lat. 70° 24' N., lon. 149° 37' W.; and on Franklin's setting out from Great Bear lake, on the return of the expedition, he was left in charge of the remaining officers and men at Fort Franklin. On the breaking up of the ice he started for York Factory, and thence set sail for England, where he arrived in 1827. In 1838 he took charge of the party sent out in search of Sir John Ross, and was exposed to hardships and perils no less appalling than on the previous expeditions. Receiving intelligence of Ross's safety, he returned home in 1835, obtained his post rank, and in June, 1836, took command of the Terror on a fresh Arctic voyage, but without accomplishing anything. He was knighted in 1837, and made rear admiral in 1857. He has published a "Narrative of the Arctic Land Expedition," &c. (London, 1838), and a "Narrative of the Expedition in H. M. ship Terror" (1838).

BACKGAMMON, a game, believed to be of English origin, played with dice and 30 pieces called men, upon a board or table peculiarly divided and marked. Chaucer, Shakespeare, and Bacon mention it under the name of

"tables." The name backgammon is supposed by some to be derived from the Anglo-Saxon words *bæc*, back, and *gamene*, a game; by others, from the Welsh *bach*, little, and *common*, a battle. The game is played as follows: The men, 15 of which are black and 15 white, in shape like those used in draughts, are arranged, as shown in the cut, on a board each quarter of which is marked with six lines, alternately white and black or red and black. Each of these quarters is called a table; those marked A and B, in which the game begins, are the inner tables, the others the outer. The number of lines across which a player is allowed to move his men is decided by the dice; and the object of the player having the white men, for instance, is to move those of his men which are in his opponent's table (A) through the tables C and D, and finally into his own inner table B; at the same time endeavoring also to bring into that table all his other men, wherever on

Backgammon Board.

the board they may be placed. The player having the black pursues a similar course in moving his men gradually around to his inner table A. Neither player can, no matter what throw he makes with the dice, place his men on a line already occupied by more than one of his opponent's pieces. Should only one of these, however, be found on a line to which he has otherwise the right to move, he can "take up" this solitary man, that is, remove him from the board, and oblige his adversary to begin with him anew in the furthest table from his own inner one. When a player has brought all his men safely into his inner table, he may begin to "throw off" his pieces, that is, remove from the board a man standing on any point the number of which he throws. Should he throw doublets, he may remove four from the point indicated by them. The player who by this means first rids himself of all his men, wins the game. Should he win it before his opponent brings all his men into his inner table, he is said to "gammon" him; if before

the latter even has all the men out of his first table, to "backgammon" him.

BACKHUYSEN, or *Bakhuysen*, **Ludolf**, a Dutch marine painter, born at Emden in 1681, died in Amsterdam in 1709. While a merchant's clerk in Amsterdam his fondness for shipping led him frequently to the port, where he made admirable drawings. He went out to sea during storms, and on landing immediately transferred his impressions to canvas. The czar Peter frequently visited Backhuysen's studio, and endeavored to make drawings of vessels which the artist had designed. His most celebrated sea picture, with a multitude of vessels, and a view of Amsterdam in the distance, is in the Louvre, together with seven other pictures by him.—His grandson, of the same name, a merchant and soldier, and finally a painter of horses and battles, born Aug. 29, 1717, died in Rotterdam, April 16, 1782.

BACKUS, **Isaac**, an American Baptist clergyman, born at Norwich, Conn., in 1724, died Nov. 20, 1806. He left the Congregational church for the Separatists, derisively styled "New Lights," a secession from the "standing order" on grounds connected with controversies that grew out of the great revival under Edwards and Whitefield. The Separatists largely sympathized with the Baptists, among whom Mr. Backus became a leader. To his exertions the Baptist denomination in America is largely indebted for its prosperity. He was sent in 1774 as an agent to claim from congress, then in session in Philadelphia, the same liberties for the Baptist that were accorded to other churches. In his writings upon the constitution of the church he advocated the entire separation of the church from the state. He was one of the most voluminous of American Baptist writers, and left a valuable history of that denomination, of which a new edition, edited by the Rev. David Weston, was published in 1871, under the auspices of the "Backus Historical Society."

BACLER D'ALBE, **Louis Albert Ghislain**, baron de, a French painter, born at St. Pol, Oct. 21, 1762, died at Sèvres, Sept. 12, 1824. He is celebrated for his views of Swiss scenery, remarkable for a knowledge of natural history and topography. He fought at Arcola, and his picture of that battle is regarded as his master-work. He accompanied Napoleon in many campaigns, sketching the movements of the troops. His illustrated works comprise *Souvenirs pittoresques* of Switzerland, of the Italian and Spanish campaigns, and of Paris and its environs. He also painted classical subjects. He was appointed brigadier general in 1813, and subsequently director of the war depots in Paris, but lost this office in 1815.

BACOLOR, a town of the Philippines, capital of the province of Pampanga in the island of Luzon, about 38 m. N. W. of Manila, near the Pampanga river; pop. about 8,500. During the British occupation of Manila (1762-'4) it was the capital of the Philippine Islands.

BACON, **Anne**, the mother of Lord Bacon, born about 1528, died in 1600. She was the second daughter of Sir Anthony Cooke, tutor of Edward VI., who imparted to her and her three sisters (respectively married to Lord Burleigh, Sir John Russell, and Sir Henry Killigrew) a remarkable degree of classical and theological learning. She prepared excellent translations of Bishop Jewell's *Apologia* and of Ochinus's 14 Italian sermons. Beza dedicated his "Meditations" to her, and she was regarded as one of the most accomplished and pious women of her day. She became the second wife of Sir Nicholas Bacon, to whom she bore two children, Anthony and the celebrated Francis.

BACON, **Francis**, Viscount St. Albans and Baron Verulam, an English philosopher and lord chancellor, born at York house, in the Strand, London, Jan. 22, 1561, died at Highgate, April 9, 1626. He was the youngest son of Sir Nicholas Bacon. Early in life he gave signs of great fertility of talent. His health was exceedingly delicate, so that he was often affected to fainting by slight atmospheric changes. This constitutional infirmity accompanied him even to his latest days. Nothing is known of the process of his education, except that, as both his parents were learned persons, in the highest walks of life, he must have been early accustomed to study, and he did not miss the lessons of the courtly society by which he was surrounded. When Queen Elizabeth asked him, yet a child, how old he was, he replied, "Two years younger than your majesty's happy reign." In his 11th year he speculated on the laws of the imagination. A year later he was sent to Trinity college, Cambridge, where he was matriculated at the same time with his brother Anthony, June 10, 1573. As a student he was diligent and laborious, but thought for himself, and before he was 16 had already conceived a dislike for the philosophy of Aristotle, still greatly in vogue at the university. "They learn nothing at the universities," he afterward said, in the "Praise of Knowledge," "but to believe. They are like a becalmed ship; they never move but by the wind of other men's breath, and have no oars of their own to steer withal." Some years after he quitted Cambridge he published a tract on the defects of universities, in which, after having premised that colleges were established for the communication of the knowledge of our predecessors, he proposed that a college be appropriated to the discovery of new truth, "to mix, like a living spring, with the stagnant waters." These sentiments he adhered to all his life, for in his will he endowed two lectures, in either of the universities, "by a lecturer, whether stranger or English, provided he is not professed in divinity, law, or physic." And in one of his latest works, the unfinished philosophical romance called "New Atlantis," he developed at considerable length the idea of a college for the "interpreting of nature," under the name of the "college of the six days' works." At the close

of his collegiate course his father sent him to Paris, under the care of Sir Amyas Paulet, the English ambassador at that court, by whom he was shortly after intrusted with a mission to the queen. He then travelled in the French provinces, spending some time at Poitiers, where he prepared a work upon ciphers, and also one upon the state of Europe; but his father dying (1579) while he was engaged upon them, he instantly returned to England. He applied for an office, which he failed to get, when he entered as a student of law in Gray's Inn (1580). On June 27, 1582, he was called to the bar; in 1586 he was made a bencher, and in 1590, when he was but 28, counsel extraordinary to the queen—"a grace," says his biographer Rawley, "scarce known before." At that time the court was divided into two parties, of which one was headed by the two Cecils, and the other by the earl of Leicester, and afterward by his son-in-law, the earl of Essex. Bacon was allied to the Cecils, being a nephew of Lord Burleigh, and first cousin to Sir Robert Cecil, the principal secretary of state; and yet his affections lay with Essex. His advancement, however, did not correspond either with his abilities or his connections. The Cecils represented him as rather a speculative man, not fitted for business. After renewed solicitations they procured for him the reversion of the registrar of the star chamber, with about £1,600 a year, but he did not come into possession of it for 20 years. In 1598 he was returned to parliament as a knight of Middlesex. His first speech there was delivered in favor of his plan for the improvement of the law; another speech related to the postponement of certain subsidies which created popular discontent, whereby he provoked the anger of the queen; and being remonstrated with, he replied that he "spoke in discharge of his conscience and duty to God, to the queen, and to his country"—a noble reply, which he did not himself always in after life remember. Ben Jonson compliments his parliamentary eloquence highly, alleging that "no man ever spake more neatly, more pressly, more weightily, or suffered less emptiness, less idleness in what he uttered; no member of his speech but consisted of its own graces. His hearers could not cough or look aside from him without loss; he commanded when he spoke, and had his judges angry or pleased at his devotion. The fear of every man that heard him was lest he should make an end." In the spring of 1594 the solicitorship became vacant, by the promotion of Sir Edward Coke to the office of attorney general, and Bacon applied for it, strenuously backed by Essex; but he did not succeed, the superior influence of the Cecils being against him. Essex, however, as some compensation for his disappointment, made him a present of Twickenham court, worth about £1,800, and so beautiful that Bacon called it the garden of paradise. It is worthy of remark that Elizabeth rejected the official claims of Bacon on the ground that

although he was a man of wit and learning, he was yet "not very deep." During this year Bacon published his first political tract, entitled "A Declaration of the Causes of the Great Troubles," a vindication of the course of England in respect to continental policy. Three years later (1597) he issued a small 12mo called "Essays, Religious Meditations, and a Table of the Colors of Good and Evil." It contained but 10 essays in all, of which he says that he hopes they will be "like the late new halfpence, which, though the pieces are small, the silver is good." Abounding in condensed and practical thought, expressed with much simplicity, and without much imagery, they yet evinced a mind of wonderful sagacity and comprehensive reach. They were translated almost immediately into French, Italian, and Latin, and have proved, as subsequently augmented both in number and length, the most popular of his writings. Dugald Stewart has properly remarked of the book that "it may be read from beginning to end in a few hours, and yet, after the twentieth reading, one seldom fails to remark in it something overlooked before." Dr. Whately published in 1857 a new edition, with an excellent introduction and many valuable notes. By Bacon's contemporaries it was gratefully received.—Bacon's pecuniary affairs at this time were in a wretched state; in order to retrieve them he twice tried to form lucrative matrimonial connections; but these plans also miscarried, and he was twice arrested for debt. Early in 1599 a large body of the Irish, denied the protection of the laws, and hunted like wild beasts by an insolent soldiery, fled the neighborhood of cities, sheltered themselves in their marshes and forests, and grew every day more intractable and dangerous. It became necessary to subdue them, and Essex was appointed lord lieutenant of Ireland; but his conduct in his office was so rash and haughty that Bacon, after vainly remonstrating with him, was at length compelled to turn against him. By this means he lost the aid of that powerful noble, without making either very many or very sincere friends on the other side. His conduct in respect to Essex, who was tried and condemned for his offences in the year 1600, exposed Bacon to the charge of ingratitude and double-faced friendship; and though Mr. Basil Montagu, in his life of Bacon, labored hard, and to some degree justly, to acquit him of the obloquy with which he was then visited, he has scarcely escaped all blame in the judgment of posterity. Bacon not only appeared in the court against the man who had been his benefactor and friend, but, in pursuit of the good will of the queen, he used all his skill as a lawyer to heighten the guilt of his crime. He did not, however, gain much from his fidelity to this sovereign, who either did not discern or wilfully neglected his merits. On the accession of James in 1603 he had everything to expect from the disposition of that monarch, who was a lover of letters, and desired to dis-

tinguish himself as a patron of learning. Bacon possessed the additional title to his favor that his eloquence and information gave him great weight in parliament. Appointed by the house on the committee to make a representation of the misconduct of the royal purveyors, he discharged the task with so much discretion that while he satisfied the king, he won from the house a vote of thanks. James made him one of his counsel, an office to which a small pension was attached, and from that time he continued to rise in spite of the opposition of the Cecils, and the rivalry of Sir Edward Coke, the attorney general. In 1607 he was made solicitor general, by which his practice in Westminster hall was rapidly extended. About the same time he married Alice, daughter of Benedict Barnham, a wealthy alderman of London—thus succeeding in his third attempt at a wealthy marriage. His tact, his knowledge, and his eloquence combined, raised him to the highest point of reputation in the commons, while his standing at the bar was every day confirmed, and his favor at court was increased. But these political and personal struggles did not separate him from those philosophical inquiries which were the first love of his heart. In 1605 he published "The Advancement of Learning" (subsequently expanded into the *De Augmentis*), a work which inaugurated an era in the history of English literature and science. It professed to be a survey of existing knowledge, with a description of the parts of science yet unexplored, and might be regarded as a picture both of the cultivated parts of the intellectual world, and of its outlying, untrodden deserts. This work alone would have been sufficient to place Bacon among the intellectual giants of his race. Yet his active and vigorous mind continued to busy itself with other speculations; besides his many speeches in the commons and his arguments at the bar, he wrote numerous tracts, such as "A Discourse on the Happy Union," "An Advertisement touching the Controversy of the Church of England," and pamphlets upon law reform and other topics of prevalent interest. All the while he was also employed in meditating the great *Novum Organum Scientiarum*, of which sketches were prepared in the shape of his *Cogitata et Visa*, *Filum Labyrinthi*, and *Temporis Partus Maximus*. His lesser writings he undertook, as he says, to secure him a degree of respect and consideration in the general mind, which might afterward serve to conciliate it toward the peculiarity of his opinions, or to answer as a bulwark against unfriendly assaults. In this intention he wrote and sent forth in 1609 "The Wisdom of the Ancients," a book in which the classical fables are made the vehicles of original and striking thoughts, clothed in remarkable beauty of language, and ornamented with graceful figures. Meantime his political advancement went steadily forward. In 1611 he was a joint judge of the knight marshal's court; and the next year he

was appointed attorney general, and elected a member of the privy council. While he held the office of attorney general he was engaged in several important causes. He was the prosecutor of Oliver St. John, of Owen Talbot, and of the old clergyman Peacham, who was indicted for the treason contained in a sermon which was never preached. It is said that he was examined in the Tower under torture, and that Bacon was present assisting at the operation. It is a curious fact that the founder of modern philosophy should have consented to the barbarous system of extorting evidence by the rack. A more important trial was that of the earl and countess of Somerset and their accomplices for the murder of Sir Thomas Overbury, in the conduct of which he earned the highest distinction. The pecuniary embarrassments under which he once suffered were of course now at an end. His professional practice was large; the office of attorney general was worth £6,000 per annum; as registrar of the star chamber he was entitled to £1,600 per annum; his father's seat at Gorhambury had passed to him in consequence of the death of his brother; and he was also possessed of a considerable estate in Hertfordshire, besides the fortune acquired through his wife. In 1616 Bacon relinquished the bar, but retained his chamber practice. In the spring of the following year the lord chancellor, Ellesmere, resigned the seals, which were handed over to Bacon, with the title of lord keeper. In January, 1618, he was created lord high chancellor, and the same year was raised to the peerage as baron of Verulam. His higher title of Viscount St. Albans was not conferred upon him till 1621. Bacon entered upon his judicial duties with elaborate pomp, and delivered a long and eloquent speech in the presence of the judges and the nobility.—The *Novum Organum*, the great restoration of the sciences, which had been the burden of the thoughts of his life, was first printed in October, 1620. Twelve times it had been copied and revised before it assumed the shape in which it was committed to posterity. The full title of Bacon's work was the *Novum Organum sive Indicia Vera de Interpretatione Naturæ, et Regno Hominis*, and the title sums up its principal object. He proposed to replace the scholastic logic represented in the *Organon* of Aristotle by a new organon, in which the true and solid principle of investigating nature should supplant the old principle of mere verbal dialectics, and lead to "fruit" in the shape of genuine knowledge. It was written in Latin, because it was addressed especially to the learned men of Europe, and in axioms, or short pithy sentences, that it might strike upon their minds by its repetitions, and be easily engraved upon the memory. It is yet, however, but a part of a larger work—of that *Instauratio Magna*—in which he designed to rehabilitate not only the methods of science, but science itself, and of which the *De Augmentis* was an opening

chapter, and the whole of modern discovery the completion. Bacon's leading thought was the good of humanity. He held that study, instead of employing itself in wearisome and sterile speculations, should be engaged in mastering the secrets of nature and life, and in applying them to human use. His method in the attainment of this end was rigid and pure observation, aided by experiment, and fructified by induction. Instead of hypotheses he asked for facts, gathered laboriously from the watch of nature's silent revolutions, or extorted skillfully by instruments and trials, and carried forward by careful generalizations from the world of the known to the unknown. From effects to causes, and not from causes to effects, was the spirit of his recommendations. And that he might not mislead any one by mere general views, Bacon constructed the new logic of observation and induction, and sought to exemplify it in numerous instances. It is in this latter process that he has the least succeeded; but it would be unjust to judge of Bacon's system by its failures. He did not propose to himself in the *Novum Organum* to make discoveries, but simply to cause them to be made, or to teach the art by which they could be made. He compared himself to those statues of Mercury which indicate the way although they do not pass over it themselves, or to a trumpet which sounds the charge while it takes no part in the battle. Yet even in this, the least happy part of his work, Bacon exhibits a fine scientific sense, and anticipates discoveries reserved as the reward of later research. He clearly, for instance, invented a thermometer (l. ii. aph. 13); he instituted ingenious experiments on the compressibility of bodies, and on the density and weight of air; he suggests chemical processes (aph. 48); he suspected the law of universal attraction (aph. 35, 36, and 45), afterward demonstrated by Newton; he foresaw the true explication of the tides (aph. 45, 48), and the cause of colors, which he ascribes to the manner in which bodies, owing to their different texture, reflect the rays of light. Nor did Bacon, as some have wrongly supposed, confine his method to the natural sciences alone; he clearly intended its use in psychological investigations as well; and the metaphysics of the Scotch school are an attempt to render mental science according to his rules. This immense and unprecedented book was received with admiration by a discerning few, but with ridicule and scorn by the would-be wits and geniuses. Bacon's old enemy Coke wrote upon the title page of a presentation copy, having the device of a ship passing the pillars of Hercules,

"It deserveth not to be read in schools,
But to be freighted in the ship of fools."

Others said that he wrote of philosophy like a lord chancellor. King James, in his pedantic conceit, compared it to the peace of God, which passeth all understanding. Yet there were some who perceived its truth, among the rest

Ben Jonson and Sir Henry Wotton; the latter of whom, addressing him, said, "Your lordship hath done a great and everlasting benefit to all the children of nature, and to nature herself in her uppermost extent of latitude: who never before had so noble and so true an interpreter, never so inward a secretary of her cabinet."—But the glory of Bacon ascended on the eve of a most disgraceful fall. His moral dignity was not on a level with his intellectual penetration. He had a broad, and deep, and vigorous, but not a lofty nature. Giving himself up to improvidence, his need of money betrayed him into practices of corruption. In the house of commons on March 15, 1621, Sir Robert Phillips reported from a committee appointed to inquire into the abuses of courts of justice, two cases of corruption against the lord chancellor. One of these was on a petition of a man named Aubrey, who alleged that he had paid Bacon £100 to advance a suit; and another on that of one Egerton, who had given him a gratuity of £400. Before the close of the proceedings, similar cases to the number of 24 were presented. The commons referred the case to the house of peers, as the only tribunal capable of trying the lord chancellor. Bacon resolved to stand up manfully against his accusers; but, his health giving way, he could only write to the lords. He requested that his case should be conducted according to the strictest rules of justice, to which the lords replied that it should be. His friends he assured in the strongest terms of his innocence. In 14 cases it was shown that the presents were given long after the suits were terminated; in other cases the decrees which he rendered had been against the donors; and in other cases the presents were considered not as gifts but as loans, and he had decided against his creditors. Yet, when brought to the test, Bacon submitted to the accusations. His submission, it is alleged, was brought about by the king, who even persuaded Bacon to sacrifice himself to the popular excitement. On April 22, 1621, he wrote to the lords that he abandoned his defence, and moved them to condemn and censure him. The house required that he should furnish categorical answers to the several articles of charge, which he did, saying to each, "I do plainly and ingenuously confess that I am guilty of corruption, and do renounce all defence," &c. A deputation of the lords being appointed to wait on him, to ask if the confession was his, he said: "It is my act, my hand, my heart. I beseech your lordships, be merciful to a broken reed." His humiliation was complete, and his spirit was crushed within him. He hoped that the king, or his son, or their favorite Buckingham, would interfere to stay the sentence; but they refused. On the 3d of May he was sentenced to a fine of £40,000, and to imprisonment in the Tower during the king's pleasure. He was released from imprisonment after two days, and the fine was subsequently remitted; but his disgrace was

final. Once afterward he was summoned to attend parliament; but he never recovered his standing, and he spent the remainder of his days in scientific studies, and among the few friends whom adversity had left him. His "History of Henry VII.," "Apophthegms," some works on natural history, and a new and enlarged edition of the "Essays" (1625), were all that he published after his fall. The imputations on his honor were doubtless exaggerated by the prejudices of the day, but his own confessions force us to believe that they were well founded, or else that he, in base subservieney to the court, subscribed himself a liar. Mr. Basil Montagu, in his life of Bacon, adopts the latter alternative, and argues against his corruption in favor of his weakness. The practice of receiving gifts was an habitual one; and Bacon probably spoke the truth when he averred that he had been the justest chancellor for many years. He died, saying in his will that "my name and memory I leave to foreign nations and to my own countrymen, after some time be passed over."—Lord Bacon had a capacity no less adapted to grapple with the principles of legal science than to illustrate other departments of knowledge. He lived, however, at a time when the English law consisted mostly of barren precedents, and judges were adverse to any reasoning that had not some analogy to cases already decided. The earliest of his writings on law, which he entitled "Elements of the Common Law of England," consisting of two treatises on "Maxims of the Law and the other Uses of the Law," appears to have been written in 1596. It was dedicated to Queen Elizabeth, but he elicited no encouragement to proceed in the work. The "Maxims" exhibit the same nice discrimination of analogies that was afterward shown in his popular treatise on the "Colors of Good and Evil." Bacon says in the preface that he had collected 800 maxims, but that he thought best first to publish some few, that he might from other men's opinions either receive approbation in his course, or advice for the altering of those which remain. He received neither. The "Maxims" expounded were but 24 in number, and all the residue were by this cold reception lost to the world. Few cases are cited from the books, for which he gives the reason that it will appear to those who are learned in the laws that his instances "are mostly judged cases, or sustained by similitude of reason, but that in some cases he intended to weigh down authorities by evidence of reason, and therein rather to correct the law than either to soothe a received error, or by unprofitable subtlety, which corrupteth the sense of the law, to reconcile contrarieties." It is a common remark that he was not equal to some others, particularly Sir Edward Coke, in applying and reasoning from cases, but it is entirely untrue if by that be meant less discrimination of adjudged cases. On the contrary, no man excelled him in exact judgment of authorities;

but often he found these authorities unsupported by just principles, or so conflicting that the rule was to be sought from reasoning, independent of reported cases. Sixteen years later, when he had become attorney general, he again referred to this subject in "A Proposal for Amending the Laws of England," a tract addressed to King James, in which he speaks of the method of expounding the laws upon the plan which he had attempted in his early treatises, as certain to be productive of great advantage, and professes his willingness to resume his labors if desired by the king to do so. The king, however, did not accept the proposal. During the five years that he survived his impeachment and removal from office, Bacon again recurred to this favorite project, or rather he seems never to have laid it aside. A treatise on universal justice, consisting of 97 aphorisms, is contained in the *De Augmentis*, published during that period, which, he says, he wishes "to serve as a specimen of that digest which we propose and have in hand." The digest referred to is explained in an offer addressed to the king about that time. The plan he had in view was somewhat different from that which he had formerly proposed. It was to arrange into some order all the laws, whether statute or common law. The offer met with the same fate as the preceding one. Bacon says, in a letter to Bishop Andrews: "I had a purpose to make a particular digest or recompilment of the laws of mine own nation; yet because it is a work of assistance and that which I cannot master by my own forces and pen, I have laid it aside." Of his other law writings, the "Readings on the Statute of Uses" is the most elaborate. It has now no practical value, in consequence of the change in the laws wrought by time, but it is esteemed by those who have examined it critically a very profound treatise.—Bacon's life has been written by the Rev. William Rawley, who was his secretary and chaplain (London, 1658); by W. Dugdale, in the "Baconiana" of Thomas Tenison (1679); by Robert Stephens (1734); by David Mallet, at the head of an edition of his works (1740); by M. de Vauzelles (Paris, 1833); and by William Hepworth Dixon, "Personal History of Lord Bacon" (London, 1859). The best and most complete edition of his works is that of Spedding, Ellis, and Heath (London, 1857). Basil Montagu's edition (1825-'34) was the occasion of Macaulay's famous essay on Lord Bacon. *Bacon, sa vie et son influence*, by Rémusat (Paris, 1857), is a valuable work. An important monograph on Lord Bacon, entitled *Frans Bacon con Verulam*, by Kuno Fischer, was published in Leipsic in 1856.

BACON, John, an English sculptor, born at Southwark, Nov. 24, 1740, died Aug. 7, 1799. He was apprenticed at an early age to a porcelain manufacturer, in whose employment he learned the art of painting on china, and also of making ornamental figures in that material. At the age of 18 he sent a small

figure of Peace to the society for the encouragement of arts, and received a premium of ten guineas. On nine successive occasions he carried off similar prizes from the society. Bacon was employed at Lambeth to make statues of artificial stone, an art which he did much to develop and render popular. On the opening of the royal academy in 1768 he became one of its students, and the next year gained the first gold medal for sculpture. In 1770 he was chosen an associate of that body. His principal works were two busts of George III.; a monument to the founder of Guy's hospital, Southwark; a monument to Lord Chatham, in Guildhall; a monument to Lord Halifax, in Westminster abbey; the statue of Blackstone in All Souls college, Oxford; a statue of Henry VI. for the ante-chapel at Eton; a recumbent figure of the Thames, in the courtyard of Somerset House; the statues of Howard and Johnson in St. Paul's cathedral; and a second monument of Chatham in Westminster abbey.

BACON, Leonard, D. D., an American clergyman, born in Detroit, Mich., Feb. 19, 1802. He was educated at Yale college and at Andover theological seminary, and in March, 1825, became pastor of the first Congregational church in New Haven, Conn., which position he held till September, 1866, when he withdrew from active pastoral duty. From 1866 to 1871 he was acting professor of revealed theology in Yale college; and since 1871 has been lecturer there on ecclesiastical polity and American church history. From about 1826 to 1838 he was one of the editors of the "Christian Spectator," a religious magazine published at New Haven. In 1843 he aided in establishing the "New Englander," a bi-monthly periodical, with which he is still associated. From 1843 to 1863 he was one of the editors of "The Independent" newspaper of New York. Among his works are: "Life of Richard Baxter" (1830); "Manual for Young Church Members" (1833); "Thirteen Historical Discourses, on the Completion of Two Hundred Years from the Beginning of the First Church in New Haven" (1839); "Slavery Discussed in Occasional Essays from 1833 to 1838" (1846); "Christian Self-Culture" (1863); "Introductory Essay" to Conybeare and Howson's "Life and Epistles of St. Paul" (1868); and many addresses before colleges which have been separately published.—His sister **DELIA**, born in 1811, was eminent as a teacher, and author of "Tales of the Puritans" (1830), "The Bride of Fort Edward" (1839), and "The Philosophy of Shakespeare's Plays" (1857), in which she attempted to show that Francis Bacon was their author. She resided for some time in Stratford-on-Avon, and died in Hartford in August, 1859.

BACON, Nathaniel, commonly called the Virginia rebel, born in London about 1680, died in January, 1677. He emigrated to Virginia in 1675, during the administration of Sir William Berkeley. His abilities as a lawyer, his wealth and popular deportment, gave him

great influence. Almost immediately after his arrival he was chosen a member of the governor's council. At that time the colony was distracted by discontents. Gov. Berkeley was highly unpopular on account of his inefficiency in protecting the settlers from Indian ravages, his disposition to restrict the franchise, and the high rate of taxes. When the people took arms ostensibly to repel the savages, but in reality to force the authorities to do their duty, Bacon became the leader of the movement in July, 1676. Berkeley was compelled to make concessions, dismantle the forts, dissolve the old assembly, and issue writs for a new election. But he did not keep faith with the insurgents, and a desultory civil war broke out, in the course of which Jamestown, the capital of the colony, was burned to the ground. In the end the governor was obliged to seek shelter in some English vessels lying in James river, but before Bacon could complete his plans in respect to a new government he died of a disease contracted during one of his Indian campaigns. Soon after his death the rebellion itself was extinguished.

BACON, Sir Nicholas, an English statesman, lord keeper of the seal during the first 20 years of the reign of Queen Elizabeth, born at Chislehurst, Kent, in 1510, died Feb. 20, 1579. He studied at Corpus Christi, Cambridge, and afterward in Paris. Soon after his return to England he was called to the bar, and in 1537 was appointed solicitor to the court of augmentations. Nine years later Henry VIII. made him attorney to the court of wards, an office in which he continued during the reign of Edward VI. Being a Protestant, he was excluded from favor under Mary; but on the accession of Elizabeth (1558) he was chosen to her privy council, and soon afterward received the great seal, with the rank of lord chancellor. At the public conference held in Westminster abbey in March, 1559, to discuss the doctrines and ceremonies of the church of Rome, he presided. Being suspected in 1564 of having a hand in a book published by one Hales which questioned the title of Mary, queen of Scots, to succeed Elizabeth—a view of the case not then held by the court—he was dismissed from the privy council, and from all participation in public affairs except in the court of chancery. Through the efforts of his brother-in-law Cecil he was afterward restored to favor. He was the father of Sir Francis Bacon.

BACON, Roger, an English Franciscan scholar, born near Ilchester, Somersetshire, in 1214, died at Oxford in 1292 or 1294. At an early age he was sent to Oxford, and thence he went to the university of Paris, then the most famous in Europe, where he took the degree of doctor of theology. About 1240 he returned to Oxford and entered a Franciscan monastery, where he studied Aristotle and all the ancient scholastic philosophy, mathematica, physica, and astronomy, and made many experiments with instruments constructed by himself. The igno-

rance and jealousy of the other monks and of the clergy in general, and hostility created by Bacon's denunciation of their immorality, led to his being accused of studying and practising magic; and his lectures at Oxford were prohibited and the circulation of his writings confined to the convent. Robert Grosseteste, the bishop of Lincoln, befriended Bacon; and in 1265, when Clement IV., who had been a cardinal legate in England, was raised to the papacy, he despatched Raymond de Loudun to the Franciscan monk to procure some of his writings. Bacon sent him the *Opus Majus*, together with two other supplementary works, the *Opus Minus* and the *Opus Tertium*. It is not known what reception Clement gave them, but he had scarcely got them in hand when he died, 1268. For ten years thereafter Bacon was allowed to prosecute his studies in peace; but in 1278 Jerome of Ascoli, superior of the Franciscan order, and afterward pope under the name of Nicholas IV., was appointed legate to the court of France, and was induced to summon Bacon to Paris, where a council of Franciscans condemned his writings and sentenced him to be confined to his cell. He was then in his 64th year, and ten years he passed in confinement. Finally his release was obtained through the influence of prominent persons in England, though some authorities state that he died in prison. Bayle and others reckon 101 of his treatises on various subjects. His chief printed works are: *Perspectiva* (Frankfort, 1614); *Speculum Alchimie* (Nuremberg, 1581); *De Secretis Artis et Naturae Operibus* (Paris, 1542); *De Retardandis Senectutis Accidentibus* (Oxford, 1590); and the *Opus Majus*, edited by Dr. Jebb (London, 1738), which contains a digest of his writings, and is the principal monument of his fame. Manuscripts of his works exist in the Cottonian, Harleian, Bodleian, and Trinity college libraries. A second manuscript of the *Opus Tertium* was found in the library at Douay by Victor Cousin, who gave an account of it, with an elaborate criticism of Bacon and his philosophical character in the *Journal des savants* for 1848. Roger Bacon claims for human reason the right to exercise control over all the doctrines submitted to its approbation; he insists upon the dignity and importance of all the sciences, and establishes experience rather than reasoning as the proper method of research. He fell into many errors on the subject of alchemy and astrology, but his scientific genius was wonderful for his time. His writings anticipate (according to some authorities) the discovery of the telescope; he was acquainted with the composition of gunpowder; and the whole tone of his mind and scope of his thought were two or three centuries in advance of his generation.

BÁCS, or **Bácska**, a county in southern Hungary, surrounded on three sides by the Danube and Theiss; area, 3,972 sq. m.; pop. in 1870, 576,149. The county is mostly level, and, with

the exception of a few barren tracts, is noted for its great fertility and splendid pastures. It produces wheat of the best quality, wine, tobacco, and fine cattle and horses. The interior is traversed by the Francis canal, near which Zombor, the capital, is situated. Other important towns are Szabadka or Maria-Theresiopel, on the railroad uniting Zombor with Szegedin, and Neusatz, on the Danube. The population consists chiefly of Magyars, Germans, and Rascians or Serbs. Shortly after the outbreak of the Hungarian revolution in 1848, the county became the principal seat of the Serb rising against the Magyars, and for more than a year witnessed all the horrors of a war of races. After the war it formed with the Banat the Serb waywodeship (Voivodina), but has since been restored to its former status. —**Bács**, a town in the S. W. part of the county, is situated on a small tributary of the Danube; pop. in 1870, 3,666.

BACSÁNYI, János, a Hungarian poet, born at Tapoleza, in the county of Zala, May 11, 1763, died in Linz, Upper Austria, May 12, 1845. His first work was *A magyarok vitézsége* ("The Valor of the Magyars," Pesth, 1785). He coöperated with Kazinczy in editing the *Magyar Museum*, and with him was implicated in the democratic conspiracy of the abbot Martinovich of 1794, and was sent to prison at the Spielberg, where he was confined about two years. Having married the German poetess Gabriele Baumberg and settled in Vienna, he was obliged to leave that city in 1809 for translating Napoleon's proclamation to the Hungarians, and took refuge in Paris. He was delivered up to the Austrian authorities after the peace of 1811, and kept under surveillance in Linz. He published his collected poems at Pesth in 1827 and at Buda in 1835.

BACTERIUM, a minute and exceedingly low vegetable form or monad, liable to appear in any fluid or solid substance containing vitalized matters. It is a mere point of organized matter, highly refractive, spherical in form, and moves with considerable activity. The first forms of living organisms, which M. Béchamp called microzymas, have been found in chalk, and are among the smallest living beings that can be seen. They are found also in concentrated alkaline solutions, in all the tissues of organic beings, in various morbid products, in the sugar-producing cells of the liver, in the blood of man and animals, in the liquids of the eggs, larvae, and perfect form of insects, in the sap of plants, and very extensively, if not universally, in the vegetable and animal kingdoms. They act as powerful organic ferments, as vegetable cells, in the transformation of cane sugar and fecula into glucose. They are derived from the air, in which the germs are in suspension, and undergo various degrees of development before they begin to act as ferments. They undoubtedly play a very important part in both healthy and morbid processes; they assist in the ripening of fruits, in elabo-

rating certain matters for the nourishment of germs, in the constant regeneration of animal and vegetable organs, and in the formation and action of cells. They may, according to Béchamp, develop themselves and grow equally well in an acid, alkaline, or neutral medium. The normal microzymas, or organic granules, or molecular granulations, as they are called, in plants and animals, may develop into bacteria, and many forms of both may exist in the same plant. The inoculation of bacterium in a plant or animal causes their increased number, not by multiplication, but by so modifying the medium that the normal microzymas more readily develop themselves into bacterium. Many of the phenomena of spontaneous generation find their explanation in these all-pervading and minute organisms. According to Bastian, while some of these monads originate by subdivision of preëxisting individuals (homogenesis), others originate *de novo*, just as crystals by certain chemical laws. He thus goes further than those advocates of spontaneous generation who believe that bacteria originate by transformation of living matter (heterogenesis); for his mode of spontaneous generation he proposes the name of *archebiosis*. Torulae are very similar bodies, and are the germs of the yeast of fungus. Some bacteria also may develop into fungi. (See YEAST PLANT.)

BACTRIA, or *Bactriana*, an ancient country of Asia, bounded S. and S. E. by the Paropamisus (Hindoo Koosh) and N. by the Oxus, and corresponding to the modern territories of S. Bokhara, Balkh, and Khoondooz. It was inhabited by a warlike people, akin to the Medes and Persians, and generally regarded as belonging to the original stock of the Aryan or Indo-European races. Zend was the language of the country. Bactra, or Zariaspe, its capital, which occupied the site of the modern Balkh, was the headquarters of the Magi and a centre for the ancient Persian worship. Bactria was in very early times a powerful kingdom, but became a province of Persia about the time of Cyrus. It was conquered by Alexander, who left a colony of 14,000

*Bactrian Gold Coin of King Apollodorus, B. C. 200-224.
(In the Cabinet of France.)*

Greeks there, and after his death it formed a part of the dominions of the Seleucids. About 255 B. C. its governor, Diodotus or Tho-

odotus, revolted, and it was an independent Greek kingdom, with some dependencies or affiliated realms toward India, from that time till about 126 B. C., when it was conquered by the Parthians. It was overrun by Genghis Khan and Tamerlane in the 13th and 14th centuries. A good deal of light was thrown upon the history of Bactria by the discovery in 1824 by Col. Tod of a large number of ancient coins in the *topes* or burial places of Afghanistan. The names of kings and inscriptions in Greek or Zend are found on these, which have been closely studied by Prinsep, H. H. Wilson, Lassen, and other scholars. They are in the London and Paris museums.

BÄCKHO, Ludwig von, a German author, born at Lyck, East Prussia, June 8, 1756, died in Königsberg, March 27, 1823. He became blind in his 21st year, from an attack of small-pox, and in 1816 was made superintendent of the blind asylum at Königsberg. Among his works are a history of Prussia in 6 volumes, and a history of the French revolution. He wrote also several romances and dramas.

BADAJOZ. I. A province of Spain, in Estremadura, bordering on Portugal; area, 8,687 sq. m.; pop. in 1867, 430,049. It has a diversified surface, broken by several mountain ranges, is well wooded, and includes many alluvial lands of remarkable fertility, though agriculture is backward. The Guadiana traverses the province from E. to W. The climate is hot and unhealthy. There are mines of lead, copper, silver, and quicksilver, and one of gold. Linen, leather, and soap are the principal manufactures. Among the most noted towns, besides the capital, are Merida, Zafra, and the fortresses Albuquerque and Olivença, near the Portuguese frontier. II. A fortified town (anc. *Pas Augusta*, corrupted by the Moors to *Paragouza*, whence Badajoz), capital of the preceding province, and of Estremadura, on the left bank of the Guadiana, 5 m. from the frontier of Portugal, and 203 m. S. W. of Madrid; pop. in 1867, 22,895. It is built on a hill nearly 800 ft. high, crowned with the ruins of a Moorish castle. On the land side the city is protected by a wall flanked with bastions, around which are a moat and outworks, and on the heights beyond several forts. The river is here crossed by a magnificent stone bridge of 28 arches, originally built in the 15th century. There are many Moorish remains, including a mosque. The cathedral was begun by Alfonso the Wise, and contains several paintings by Morales. There were formerly eight monasteries and convents, but the buildings are now occupied for other purposes. Badajoz has manufactories of soap and coarse cloth, and carries on an active trade with Portugal. The frontier position of the town and its strong defences have made it a conspicuous object of attack in the numerous wars in Spain. It was taken from the Moors by Alfonso IX., king of Leon, in 1230. It was besieged by the Portuguese

without success in 1660, and again during the war of the succession in 1705. During the French invasion it was besieged by Kellermann and Victor in 1808 and 1809, and was surrendered to Marshal Soult March 11, 1811, by the treachery of Imax, commander of the garrison. Borenford made an unsuccessful attempt to recover it, and it was afterward besieged by Wellington, and carried by assault with fearful loss on the night of April 8, 1812. The city was sacked for two days and nights by the British soldiers. Wellington's loss during the 20 days' siege was 5,000, of whom 2,500 fell in the final assault.

BADAKHSHAN, a mountainous country of Central Asia, subject to the Uzbek chief of Koondooz, situated between lat. 36° and 38° N., and lon. 69° and 73° E., bounded N. by Khokan, E. by the table land of Pamir, S. by Chitral and Kafiristan, and W. by Koondooz; area estimated at 40,000 sq. m.; pop. about 500,000. The country belongs to the basin of the Oxus or Amoo Darya, and is very uneven, with a gradual slope to the west. The principal valleys are those of the Amoo and its tributary the Koksha. The lower valleys and plains are fertile, but the mountains are bare and sterile. The highest central range is the Khoja Mohammed, the peaks of which reach an altitude of 7,000 ft. above the sea, or from 3,000 to 4,000 above the surrounding plains. In the east and south the mountains are higher and more rugged. They are composed largely of limestone, containing lapis lazuli. Rubies are found in crystal deposits. The inhabitants are Tajiks, who speak the Persian language and belong to the Shiah sect of Mohammedans. Badakhshan was a dependency of the Mogul empire, and after its fall paid a doubtful allegiance to Onbool. In 1828 it was reduced by the Uzbeks of Koondooz. Its ancient capital, Fyzabad, and many other cities and towns were destroyed, and the former still lies in ruins. A large part of the people were slaughtered or sold into slavery, and in many fertile districts the population is still very thin. The present capital, Jerm, on the left bank of the Koksha, 105 m. E. of Koondooz, is made up of several scattered hamlets, with about 1,500 inhabitants.

BADEN, a grand duchy of Germany, situated between lat. $47^{\circ} 30'$ and $49^{\circ} 50'$ N., and lon. $7^{\circ} 30'$ and $9^{\circ} 50'$ E., bounded N. by Hesse-Darmstadt and Bavaria, E. by Wurtemberg and the Prussian province of Hohenzollern, S. by Switzerland, and W. by Rhenish Bavaria and Alsace; area, 5,910 sq. m.; pop. in 1867, 1,484,970, of whom 981,007 were set down as Catholics, 475,916 Protestants, 2,435 other Christian sects, 25,599 Jews; pop. in 1871, 1,461,428. In 1816 the population was 1,005,899; it increased about 10,000 a year till 1840, after which, owing to emigration, there was a period of decrease till 1855, since which time there has been a gradual increase. It is divided into the administrative districts of Constance, Freiburg, Carlsruhe,

The capital is Carlsruhe, which in 1871 had 84,622 inhabitants. The most important commercial city is Mannheim, with 89,614 inhabitants; and the most renowned cities are Heidelberg, the seat of a celebrated university, and Baden-Baden, the famous watering place.—On the western side of Baden, and stretching along the Rhine, is a fertile strip of land, from which the rest of the country rises toward the east. In the southern and eastern parts is the Schwarzwald (Black Forest), extending northward to the Enz, an affluent of the Neckar. North of the latter river is the Odenwald mountain range, connected by ranges of hills with the Schwarzwald, but much less elevated. The highest peaks of the Black Forest are the Feldberg, 4,789 ft., and the Belchen, 4,490 ft. The highest point of the Odenwald, the Katzenbuckel, is about 2,000 ft. high. Between the Rhine and the little river Dreisam is the Kaiserstuhl, an independent volcanic group nearly 10 m. in length and 5 in breadth; the highest point of this group is 1,784 ft.—The principal river is the Rhine, which forms the boundary of the duchy on the south and west. The other most important rivers are the Neckar, Main, and Elz. The Danube rises in Baden, on the extreme east of the Black Forest, under the name of the Breg. Near Donaueschingen it unites with the Brigach, and with another rivulet from the palace yard of Donaueschingen, when it takes the name of Danube. Baden has a number of small mountain lakes, the Mummel, Titti, &c. A part of Lake Constance belongs to Baden.—In the plains and valleys the climate is mild and agreeable, but in the higher parts it is cold and moist, with snow during the greater part of the year, and with frequently very sudden transitions from winter to summer. But on the whole the climate is very salubrious.—In the valleys and plains the soil yields wheat, maize, barley, beans, potatoes, flax, hemp, and tobacco; in the mountainous district, rye, wheat, and oats are cultivated. The extensive vineyards produce excellent wines, and the finest fruits abound. The manufactures are chiefly confined to iron and hardware, and the spinning and weaving of cotton. The Black Forest is distinguished for manufactures of wooden ornaments and toys, watches, wooden clocks, musical boxes, organs, and basket work. St. Blasien is an important seat of ribbon and cotton manufacture. The fabrication of jewelry and of tobacco and cigars occupies the next rank in importance. The chicory, paper, and cloth manufactures, the tanneries, and breweries are also noticeable. There are extensive government salt works at Durrheim and Rappennau. The most excellent iron mines are those of Oberwert and Kandern. Gold washing, formerly extensively carried on along the Rhine, is now little practised. Baden has more than 60 mineral springs, the most frequented of which are Baden-Baden, Enweiler, Antogast, Rippoltzau, and Ueberm. The exports are wine, timber, bread-

stuffs, hemp, tobacco, fruits, oil, salt, and manufactured articles. The principal imports are colonial produce, southern fruits, medicines, horses, wool, cotton, silk goods, iron, steel, and various articles of luxury. The currency is the Rhenish, 60 kreutzers to the florin or gulden. The weights and measures are according to the decimal system.—There are two universities, one Protestant at Heidelberg, founded in 1386, and one Catholic at Freiburg, founded in 1457. At Pforzheim is an institution for the deaf and dumb, and at Freiburg one for the blind. The Karlsruhe polytechnic school, established about 1832, is one of the best in Germany. The population of the upper Rhine springs from the Alemanni; along the shores of the Murg and the lower Rhine the Frankish race preponderates; the population along the lake shores are of Suevian (Swabian) and Vindelician origin. The character of the people is marked by honesty, industry, and courage; but the population of the Black Forest is most typical of the ancient German character.—The executive government, besides the grand duke, is composed of six departments, the ministers being responsible to the legislature. The legislative authority is vested in a parliament of two chambers, called the first and second. The first chamber, having 81 members in 1878, consists of the princes of the reigning line, the heads of ten noble families, the proprietors of large hereditary landed estates, the Catholic archbishop of Freiburg, the superintendent of the Protestant church, two deputies of the universities, and eight other members appointed for life by the grand duke; the second chamber of 63 representatives, chosen for eight years, 23 from towns and 41 from rural districts. In 1867-'8 the revenue was 22,824,371 florins, the expenditures 22,834,371, showing a deficit of 10,000 florins, a little more than \$4,000. In 1868-'9 there was a deficit of nearly 5,000,000 florins, more than \$2,000,000. The estimates for 1870-'71 showed a probable excess of 465,982 florins, something less than \$200,000. The general public debt on Jan. 1, 1871, was 37,644,083 florins, and the railway debt 118,015,028. There were 590 m. of railway, 977 m. of telegraph, and 487 sailing and steam vessels engaged in the navigation of the Rhine and the Neckar. Military service is obligatory upon all, the period being three years in active service, four in the reserve, and five in the landwehr; the annual contingent is 4,700 men. The actual force in time of peace is 13,695 men of all arms, besides 568 artillerymen garrisoning the fortress of Rastadt, and in time of war may be raised to 48,705.—The southern portions of Baden are supposed to have been originally peopled by Celts, who were dispossessed by Alemanni. The country subsequently formed a part of the Frankish empire. Berthold, a supposed descendant of the Alemannian dukes, was master of the castle of Zähringen, near Freiburg, and the first duke of Zähringen, in the latter half of the 11th cen-

tury. His descendants assumed the title of margraves of Baden, but in 1190 the family was split into two branches, Baden and Hochberg, and other divisions took place afterward, as well as various acquisitions by marriage or purchase. Christopher I., who died in 1527, united most of the possessions of the house, but on his death the margraviate was divided between his two surviving sons, who thus formed the two lines of Baden-Baden and Baden-Durlach. The line of Baden-Baden became extinct by the death of Augustus George in 1771, and its possessions were united with Baden-Durlach, under the long and prosperous reign of the margrave Charles Frederick. By the treaty of Lunéville in 1801, Baden acquired a considerable addition of territory, and was further increased in 1803, when the margrave received the title of prince elector, and by the treaty of Presburg in 1805. In 1806, on the dissolution of the German empire, the elector joined the confederation of the Rhine, and, upon occasion of the marriage of the heir apparent with Stéphanie Beauharnais, received from Napoleon the title of grand duke and 1,950 square miles of additional territory; some smaller additions in 1809 and 1810 increased Baden to its present extent. After the battle of Leipsic in 1813 the grand duchy returned to the German confederation. It then formed a territory of about 5,800 sq. m., with a population of something more than 1,000,000. The public debt was large, and the taxes burdensome; and moreover a strong desire had grown up among the people for a constitutional government. This led to earnest discussions in the chambers, and to some administrative reforms. The revolutionary movements of 1830 produced little effect upon Baden; but after the proclamation of the French republic in 1848 a revolution broke out in Baden, which was soon suppressed. (See HROKER.) In May, 1849, a new revolution expelled the grand duke, set up a provisional government, and was only overcome in July by aid of the armed force of Prussia. (See RASTADT.) In 1852 the grand duke died, and there arose a question as to the succession, which was further complicated by a dispute between the civil power and the Catholic archbishop of Freiburg. The question of succession was finally disposed of, the grand duke Frederick William Louis assuming the authority. He married in 1856 the daughter of the king of Prussia, now emperor of Germany. On the division between North and South Germany in 1866, Baden was forced by its geographical position to side with South Germany, although its sympathies were with Prussia. At the close of 1870 it was incorporated with the German empire. The troops of Baden form the largest part of the 14th German army corps.

BADEN. 1. A town (anc. *Aqua Pannonia*) of Lower Austria, on the river Schwechat, 14 m. S. S. W. of Vienna; pop. in 1869, 10,433. It is a favorite summer resort as a bathing place, having 13 hot sulphur springs. The

town has also dye works, and steel, brass, furniture, and other manufactories. II. A town of Switzerland, in the canton of Aargau, on the Limmat, 18 m. N. E. of Aarau; pop. about 8,000. Its hot sulphur springs were well known to the Romans, who built a castle upon the site where the city now stands. The hottest and most celebrated of the springs is called Verenabad. The rocky heights on each side of the river form a portal through which the Limmat runs. Before the gorge was formed, the country above must have been a considerable lake. The railway passes by a tunnel 800 feet long under the castle hill. Baden from the 15th to the beginning of the 18th century was the seat of the Swiss diet. In the town house of Baden Eugene of Savoy, who acted as representative of the emperor of Austria, signed the final treaty of peace terminating the war of the Spanish succession, Sept. 7, 1714.

BADEN-BADEN, a German watering place, in the grand duchy of Baden, situated on the Oos, at the foot of the Black Forest, 18 m. S. S. W. of Carlsruhe; permanent pop. in 1871, 10,088. There are nearly 80 hot springs, flowing from the rock at the foot of the castle terrace. The waters vary in temperature from 115° to 154° F., and are carried in pipes to the different baths throughout the town. A pint of water from the Ursprung, one of the hottest and most copious of the springs, weighs 7,392 grains, and contains 28.8 grains of solid matter, 16 of which consist of common salt, 6½ of sulphate, muriate, and carbonate of lime, and the remainder of a small portion of magnesia, traces of iron, and about half a cubic inch of carbonic acid gas. The number of visitors to the baths has of late been about 50,000 a year, the season being at its height in July and August. There are numerous hotels and several public baths. The principal place of resort for visitors is the *Con-*

Baden-Baden.

versationshaus, which is surrounded by pleasure grounds and contains an assembly room, restaurant, library and reading room, and the formerly so celebrated gaming tables, the licenses of which expired in 1872, and have not been renewed. The drives and promenades about the town are beautiful. There is a parish church containing the remains of the margraves of Baden, who resided here for several centuries, an English church built in 1867, and a Greek chapel. The remains of Roman vapor baths have been discovered just beneath the new castle. The picturesque ruins of the old castle of the margraves still crown the summit of the Schloesberg, and the new castle, the summer residence of the grand duke, stands lower down on the hill directly overlooking the town. It was founded in 1471, burned by the French in 1688, and subsequently restored.

Beneath are curious dungeons connected with the old Roman baths, and in the upper part are portraits of the Baden family.

BADEN-BADEN, *Ludwig Wilhelm I.*, margrave of, a German general, born in Paris, April 8, 1655, died at Rastadt, Jan. 4, 1707. Louis XIV. was his godfather. He served first under Montecuculi against Turenne, and then under the duke of Lorraine. At the siege of Vienna by the Turks, in 1683, he threw his forces into the city, and by a brilliant sally effected a junction with King Sobieski and the duke of Lorraine, who had come to its relief. In 1689 he defeated the Turks at Nissa, and in 1691 at Salankamen. He also took an active part in the war against France in 1693, and after the death of Sobieski in 1696 aspired to the crown of Poland; but the elector of Saxony was preferred to him. He again commanded in the

campaign of 1702, in the war of the Spanish succession, and took Landau, but was subsequently defeated by Villars at Friedlingen and at Höchstädt. He built the famous lines of Stollhofen from the Black Forest through Bühl and Stollhofen to the Rhine.

BADGER (*meles*, Cuv.), a carnivorous plantigrade quadruped of the order *mammalia*, originally classified with the bears, raccoons, and coatis by Linnaeus, but separated by more recent naturalists. The badgers have 4 false molars in the upper and 8 in the under jaw, 2 and 4 on each side respectively, followed by a carnassier and a single tuberculous tooth of large size. They are the least carnivorous of the family to which they belong, with the single exception of the bears. They have 5 toes, before and behind, deeply buried in the flesh, and provided with powerful, compressed claws, adapted for burrowing in the earth, or digging for roots, which are their principal food. The body is long, flat, and compressed; the head small and flat, with an elongated snout; the legs sturdy and powerful; the tail short. Below the anus there is a slit, from which exudes a very fetid oleaginous matter, similar in character, though not in odor, to that of the civets and genets. The badgers are inoffensive, timid, nocturnal animals, sleeping during the day in their burrows, which are curiously constructed, with a single entrance, but with many different chambers within, terminating in a circular apartment, well lined with dry grass or hay, in which the male dwells alone, eschewing the company even of his female. The badger is a very cleanly animal, carefully removing everything that might become offensive from his dwelling, never depositing his excrements near its entrance, and instantly evacuating it in case of its being polluted by any other animal. The flesh is in some places much esteemed as an article of food, and it is usually very fat. The badger makes a vigorous defence when attacked; and as its bite is terrible, it requires a brave and powerful terrier dog to drag it from its burrow.—The geographical distribution of the badger extends over the whole of Europe, northern and central Asia, and the northern parts of North America. It does not extend into Africa or South America, in the former of which continents it is represented by the rattel (*gulo mellicora*), as it is in the latter by the various kinds of mofette (*mephitis*). In Australia there exists no plantigrade animal of any kind. In the eastern peninsula and the Indian isles the place of the badger is supplied by the telagon (*mydaus meliceps*). This genus contains at the most only three species, and some writers have reduced it to a single one, asserting that the American badger is a mere variety of the European, and the Indian a distinct genus; for neither of which opinions does there appear to be any foundation. 1. The common badger of Europe (*M. vulgaris* or *taxus*) is about the size of a moderately large dog, but longer and fatter in

the body, and lower on the legs. The head is long and pointed, the ears so short as to be concealed by the fur. The tail barely reaches to the mid-thigh. The hair is long and coarse,

Badger (Meles vulgaris).

except that on the belly and breast, which is short and resembles fur. The head is white, with a black chin and two black bands passing backward from the corners of the mouth, including the ears and eyes, and meeting at the nape. Every hair of the upper part of the badger has three distinct colors, yellowish white at the roots, black at the middle, and ash-gray at the top, which gives a uniform sandy gray color to all its upper parts. The throat, breast, belly, and limbs are jet black. The female badger produces three, four, or five young in the early spring, suckles them for about five weeks, and then gradually accustoms them to shift for themselves. When taken early the young cubs are easily domesticated. Badgers are hunted in some parts of England by moonlight, principally for their hides, which, when properly dressed, are held to make the best pistol furniture. Their hair is of great value for shaving brushes and for paint brushes. The hind quarters, when salted, are good eating, but are not much in use in England. In China badgers' hams are a choice dainty. 2. The American badger (*M. Labradorica*) measures about $2\frac{1}{2}$ feet from the snout to the origin of the tail, which extends to

American Badger (Meles Labradorica).

6 inches more. Its head is less attenuated than that of the European species, though equally elongated. The claws of its fore feet are much

longer; its tail is shorter, its fur of a much softer and more silky character, and its colors different. It frequents the sandy plains skirting the foot of the Rocky mountains, so far north as the Peace river, and abounds in the country watered by the Missouri; but its southern and western limits have not been defined. It is a far more carnivorous animal than its European congener, and is also believed to hibernate during the winter months, which habit is not common in either of the other species. It preys on the marmots of the plains, the *spermophilus Hoodii* and *Richardsonii*, and on all the smaller quadrupeds, as field mice and the like, and also feeds on vegetable matters. It extends into Mexico, where it is called *illacoyotl* or *coyotlhumuli*; and very fine specimens have been sent from California. 8. The Indian badger, *balisaur*, or sand bear (*M. or arctonyx collaris*), is about the size of the European badger, but stands much higher on its legs, and is distinguished by its attenuated muzzle, its truncated snout resembling that of a hog, and its short tail. Its body somewhat resembles that

Indian Badger (*Martes collaris*).

of the bear; and when attacked it sits erect like that animal, and seems to possess a similar power in its arms and claws, which are truly formidable. In color and the nature of its fur it closely resembles the European species. The markings of the head are exactly like those of the English badger, but its throat is white, and the black bands from the muzzle to the ear, instead of meeting at the nape, encircle the white of the throat, forming a distinct gorget.

BADIA Y LEBLICH, *Demingo*, a Spanish traveler, known as Ali Bey, born in 1776, died near Aleppo in 1818. He learned Arabic at Valencia and London, and under the name of Ali Bey and in the disguise of a Mussulman spent two years (1808-'5) in Morocco on terms of high favor with the emperor. He then made a pilgrimage to Mecca, stopping some time in Tripoli; Cyprus, and Egypt, afterward visiting Je-

rusalem and prominent places in Syria, and reaching Constantinople in the autumn of 1807. He was there for the first time suspected of not being a real Mussulman. He fled, and returning home in 1809 entered the public service under King Joseph Bonaparte, on whose expulsion he was forced to leave the country. He published an account of his travels at Paris in 1814, under the title *Voyages d'Ali Bey en Afrique et en Asie pendant les années 1803 à 1807*, in which he described places and things which no Christian before him had seen. Four years later he set out on a second journey to the East, but died soon after his arrival in Syria.

BADIUS, *Jedema*, or *Jense*, a Flemish printer and author, born at Asseche (whence he was surnamed *Ascensius*) near Brussels in 1462, died in 1535. He was well educated, especially in Latin and Greek, which he taught for 12 years at Lyons, working at the same time as a printer. Early in the 16th century he founded in Paris his famous printing establishment, the *Prelium Ascensianum*, from which issued some of the most famous editions of classic authors. He was himself the author of various translations and annotations, of a life of Thomas à Kempis, of a satire on women entitled *Navicula Stultarum Mulierum*, and other works, in prose and verse. He was the father-in-law of Robert Stephens.—His son CONRAD succeeded him in the printing business, removed to Geneva in 1549, and died about 1565. He wrote *Satires chrétiennes de la cuisine papale* in French verse.

BAENA (anc. *Castra Visiana*), a town of Spain, in the province and 34 m. S. E. of the city of Cordova; pop. about 11,600. Grain and oil are the chief articles of trade, and are exported to Malaga. The site of the old Roman town is still distinguishable.

BAER, *Karl Ernst von*, a Russian naturalist, born in Esthonia, Feb. 12, 1792. He studied at Dorpat and Würzburg, and in 1819 became professor of zoölogy in the university of Königsberg, where he organized the zoölogical museum. In 1834 he was called to St. Petersburg to become the librarian of the academy and one of its most prominent members. In 1837, by order of the czar, he conducted scientific explorations on the northern shores of Russia and made valuable descriptions of the plants and animals. He has written numerous treatises upon zoölogy and botany, especially those of northern Russia.

BAERLE, *Gaspard van* (Lat. *Barlaeus*), a Dutch poet, theologian, and historian, born in Antwerp, Feb. 12, 1564, died in Amsterdam, Jan. 14, 1648. He studied theology at Leyden, and in 1617 was elected professor of logic there. He adopted the principles and wrote in defence of Arminius and the Remonstrants, for which he was at length deprived of his professorship. He then studied medicine and obtained a doctor's degree from Caen, but remained at Leyden, supporting himself by

giving private instruction, till 1631, when he was elected professor of philosophy and rhetoric in the newly founded atheneum at Amsterdam. He was one of the best Latin poets of that period, and has left records of the government of Count Maurice of Nassau in Brazil, and of the reception given to Maria de' Medici at Amsterdam in 1638.

BAEZ, *Buenaventura*, president of the Dominican republic, born at Azua, Santo Domingo, early in this century. He inherited a large fortune from his father, a mulatto, who was prominent in the revolution of 1808; coöperated with Santana in the establishment of Dominican independence; and was president from 1849 till 1853, when he was supplanted by Santana, who expelled him from the country. After the deposition of Santana in May, 1856, Baez, who had spent the interval in New York, resumed the presidency, Oct. 6, 1856; but he was once more ousted by Santana June 11, 1858, and obliged to remain abroad till after the evacuation of Dominica by the Spaniards in 1865, and in December of that year he was elected for a third presidential term. This was interrupted in March, 1866, by an insurrection led by Gen. Pimentel in favor of Cabral, in consequence of which Baez was banished to St. Thomas. A new revolution in December, 1867, drove Cabral from power and restored Baez. After various direct and indirect negotiations, he signed on Nov. 29, 1869, two treaties with President Grant, one for the cession of the bay of Samana and the other for the annexation of the Dominican republic to the United States, subject to the approval of the people of the republic, which was ostensibly obtained in an election (decreed by Baez Feb. 16, 1870) held under the protection of American men-of-war. The United States senate, however, refused to ratify the treaty. A commission was appointed by President Grant, under authority of congress, to visit and examine the island, and reported in April, 1871, in favor of annexation; but the measure was pressed no further. Its failure encouraged Cabral and Pimentel to renew the civil war.

BAEZA (anc. *Beatia*), a city of Spain, in the province and 23 m. N. E. of the city of Jaen, 8 m. N. of the Guadalquivir; pop. 18,400. It has a cathedral and several fine public edifices, of which the most noteworthy are the university, the oratory of St. Philip Neri, the marble fountain with caryatides in the plaza, and the arch of Baeza. In the days when it was held by the Moors, it had a population of 50,000, was surrounded by a strong double wall, and contained the residence of several Moorish kings. The sculptor Gaspar Becerra was born here in 1520. The trade and manufactures are inconsiderable.

BAFFIN, *William*, an English navigator, born in 1584, died in 1622. In 1612 he accompanied James Hall on his fourth arctic expedition, and on his return wrote an account of it, in which

a method is laid down for the first time of determining the longitude at sea by an observation of the celestial bodies. In 1618 he explored the coast of Greenland, and wrote a narrative of his voyage. In 1615 Baffin accompanied Robert Bylot as mate on a voyage to the northwest in the *Discovery*. In the following year he again sailed with Bylot, and on this occasion discovered the bay which has since borne his name. Baffin published an account of both voyages, and gave a very accurate description of the bay. He afterward made voyages to the East, and in 1621 joined an English expedition to the Persian gulf, which united with the Persians to expel the Portuguese, and was killed at Ormuz.

BAFFIN (or **BYLOT**) **BAY**, an extensive gulf or inland sea on the N. E. coast of North America, communicating with the Atlantic by Davis strait, and with the Arctic ocean by Smith sound to the north, and Lancaster sound to the west. It extends about 800 m. from S. E. to N. W., has an average width of 280 m., and is included between the parallels of 68° and 78° N., and the meridians of 50° and 80° W. It was named in honor of William Baffin. It was visited by Capt. Ross in 1818, by Capt. Parry in 1819, by Inglefield in 1852, who established the existence of a channel connecting it with the great polar sea, and by McClure in 1850-'53, who was the first to sail from Behring strait to Baffin bay. The coasts are rocky and precipitous, rising in many places to the height of 1,000 feet, and presenting a vast number of lofty peaks of very singular shape. Innumerable sounds and creeks open on each side of the bay. Black whales of large size, seals, and walrus are captured here, and bears and black foxes and various sea fowl are found on the shores. The depth of water, as far as ascertained, varies from 200 to 1,050 fathoms.

BAFFO, called the Pure, a Venetian woman of remarkable talent and beauty, who was captured in 1580 by corsairs while on the way with her father from Venice to Corfu, and carried to Constantinople, where she became the slave and afterward the sultana of Amurath III., over whom she exercised extraordinary influence. Amurath subjected the female attendants of Baffo to the torture in order to extract from them the secret of her fascination; but as they could confess nothing, the legitimacy of the sultana's influence was no longer questioned. After the death of the sultan she became adviser of her son Mohammed III., and her influence did not wane till 1603, when her grandson Ahmed consigned her to the old seraglio, where she died.

BAGAUDÆ, or *Bagaudi*, a body of Gallic peasants who revolted against the oppression of the Romans about A. D. 270, headed by one Victoria, called by the soldiers Mother of Legions. They besieged and took Augustodunum (Autun), and utterly destroyed what was previously a flourishing metropolis. Claudius temporarily quelled them, and Aurelian remitted their

taxes, and granted them a general amnesty. Under Diocletian, in 294, they rose again, and Diocletian, himself engaged in putting down the Persians and the barbarians of the lower Danube, sent Maximian against them. They rallied under two leaders, *Ælianus* and *Amandus*, who assumed the title of emperor. The coins of these Bagaudian emperors are still extant, and bear pagan inscriptions, although they were reputed to be Christians. Maximian soon compelled the Bagaudæ to capitulate. The two emperors fell in battle. The place of this sanguinary contest was long known as the *Forces des Bagaudes*. The Bagaudæ long continued to be troublesome, and infested the forests and fastnesses of Gaul with an irregular kind of brigandage until the end of the western empire.

BAGDAD, a city of Asiatic Turkey, situated on both sides of the river Tigris, here about 700 feet wide, in lat. 33° 20' N., lon. 44° 25' E.; population estimated at about 100,000, of whom

glazed tiles of various colors, and crowned with domes. There are Syriac, Chaldee, Armenian, and Roman Catholic churches, and several Jewish synagogues. A new Jewish school was established in 1872 by the *alliance israélite universelle*. A large general hospital has recently been erected. The bazaar built by Daoud Pasha is one of the finest in the East, and well stocked with home and foreign manufactures. The view of the city from the river presents a pleasant spectacle, the luxuriant date groves and orange gardens forming an agreeable contrast with the domes and minarets. In summer the heat is intense, and sometimes the thermometer for several days ranges between 110° and 120° F. Five miles below Bagdad the Saklavieh or Isa canal brings during the season of the floods a portion of the waters of the Euphrates into the Tigris. The commercial importance of this city has greatly declined, though during the last 25 years its decay has been somewhat

checked. Large rafts supported by 200 or 300 inflated skins are much used for the transportation of goods. Fleets of boats of from 40 to 70 tons burden ascend and descend the river with cargoes to and from the Persian gulf, and caravans carry goods in different directions from this great emporium. The products of the region round Bagdad are tobacco, timbac (a plant used as a substitute for tobacco), maize, wheat, barley, cotton, rice, fine wool, goats' hair, gall nuts, and yellow berries. The fruits are grapes, melons, apricots, quinces, figs, cherries, pomegranates, oranges, lemons, citrons, pears, and dates. Wild asses abound on the plains.

Besides the above-mentioned articles, the city exports also horses, pearls, coral, honey, raw silk, bitumen, naphtha, saltpetre, and salt. The imports from Asiatic Turkey and Europe are soap, silk, woollen cloths, prints, opium, and copper; from Arabia, raisins, gum, coffee, and drugs. The revenue derived from the tax on transit goods is estimated at \$3,500,000. An English company has projected a railway from Bagdad to the Mediterranean, by way of Aleppo. Bagdad is the seat of a Turkish vali or governor general, whose vilayet contains an area of about 10,000 sq. m., comprehending parts of Kurdistan and Khuzistan, most of Al-Jezireh, and Irak-Arabi. —The city was built by the caliph Al-Mansour as his capital, 762-'6, and called *Medinat el-Salem*, "City of Peace." It was a favorite residence of the Abbasside caliphs, was beautified by Haroun al-Rashid, and under his son Al-Mamoun became the great seat of Arabian literature and learning. In 878 the city was

Ezekiel's Tomb.

about 15,000 were Jews, 8,000 native Christians, and the remainder Mohammedan Arabs, Kurds, Turks, and Persians. Bagdad is unequally divided by the river Tigris, two thirds being on the left bank, and the remainder on the right, and the two divisions are connected by two bridges of boats. The town is fortified on one side by a high brick parapet wall, flanked at intervals with high-bastioned towers and surrounded by a wide fosse. The citadel is situated on the N. W. extremity. A large suburb, enclosed by ramparts to resist the attacks of the Arabs, is on the other side. The houses in Bagdad, like those of other oriental towns, present on the exterior either dead walls or ruins, and the streets are narrow, winding, and unpaved. The interiors of the houses of the wealthier classes are comfortable in an eastern sense, and compare favorably with those of Damascus and other cities. There are several mosques ornamented with

said to have 2,000,000 inhabitants. It was conquered in 1258 by Hulaku, the grandson of Genghis Khan, and by Tamerlane in 1401, by the Persians and Turks successively in the 15th century, by the Persians again in 1623, and by the Turks finally in 1638. It suffered severely from plague in 1831, and from famine in 1870-'71.

BAGE, Robert, an English novelist, born at Derby in 1728, died at Tamworth in 1801. He was a paper-maker, in which trade he continued for the greater part of his life. His principal works are "Mount Heneth," "Barham Downs," "The Fair Syrian," and "James Wallace." Sir Walter Scott recommended that he should be included in Ballantyne's "Novelist's Library," and wrote his life for that work.

BAGGESEN, Jens Immanuel, a Danish poet, born at Korsør in Seeland, Feb. 15, 1764, died in Hamburg, Oct. 3, 1826. He was educated at Copenhagen, and gained considerable reputation while still young by his comic tales and a collection of odes and songs. The most remarkable of his writings is his *Labyrinth*, a species of autobiography. He wrote many lyrical poems in German—a language which he used with the same facility as his native tongue. A collection of these appeared at Hamburg in 1803, and at Amsterdam in 1808. His best German work is his poem *Parthenais*, of which a French translation appeared in 1810. He was appointed professor of the Danish language at Kiel in 1811. A few years later he returned to Denmark, but finally left his native country in 1820. A new edition of his Danish writings appeared in 1845, in 12 volumes, at Copenhagen. A collection of his German writings was also made in 1836.

BAGHERIA, or *Bagaria*, a town of Sicily, in the province and 9 m. E. S. E. of Palermo, on the railroad from Palermo to Termini; pop. 13,200. Near it are numerous villas of the nobility.

BAGHIRMI, a kingdom of central Africa, S. E. of Lake Tchad, between the Bornoo and Wadai countries, bounded W. by the Shari river and its affluents; greatest length from N. to S., about 240 m.; greatest breadth, 150 m.; pop., inclusive of the pagan dependencies in the outlying S. E. provinces, about 1,500,000, chiefly negroes, and nominally Mohammedans, though there are still many remains of pagan rites. The country is principally a plain, nearly 1,000 feet above the sea, there being no mountains excepting in the extreme north and in the outlying S. and S. E. provinces. The capital is Masenya, in lat. 11° 38' N., lon. 16° E. The army consists of 10,000 infantry and 3,000 cavalry. The chief products are millet, sorghum, sesamum, beans, ground nuts, a kind of grass called *fojo*, rice, cotton, and indigo. Wheat is raised only for the private use of the sultan. The principal trees are the tamarind and the deleb palm. The climate is extremely hot. There are no mines. The horses are fine, and the Shouwa Arabs wandering between Baghirmi and Lake Tchad have large flocks of sheep

and cattle. The people (Bagarmi) are superior in appearance and character to other central African tribes, and the women are among the finest in Negroland; but the men are cruel in warfare and castrate their prisoners.—Baghirmi became an independent kingdom in the 16th century, and was afterward converted to Mohammedanism. In 1815, after a long war, it became tributary to Bornoo and Wadai. The title of the ruler is *banga* (sultan). Dr. Barth (1852) was the first European to visit the country.

BAGNÈRES, the name of two bathing towns of S. W. France, in the Pyrenees, both known to the Romans, though under what names is uncertain. I. *Bagnères-de-Bigorre*, in the department of Hautes-Pyrénées, capital of an arrondissement, on the left bank of the Adour, at the entrance of the valley of Campan, 13 m. S. of Tarbes; pop. in 1866, 9,433. Its warm and hot mineral springs, more than 40 in number, attract numerous invalids and pleasure-seekers. It has manufactories of barèges. II. *Bagnères-de-Luchon*, in the department of Haute-Garonne, 18 m. S. E. of the preceding; pop. in 1866, 3,921. It lies at the foot of the Pyrenees, in the beautiful valley of Luchon, about 5 m. from the Spanish frontier. It has hot and cold mineral springs, and is surrounded by fine scenery. In the neighborhood are copper mines and slate quarries.

BAGNOLES, a hamlet of France, in the department of Orne, in a valley 13 m. S. S. E. of Domfront. This village, celebrated for its baths and mineral springs, was built in the 17th century, but has been in later times much improved and adorned with fine buildings and promenades.

BAGOAS, a eunuch in the service of Artaxerxes Ochus of Persia, who, though a native of Egypt, aided the king in the reconquest of that country. He was, however, so much displeased by the sacrifice of the king to the sacred animals and other objects of worship in Egypt that, after his return to Persia, he poisoned him, and raised Arses, his youngest son, to the throne, having murdered all the others. Soon becoming offended with the new king also, he destroyed him and made Darius Codomannus king (336 B. C.). He afterward attempted to poison Darius, but was detected and poisoned himself. He is supposed to be identical with the Bagoses mentioned by Josephus, who led the troops of Artaxerxes Ochus to Judea, seized the temple, and compelled every Jew to pay a tribute of 50 shekels for each lamb sacrificed.

BAGOT, Sir Charles, a British diplomatist, born at Blithfield, Sept. 23, 1781, died at Kingston in Canada, May 18, 1843. He was the second son of William, first Lord Bagot. In 1807 he was appointed under-secretary of state for foreign affairs; in 1814 was sent on a special mission to France; in 1820 was ambassador at St. Petersburg, and in 1824 in Holland. On the death of Lord Sydenham in 1841 he

was made governor general of the Canadas, which office he held till his death.

BAGPIPE, a wind instrument of great antiquity, which seems to have been a favorite with many nations of Europe in the dawn of musical taste, but is so identified at the present day with the Scotch Highlanders as to be considered almost peculiar to them. Its invention is traced back to the mythical age of Greece, while among the Romans the instrument, almost identical in form with that now in use, was familiarly known as the *tibia utricularis*. It was also known to many of the Scandinavian tribes, and was probably introduced into Ireland and Scotland by the Danes and Norwegians at a very early period. The instrument consists of a leather bag, inflated through a valved tube by the mouth or a bellows, connected with which is a flute part called the chanter, perforated with holes, and furnished with a reed, the action of the air from the bellows upon which produces the music. Three pipes or drones, two of which are in unison with D on the chanter, while the third, or great drone, is an octave lower, complete the instrument. The rude construction and limited compass of the bagpipe render it available for the performance only of tunes consisting of a few notes, and all set on the same key. As it is ignored by educated musicians, we find but little music written for it, and the pipers play almost entirely by ear. It is said that schools exist in some of the Scottish islands for instruction on the bagpipe, and the Highland society of Edinburgh offer annual premiums for the sake of encouraging the art.

BAGRADAS. See MEJERDA.

BAGRATIDES, or *Bagratides*, a royal family of Armenia and Georgia, whose founder was Bagrat or Bagrad, according to tradition the descendant of a Jewish exile of the time of Nebuchadnezzar, who were allowed by Valarsaces, first king of Armenia of Parthian race, about 149 B. C., the privilege of putting the crown upon the head of the Armenian monarchs. About A. D. 300 the family adopted Christianity, and in the 5th and 6th centuries resisted the efforts of the Neo-Persians to bring the Armenians back to the religion of Zoroaster. The Byzantine emperors and afterward the caliphs of Bagdad conferred the dignity of governor of Armenia upon several of the Bagratides. The Bagratide Ashod or Ashot, in the latter half of the 9th century, first assumed the title of shah-in-shah or prince of princes, and subsequently the kingly crown, on the condition of rendering a small tribute. This dynasty reigned in Armenia till 1079, frequently sharing the supremacy with princes of other houses. Another Ashod had ascended the throne of Georgia about 790, and his son Bagrad firmly established the family on it in 841. This dynasty maintained its independence till the occupation of Georgia by the Russians at the beginning of this century.

BAGRATION, Peter, prince, a Russian general of the Georgian Bagratide family, born about

1765, died Oct. 7, 1812. He entered the Russian army as a common soldier, and first served in the wars against the mountaineers of the Caucasus; then under Suvaroff against the Turks in 1788, when he took part in the storming of Otchakov, and against the Poles in 1794. Under the same general he fought with distinction against the French in Italy and Switzerland (1799). In 1805, under Kutuzoff, he commanded the vanguard in the Austro-Russian campaign; at Znaim he successfully resisted Murat and Lannes, whose forces outnumbered his. Having been created a lieutenant general, he commanded the vanguard of the Austrian army at Austerlitz, under Prince Lichtenstein. In the Prussian campaign of 1807, his resistance made the battle of Eylau so terrible that even Napoleon shuddered at its bloody results. With equal stubbornness he fought at Friedland. In 1808 he overran Finland, and occupied the Aland isles; and in 1809 he commanded against the Turks, and besieged Silistria, though without final success. In 1812 he fought an unsuccessful battle with Davoust at Mohilev, but succeeded nevertheless in joining the Russian main army. He was mortally wounded at the terrible battle of Mohaisk or Borodino, Sept. 7, 1812, just a month before he died. He married in 1810 a lady of great beauty and wealth descended from Catharine I. At the congress of Vienna she was one of the leaders of fashion and gallantry, and subsequently lived in Paris in grand style. In 1830 she married secretly Col. Caradoc, afterward known as Lord Howden, from whom she soon separated herself. She died in 1856.

BAGUL, or *Baghul*, a small state in N. W. India, on the S. bank of the Sutlej, in lat. 31° N., lon. 77° E.; area about 100 sq. m.; pop. about 40,000. The surface is generally mountainous, with two summits, Bahadurghar and Bara Devi, 6,233 and 7,003 ft. above the sea. The revenue of the state is only £5,000, but it maintains an army of 3,000 men.

BAHAMAS, a chain of islands belonging to Great Britain, extending N. W. and S. E. between the N. coast of Santo Domingo and the E. coast of Florida, and lying between lat. 21° and 27° 30' N., and lon. 70° 30' and 79° 5' W. They are about 600 in number, of which only about 15 are inhabited, a great many of them being merely small rocky islets. The most important of them are Grand Bahama, Great and Little Abaco, Andros, New Providence, Eleuthera, San Salvador, Rum Cay, Great Exuma, Watling Island, Long Island, Crooked Island, Atwood's Key, and Great and Little Inagua. The group is about 600 m. long, and has an estimated area of upward of 8,000 sq. m.; pop. in 1871, 39,162. Most of the islands of the group are situated on the Bahama banks. They are generally very flat, long and narrow, formed of calcareous rock, with a light, sandy soil; though without running streams, there are numerous springs. Fruit is produced in abundance. Maize, yams, sweet potatoes, oranges,

limes, lemons, &c., are among the products of the islands; there are also several valuable woods, as mahogany, fustic, lignum vitae, &c. In the more southerly islands are large salt ponds. The principal exports are salt, sponge, pineapples, and oranges. The climate is salubrious, and very beneficial to consumptives. The imports in 1869 amounted to £240,584, and the exports to £168,002. The government is administered by a governor, aided by an executive council of 9 members. There is a legislative council of 9 members and a representative council of 28 members. The capital is Nassau, on the island of New Providence, which during the civil war in the United States was a famous place of resort for blockade-runners. The commercial activity by which it was then characterized has since fallen away.—San Salvador, called Guanahani by the natives, was the first land discovered by Columbus in 1492. The

Bahamas were then inhabited by an inoffensive race, whom the Spaniards carried away and forced to labor in the mines of Santo Domingo and the pearl fisheries of Cumana. They then remained unoccupied till 1629, when the English settled them. These were dispossessed by the Spaniards in 1641, and the islands repeatedly changed masters until they were annexed permanently to the British empire by the treaty of 1783. At the close of the American revolutionary war many of the royalists settled in the Bahamas.

BAHAWALPOOR. See BHAWLPOR.

BAHIA (Port. and Span., bay). I. A province of Brazil, bounded E. by the Atlantic, N. W. and N. by Pernambuco and Sergipe, W. by Goyaz, and S. by Minas Geraes and Espirito Santo; area, about 200,000 sq. m.; pop. in 1867, estimated at 1,400,000, including nearly 800,000 slaves. It is traversed

Bahia.

from S. W. to N. E. by a mountain range having various local names and sending forth lateral offshoots. The magnificent primeval forests are disappearing before the increasing cultivation of the soil, though many of them, especially in the Serra-Mar region, noted for their wealth of timber, still remain. The mountainous regions are the least fertile, owing to excessive dryness. The principal river is the São Francisco, which forms the N. and N. W. boundary, and has a rather fertile valley; but the most productive region of Bahia and the most densely populated of Brazil is the country along the coast, called the Reconcavo, with many villages, farm houses, plantations, and over 20 small towns. The province is rich in palm trees of prodigious size; in cashew, nayha, and gum-yielding trees; in medicinal plants, and in manioc, fruits, and vege-

tables. Minerals abound, but are not worked. The discovery of diamond fields by a slave in 1844, in the Serra Sincura, led to a great influx of population. Bahia exports more sugar than all the rest of Brazil. It is famous for its tobacco and for the increasing production of cotton, rivalling that of Pernambuco. The rice is of superior quality; the Brazil wood equals that of Pernambuco, but the coffee is inferior to that of Rio. It was one of the first of the Brazilian provinces peopled by Europeans, and the aborigines, who chiefly inhabit the mountains, are more rapidly declining here than in any other part of the empire. II. Bahia, or San Salvador, capital of the preceding province and of a district of the same name, situated on All Saints' bay (Bahia de Todos os Santos), about 800 m. N. E. of Rio de Janeiro, in lat. 13° S., lon. 38° 30' W.; pop. over

150,000, composed about equally of whites, blacks, and mixed races. Among the whites are many foreign merchants, especially from Hamburg and Bremen. The bay from which the city and province derive their name is one of the finest in the world, being 37 m. long from N. to S., and 27 m. wide from E. to W., with two entrances from the south, on either side of the island of Itaparica, and a depth of water varying from 8 to 40 fathoms. The bay contains several small islands, and is defended by a few forts. The city is situated on the E. shore, near the entrance and just inside Cape São Antonio. It is built partly on the shore, but chiefly on high ground. The lower town is dirty and has very narrow streets. The houses are chiefly of stone, and some of them five stories high. In the Praya, the great business street, which runs 4 m. along the wharves, are the church of the Conception, built of stone imported from Europe, the exchange, the warehouses, the arsenal, and ship yards. The number of churches and religious houses exceeds 60. The archbishop of Bahia is primate of Brazil. In the upper town, which is well paved and has pleasant streets and a number of handsome residences, constructed with balconies and blinds in place of windows, is the most renowned Brazilian cathedral (formerly the Jesuit church), built of European marble and containing pictures of Loyola and St. Francis Xavier. The ancient Jesuit college has become a military and medical school. There is a large ecclesiastical seminary, an extensive library, and a theatre. Among other public buildings of the upper town are several hospitals (partly supported by lotteries), and the palaces of the governor and the archbishop. In the wooded promenade, laid out on an abrupt promontory, is an obelisk in honor of John VI. The exports include sugar, cotton, coffee, tobacco, nuts, cacao, hides, horns, rum, piassara, tapioca, dyewoods, and rosewood. The value of diamonds exported is estimated at \$3,000,000 annually. The imports are cotton goods, woollen and linen cloths, fish, flour, provisions, hardware, wine, copper and iron, soap, coals, and other articles. Estimated value of exports, \$8,000,000; value of imports, nearly \$10,000,000. The importations from England, which formerly constituted the greatest part of the import trade, have lately declined, and the trade with the German ports is also less active than formerly. About 400 British vessels enter and leave the port annually, and the shipping of all nations includes nearly 800 vessels. The commerce with the United States in the nine months ending June 30, 1870, included 61 inward and outward vessels, with cargoes of an aggregate value of about \$400,000. The coasting trade is exclusively carried on by Brazilian vessels.—The bay was discovered in 1503 by Amerigo Vesputius, and the city was founded in 1510 by the Portuguese navigator Correa, who called it San Salvador. In 1549 the present name was adopted on its

becoming the capital of the Portuguese possessions, which distinction was transferred to Rio de Janeiro in 1763. The city suffered greatly during the commotions which led to the separation of Brazil from Portugal. The Portuguese evacuated it on July 1, 1823, since which it has acquired vast commercial importance as the foremost Brazilian city next to Rio. Since 1858 there has been railway communication between Bahia and Joazeiro. Captain Collins of the United States steamer Wachusett captured here on Oct. 7, 1864, the confederate cruiser Florida.

BAHR, Johann Christian Felix, a German philologist, born in Darmstadt, June 13, 1798. He was educated at Heidelberg, and became professor there in 1826, and subsequently chief director of the university library, and of the lyceum and the philological seminary. His principal works are: *Geschichte der römischen Literatur* (3 vols., Carlsruhe, 1828; 4th ed., 1868), and *Herodot* (1832-'5; new ed., 4 vols., Leipsic, 1855-'61).

BAHRDT, Karl Friedrich, a German theologian, born at Bischofswerda, Aug. 25, 1741, died in Halle, April 23, 1792. He was a professor of theology, but his violent attacks upon the clergy and orthodoxy, and his adventurous and not very reputable life, involved him in perpetual difficulties; and for a year he was a prisoner of state in the Prussian fortress of Magdeburg, where he wrote his autobiography (4 vols., Berlin, 1790). His writings enjoyed a transient popularity, especially *Briefe über die Bibel im Volkston*. He denied the authenticity of miracles, and was a severe critic of the Scriptures. Kotzebue published *Dr. Bahrdt mit der eisernen Stirn*.

BAHREIN (or AVAL) ISLANDS, a group consisting of one large island and several smaller ones in the Persian gulf, in a bay on the E. coast of Arabia, between lat. 25° 30' and 26° 30' N., and lon. 50° and 50° 30' E.; pop. about 60,000. The most important of them is Bahrain, about 27 m. long and 10 broad. The interior is hilly; the soil is fertile, and produces wheat, barley, dates, figs, and other tropical fruits. Springs are plentiful in the interior, but on the coast fresh water is procured in skins from springs beneath the surface of the sea, by divers. Manamah, the largest town, has a good harbor and is the centre of commerce. The island next in size is Moharrek, so named from the capital, situated on its southern side. It contains two or three forts close to the seashore, and the sheikh's palace. The Bahrain islands are noted for their extensive pearl fisheries, which were known to the ancients, and employ a large number of boats, each manned with from 8 to 20 men. The annual value of the pearls is estimated at from \$1,000,000 to \$1,500,000. Tortoise shell, shark fins, and dates are also exported. The inhabitants are Arabs, governed by a sheikh tributary to the sultan of Oman.

BAIÆ (now *Baja*), an ancient seaport town and watering place of Italy, about 10 m. W. of Naples, on the bay of Baiæ, between the Lucrine lake and Cape Misenum, and opposite the town of Puteoli. The narrow strip of coast sheltered by a semicircular ridge of hills on which Baiæ stood was covered with the palaces and baths of the Roman nobles. For want of room they often built out into the sea, and remains of submarine foundations are still visible. The leading attractions of Baiæ seem to have been its mild climate, its numerous hot springs, and its delightful scenery. Julius Cæsar, Augustus, Tiberius, Caligula, Nero, and Caracalla all frequented this spot; and it was the favorite resort of Horace and most men of wit and fashion in his day. Moralists spoke of it as a hot-bed of vice and luxury. It retained its prosperity until the invasion of Theodoric the Goth. With the fall of the empire it ceased to be visited; its villas were left to decay, and the whole coast is now a desert. The springs, no longer confined, have formed stagnant pools, giving off unwholesome exhalations in summer. The ground is strewn with ruined fragments of bricks, marbles, and mosaics. The only buildings remaining are three or four edifices of a circular form, two of which were in all probability warm baths. Another is believed to have been a temple of Venus. The whole coast has evidently undergone great changes since the time of the Romans, and appears to have sunk several feet below its ancient level.

BAIKAL (Russ. *Soyatse More*, holy sea), a lake in the S. W. part of eastern Siberia, on the boundary of the government of Irkutsk and of the new province of Transbaikalia, between lat. 51° and 56° N. and lon. 103° and 110° E. Its length from S. S. W. to N. N. E. is about 875 m., and its breadth from 20 to 70 m., making it, next to the Caspian and Aral, the largest inland body of water in Asia. The greatest depth, according to soundings taken in 1872, is over 600 fathoms at the extreme S. W. part of the lake. It is surrounded by desolate shores and by rugged though picturesque mountains, densely covered with forests, from whence issue innumerable streams. The Upper Angara river flows into the lake at its N. end, and the Lower Angara issues from it near the S. end, being its only outlet. The Selenga, flowing into it on the S. E., is its largest tributary. The greatest island of the lake, Olkhon, is separated by a narrow strait from the W. coast. The principal fisheries are in the Angara river, to which many kinds of salmon are carried through the Yenisei from the Arctic, especially the omul (*salmo autumnalis* or *migratorius*). Baikal is one of the very few lakes which contain fresh-water seals. Sturgeons abound in the Selenga river. They are captured in large numbers, and their skins exported to China. The golomyinka (*calyonimus Baicalensis*), a fish 4 to 6 inches long and singularly fat, is never taken alive, but cast dead upon

the beach in great quantities, especially after storms. Its oil is sold to the Chinese. The annual value of the fisheries is estimated at 200,000 rubles. The number of sailing vessels is about 50, and there are several steamers; and the activity in the mines of Transbaikalia, and the trade with the Amoor Country and China, are fast increasing. From November to May the lake is traversed on the ice. The shores of the lake and of the Angara and Selenga rivers are chiefly settled by Russians. There are various tribes which have been incorporated since 1856 under the name of the Baikal Cosacks. The Tunka Alps border the S. shore of the lake, and one of their summits, the snow-clad Kharma Davan, is 6,000 ft. high. The Baikalian mountains proper stretch N. E. from the Lower Angara, and are remarkable for their fantastic peaks, numerous rivulets, volcanic formations, thermal springs, and wealth in gold and silver and various gems. Earthquakes are frequent, and were especially violent in 1861-'2.

BAIL (law Fr., *bailler*, to deliver), in law, the delivery of a person out of the hands of the sheriff or other officer after arrest into the custody of one or more sureties, who undertake to be responsible for such person. The same term was also used to designate the sureties themselves, and this came to be its most common signification. Bail in civil cases is either for appearance, called bail below, or to the action, called bail above. The sureties in the first give an undertaking to the arresting officer that the defendant shall appear in the cause in accordance with the practice of the court, and, if the case is one requiring special bail, that he shall cause such bail to be duly entered and perfected. For the sufficiency of this bail the officer is responsible, and when it is accepted by him the defendant is discharged from his custody. Sureties in bail to the action undertake for the appearance of the party when final judgment shall have been rendered and process shall have been issued thereon to take the body of the defendant in satisfaction. The sureties may be excepted to by the plaintiff, in which case they must justify their responsibility on oath; but if not excepted to in due time, or if they justify after exception, the defendant's appearance is entered and the bail below is discharged. The bail piece is a certificate issued to the sureties attesting the taking of bail. Formerly the plaintiff was entitled to bail as of course in most cases, but now by the provisions of various statutes it is not generally demandable in civil suits, either in England or in the United States, except upon a showing that some tort has been committed to the damage of the plaintiff, or that his demand springs from the official or professional misconduct or default of the defendant, or, if the suit is upon contract, that there was fraud in contracting the debt, or in endeavoring to put property beyond the reach of process for its collection. The showing is by affidavit, and thereupon an order is made by a judge or commissioner that

the defendant be held to bail in a specified sum. Although on giving bail the defendant is set at liberty, he is supposed to be constantly in the custody of his sureties, who may, at any time before their liability has been fixed by forfeiture of the condition of their obligation, arrest and surrender him into custody in exoneration of themselves. "Common bail" is fictitious bail supposed to be entered by the defendant in cases where special bail is not required, or which the plaintiff enters for the defendant if he makes default.—In criminal cases it is provided by the statute 1 William and Mary, and also by the constitutions of the United States and of the several states, that excessive bail shall not be required; but what is excessive bail must be left to the judgment of the officer or court empowered to decide upon it. Formerly the accused party was not allowed to give bail in cases of felony, but now he is permitted to do so except in cases of the highest crimes, and even then unless the proof of guilt is apparent or the presumption great. The undertaking of the sureties is for the appearance of the defendant to abide the order of the court, and is in the form of a recognizance.—The term bail is also sometimes applied in law to those who become sureties for a party for the payment of money or the performance of some other act, in cases where no arrest has been or could be made.

BAILEY, Camillel, an American journalist, born at Mount Holly, N. J., Dec. 3, 1807, died at sea, June 5, 1859. He studied medicine in Philadelphia, taking his degree in 1828. After making a brief visit to China in the capacity of physician to a ship, he began his career as an editor in Baltimore, in conducting the "Methodist Protestant." In 1831 he removed to Cincinnati, and in 1836 joined James G. Birney in conducting the first anti-slavery newspaper in the West, the "Cincinnati Philanthropist." During the first year their printing establishment was twice assailed by a mob, the press thrown into the Ohio river, and the books and papers burned. In 1841 his press was again destroyed by a mob, but he continued the publication of his paper in Cincinnati till after the presidential election of 1844. He was afterward selected to be the editor of a new anti-slavery paper at Washington, under the auspices of the American and foreign anti-slavery society, and the "Philanthropist" became merged in the "National Era," the first number of which appeared Jan. 1, 1847. In 1848 he had his last conflict with popular violence, when a mob for three days besieged his office. The "Era" was an influential organ of the anti-slavery party, and had some literary pretensions. It was the medium for the first publication of Mrs. Stowe's "Uncle Tom's Cabin." At the time of his death Dr. Bailey was on a voyage to Europe for the benefit of his health.

BAILEY, Jacob Whitman, an American naturalist, born at Ware, Mass., April 29, 1811, died at West Point, N. Y., Feb. 27, 1857. He

graduated at the West Point military academy in 1832, and was appointed lieutenant in the artillery. After passing six years at several military stations in Virginia and Carolina, he was appointed professor of chemistry, botany, and mineralogy at the military academy in 1839. He was especially distinguished as a microscopist. He published a volume of "Microscopic Sketches" containing about 3,000 original figures, and gave much attention to the minute animal and vegetable organisms at that time all included under the general term infusoria, and to the whole family of algæ. Among the principal subjects of his research were the fossil deposits of Richmond and Petersburg in Virginia, the rice fields of the South, and the dredgings of the coast survey and of the line of soundings across the Atlantic, made by Lieut. Berryman in reference to the laying of the telegraphic cable. He made a microscopical collection of more than 3,000 objects, fixed upon slides, catalogued, and marked. His collection of algæ was equally complete, consisting of about 4,500 specimens, systematically arranged in portfolios. These collections, together with all his books on botany and microscopy, his sketches, scientific correspondence, and a large store of rough material from the localities he had studied, he bequeathed to the Boston society of natural history. He also made improvements in the microscope.

BAILEY, or Baily, Nathan, an English lexicographer, a schoolmaster at Stepney, near London, died in 1742. His most important publication was an "Etymological English Dictionary" (2 vols. 8vo, London, 1726; 2d ed., 1737; best ed., by J. Nicol Scott, folio, 1764), which furnished the basis of Dr. Johnson's famous work. He was the author also of a *Dictionary Domesticum*, and of several school books.

BAILEY, Philip James, an English poet, born in the parish of Basford, Nottinghamshire, April 22, 1816. He assisted his father, Thomas Bailey, in editing the "Nottingham Mercury," and also studied law, being called to the bar in London in 1840; but his poem of "Festus," finished in 1836 and published in 1839, having attracted great attention, he devoted himself to literature. He has since published "The Angel World" (1850); "The Mystic" (1855); "The Age: Politics, Poetry, and Criticism" (1858); and "International Policy of the Great Powers" (1861).

BAILEY, Samuel, an English philosopher, born in Sheffield in 1791. He was a banker for many years, and has spent his whole life in Sheffield. He attracted great attention by his "Essays on the Pursuit of Truth and on the Progress of Knowledge" (1821), and "Essays on the Formation and Publication of Opinions" (1829). Among his later works are: "The Theory of Reasoning" (1851); "Discourses on Various Subjects, Literary and Philosophical" (1852); "Letters on the Philosophy of the Human Mind" (1855-'63); and "On the Received Text of Shakespeare's Dramatic Writ-

ings and its Improvement" (2 vols., 1862-'6). He is a utilitarian and a follower of Locke.

BAILEY, Theodora, an American naval officer, born in New York in 1803. He entered the navy as midshipman in 1818, and was made lieutenant in 1827, commander in 1849, and captain in 1855. In the latter part of 1861 he was ordered to the steam frigate *Colorado*, with which he participated in the bombardment of the confederate works near Pensacola. In the capture of the Mississippi forts by the squadron of Flag Officer Farragut (April, 1862), he commanded the second division of the attacking force. On the reorganization of the navy in 1862 he was made commodore, and as acting rear admiral succeeded to the command of the eastern gulf blockading squadron, where he was very successful in breaking up blockade-running on the Florida coast. He was promoted to rear admiral July 25, 1866, and in the following October placed on the retired list.

BAILIFF (Fr. *bailli*, Lat. *balivus*), a person to whom some authority or charge is committed. The term as used by the Normans designated the chief magistrates of counties or shires, and bailiwick is still retained in writs and other judicial proceedings as defining the extent of jurisdiction within which the process may be executed, usually the same as county. It came into general use as a designation of any judicial or ministerial office performed by a deputy of a local magistrate; but as the judicial functions of sheriffs and lords having private jurisdiction declined, bailiffs were known as the ministerial deputies of sheriffs. A bound bailiff (vulgarized into bum-bailiff) is a sheriff's officer who has given sureties to the sheriff for his official conduct. The term bailiff was also applied in England to magistrates of certain towns, keepers of castles, &c., and is still used to some extent in one or other of these senses, but more commonly expresses a steward or agent of a lord or other large land proprietor. In the United States it is sometimes, but rarely, used for a sheriff's deputy or constable, and is occasionally met with as a legal designation of an agent liable to account for the rents or profits of property intrusted to him. In Scotch law a synonymous term, *baillie*, is applied to a ministerial officer to whom writs are directed. It is also used to designate a city magistrate similar to an alderman in England.

BAILLET, Adrien, a French scholar and writer, born at Neuville, in Picardy, June 13, 1649, died Jan. 21, 1706. He was educated for the church, but devoted his life to study and authorship. His most important publication was entitled "Judgments of the Learned upon the Principal Works of Authors," a book of criticism which taught better rules than it illustrated. He also produced a book on "Devotion to the Holy Virgin," the lives of the saints, which extended to 4 volumes, a life of Descartes, a history of Holland from 1609 to 1690, and numerous other works. For 26 years he was librarian to M. de Lamoignon, advocate

general of the parliament of Paris, and made a catalogue of his library in 35 vols. folio.

BAILLEUL, a town of France, department of Nord, near the Belgian frontier; pop. in 1866, 5,970. Its manufactures embrace lace, thread, linen, perfumes, beet sugar, snuff, crockery, and pottery. Bailleul cheese is noted for its excellence.

BAILLIAGE (territory of a bailiff), a French term equivalent to bailiwick in English. In Switzerland the term was applied to districts into which the aristocratical cantons were divided, and over which bailiffs were appointed by the governed, and also to those territories which were subject to two or more of the cantons and governed by bailiffs appointed by and responsible to such cantons. These Swiss bailliages anciently formed part of the Milanese. Their names were Mendrisio, Balerna, Locarno, Lugano, Val Maggia, Bellinzona, Riviera, and Val Brenna. Most of these were ceded to the Swiss cantons in 1512 by Maximilian Sforza, in gratitude for Swiss aid in recovering the duchy of Milan from the troops of the French king, Louis XII. In 1802 the canton of Tessin was formed by Bonaparte out of the Italian bailiwicks, which arrangement was confirmed by the European sovereigns after his abdication in 1814, and also by the Helvetic diet.

BAILLIE, Joanna, a Scottish poet, born at Bothwell, Lanarkshire, in 1762, died at Hampstead, near London, Feb. 23, 1851. Her father, a Presbyterian clergyman, who afterward became professor of divinity in Glasgow university, gave her a sound education. When her brother, Dr. Matthew Baillie, commenced practice in London, she and her sister Agnes removed to that city and took up their residence at Hampstead, where they lived for over 60 years. In 1798, at the age of 36, Miss Baillie published the 1st volume of her "Plays on the Passions," and successive volumes appeared in 1802, 1812, and 1836. Each of these plays was intended to illustrate the effect of a single ruling passion on life and character. A volume of miscellaneous plays appeared in 1804; it contained a Highland tragedy called "The Family Legend," which Scott (who made her acquaintance in 1806) caused to be represented at the Edinburgh theatre early in 1810, with a prologue by himself and an epilogue by Henry Mackenzie. "De Montfort" ran for 11 nights at Covent Garden theatre, Mrs. Siddons and John Kemble playing the leading parts. At a later period Kean produced this play, but it failed. Her plays "Henriquet" and "The Separation" were also brought out in London. She also wrote two plays published separately, called "The Martyr" and "The Bride." Her dramas were written rather for the closet than the stage, and, though greatly admired by the most competent critics, had but moderate success when acted. Besides ballads, fugitive pieces, occasional poems, and songs (many of them in the Scottish dialect, and humorous), Miss Baillie published metrical legends of exalt-

ed characters, and a prose dissertation called "A View of the General Tenor of the New Testament regarding the Nature and Dignity of Jesus Christ." Miss Baillie was greatly esteemed by two generations of scholars. Her poetical works were collected and published in 1851.

BAILLIE, Matthew, a Scottish physician, born at the manse of Shotts, Lanarkshire, Oct. 27, 1761, died at Cirencester, Gloucestershire, Sept. 23, 1823. He was the elder brother of Joanna Baillie, and nephew of William and John Hunter, the anatomists. Having spent several years at the Glasgow university and one year at Balliol college, Oxford, he went to London in 1780 to study under the direction of Dr. William Hunter, to whom two years after he became assistant and demonstrator. In 1783, on the death of Dr. Hunter, who bequeathed him his anatomical theatre and the use of his museum for 30 years, Mr. Baillie commenced giving lectures in conjunction with Mr. Cruikshank, the anatomist. He was for 13 years physician to St. George's hospital, and in 1795 published a very valuable treatise on morbid anatomy, which was translated into German, French, and Italian. He afterward published a 4to volume of illustrations to this work. By the time he was 40 his fees in one year (during which he said he had scarcely time to take a regular meal) amounted to £10,000. He bequeathed his medical library and his valuable collection of anatomical preparations to the college of physicians, with £600 to keep them in a perfect state of preservation. His lectures were published after his death.

BAILLIE, Robert, a Scottish theologian, born at Glasgow in 1599, died in July, 1662. He was educated at the Glasgow university and ordained by Archbishop Law in 1622. In the religious controversies of the day he generally preserved a moderate tone. He was a member of the general assembly of 1638, which protested against the episcopacy, and in 1640 was chosen as commissioner to London to prefer charges against Archbishop Laud. On his return to Glasgow in 1642 he became a professor of divinity in the university, and in the following year he was sent as a delegate to the Westminster assembly of divines, where he maintained the rights of the presbytery with great spirit. After the execution of Charles I. in 1649 he was sent to Holland to invite Charles II. to accept the crown and covenant of Scotland. After the restoration in 1660 he was made principal of the Glasgow university. Dr. Baillie wrote *Opus Historicum et Chronologicum* (Amsterdam, 1663) and many other works, mostly theological pamphlets and discussions. His "Letters and Journals," of great historical value, were first published in 1775, at the instance of Hume and Robertson (new ed., 3 vols. 8vo, 1841-3).

BAILLOT, Pierre Marie François de Sales, a French violinist, born at Passy, near Paris, Oct. 1, 1771, died in Paris, Sept. 15, 1842. He was a professor in the conservatoire for many

years, and wrote several treatises and addresses on musical subjects. He travelled in Russia, Belgium, Holland, and England, and was considered without a rival in the severely classical style.

BAILLY, Jean Sylvain, a French astronomer and statesman, born in Paris, Sept. 15, 1736, guillotined Nov. 12, 1793. His father was an artist, and intended that he should follow the same profession; but he was attracted more by poetry and belles-lettres until his acquaintance with La Caille, when he turned his attention to astronomy. In 1763 he was admitted to the academy of sciences, and published a reduction of La Caille's observations on the zodiacal stars. He competed with Lagrange for the academy's prize on the theory of Jupiter's satellites in 1764. His treatise on that subject, published in 1766, contains a history of that department of astronomy. In 1771 he published a treatise on the light of those bodies. The 1st volume of his "History of Astronomy" appeared in 1775, the 4th in 1788. To these he afterward added a volume on oriental astronomy. He also published letters to Voltaire on the origin of the sciences and of the people of Asia, and on Plato's Atlantis. In 1784 he was chosen secretary of the academy of sciences and admitted to the French academy, and the next year to the academy of inscriptions. About this time he wrote his graceful and eloquent *éloges* on Charles V., Corneille, Leibnitz, Molière, and La Caille. In 1784 he was one of the commissioners to investigate Mesmer's discoveries, and made a clear and sagacious report on the subject. He espoused the democratic cause in the revolution, was elected from Paris in 1789 first deputy of the *tierra-état*, and was chosen president of the popular division of the states general in Versailles. When the national assembly was formed, he retained the presidential chair, and dictated the oath by which the members swore that they would "resist tyrants and tyranny, and never separate until they had secured a free constitution." In July, 1789, he was chosen mayor of Paris, and discharged his duties during 26 months with great firmness and wisdom. His vigor in suppressing a riotous demonstration on the Champ de Mars, July 17, 1791, and in defending the queen from charges brought against her, having lessened his popularity, he resigned his office in September, but was induced to retain it two months longer. He then lived for some time at Nantes, and afterward with Laplace at Melun; but in 1793 he was seized by the Jacobin soldiery, and dragged to Paris, where he was charged with being a royalist conspirator and executed. He is considered one of the noblest victims of the reign of terror. Several posthumous works of his have appeared; the most noted are an "Essay on the Origin of Fables and Ancient Religions," and his "Memoirs of an Eye-witness of the Revolution," embracing the period from April to October, 1789.

BAILEMENT (Fr. *bailler*, to deliver), in law, the delivery of a thing upon some trust, express or implied, usually the redelivery of the thing itself or its equivalent, or some disposition of it according to the direction of the bailor. The different kinds of bailment are: 1, a deposit for safe keeping; 2, lending or hiring for use of bailee; 3, a pledge or pawn as security for something done or to be done by pawnee; 4, delivery of a thing for the purpose of having work done upon it, or of being carried to some place designated. When the bailment is exclusively for the use of the bailee, as where a thing is borrowed for use by bailee, the strictest degree of care is required. If the trust is to keep the thing bailed or to do something in respect to it for the benefit of bailor without compensation, ordinary care, such as a man bestows upon his own property, is all that is required; and if he is habitually careless about his own affairs, he is not bound to do more for another than he does for himself. If the trust is for mutual benefit, as when goods are to be kept or something done respecting them for a reward, ordinary diligence is to be exercised, such as prudent and careful men would give to their own affairs. In respect to two classes of bailments, the rule of law is peculiar, viz., the cases of innkeepers and common carriers; both of whom are made responsible absolutely for the goods intrusted to them, except against inevitable accident called the act of God, and against the act of the public enemy. It is not sufficient that they use the utmost care; they are held to be insurers of the safety of the goods except as above specified. The innkeeper therefore is answerable for the property of his guest, even if lost by theft or burglary; and a carrier for the goods in his charge, against every casualty except loss by lightning or tempest, and he is not exonerated in case of destruction by fire, in which last particular the rule is even more severe than it is in respect to the innkeeper. The English law of bailment was quite imperfect until the time of Lord Holt, who resorted to the civil law to supply the deficiency then existing in the adjudged cases. His classification, as given in *Coggs v. Bernard*, Lord Raymond's Reports, 909, is famous. Sir William Jones was the first English writer who treated of this subject at length; but he had been anticipated in France by Pothier, whose work on "Obligations" is now an acknowledged authority in English and American law. The American treatises of Justice Story and Mr. Edwards give the results of the more recent cases.

BAILY, Edward Hodges, an English sculptor, born at Bristol, March 10, 1788, died May 22, 1867. His father was a ship carver. The son was placed in a counting house, but his taste for art led him to take up the vocation of a modeller in wax, in which he gained some reputation. In 1807 he went to London, and entered the studio of Flaxman. From the society of arts and sciences he received the

silver medal, and from the royal academy he gained both the gold and silver medals, and a purse of 50 guineas; his subject on the latter occasion being "Hercules restoring Alceitis to Admetus." At the age of 25 he produced the statue of "Eve at the Fountain." Among his other works were "Hercules casting Lichas into the Sea," "Apollo discharging his Arrows," the colossal statue of Nelson in Trafalgar square, well known statues of Earl Grey, Sir Astley Cooper, and Sir Robert Peel, portions of the sculptures at Buckingham palace, "Eve listening to the Voice," "Preparing for the Bath," "The Graces," "The sleeping Nymph," and "The fatigued Huntsman."

BAILY, Francis, an English astronomer, born in 1774, died in 1844. He was a London broker, and author of several works on annuities, assurances, and kindred subjects, but devoted the last years of his life almost wholly to the service of the astronomical society and the British association. He prepared the astronomical society's star catalogue, and contributed many important papers to its memoirs. Sir John Herschel wrote his biography.

BAIN, Alexander, a Scottish philosopher, born in Aberdeen in 1818. He was educated at Marischal college, and was teacher of moral and natural philosophy there 1841-'5, professor of natural philosophy at the Andersonian university 1845-'6, assistant secretary of the metropolitan sanitary commissioners 1847-'8, and of the general board of health 1848-'50, examiner in logic and moral philosophy at the university of London 1857-'62, examiner in moral science for the India civil service 1858-'60 and 1863, and professor of logic and English literature in the university of Aberdeen 1860-'64. In the latter year he again became examiner in the university of London. He became a contributor to the "Westminster Review" in 1840, wrote for the "Cyclopaedia" and other publications of the Messrs. Chambers, including text books on various sciences for their school series, and edited Paley's "Moral Philosophy," with dissertations and notes (1852). His principal works are: "The Senses and the Intellect" (1855); "The Emotions and the Will" (1859); "The Study of Character" (1861); "English Composition and Rhetoric" (revised ed., 1866); "Mental and Moral Science" (1868); and "Logic" (1870).

BAINBRIDGE, William, an American naval officer, born in Princeton, N. J., May 7, 1774, died in Philadelphia, July 28, 1833. He had a command in the merchant service, when, upon the reorganization of the navy in 1798, he received the commission of lieutenant. In September of that year, while cruising off Gadeloupe, his vessel was captured by a French squadron, and he and his officers and men were held as prisoners until December following. On his return to the United States he was promoted, and appointed to the command of the brig Norfolk, in which vessel he cruised in the West Indies during a large portion of the

trouble with France. In May, 1800, he was promoted to the rank of captain, and appointed to the frigate *George Washington*, which was ordered to carry a large amount of tribute to the regency of Algiers. After the completion of this mission the dey compelled him, by threats of capture and of a declaration of war, to convey an Algerine embassy to Constantinople, where Bainbridge during a stay of two months was treated with great distinction. He returned to the United States in 1801, and was soon employed in the Mediterranean again in command of the frigate *Essex*. Upon the declaration of war against the United States by Tripoli in 1803, he was appointed to the frigate *Philadelphia*, one of the vessels of the squadron sent against that power under the command of Commodore Edward Preble. He displayed great vigor in this service, capturing on Aug. 26 a Moorish frigate with an American prize; but on Oct. 31 his vessel ran aground, and was captured and carried to Tripoli, where Bainbridge and his men to the number of 315 were retained as prisoners till the close of the war, a period of 19 months. On his return to the United States in 1805, Bainbridge was received with very general demonstrations of kindness and respect. A court of inquiry was held for the loss of the *Philadelphia*, and the result was an honorable acquittal; and under the act of April, 1806, reorganizing the navy, he became the seventh on the list of captains. On the declaration of war in 1812 Capt. Bainbridge united with Capt. Stewart in an effective remonstrance against the government's project of laying up the ships of war through fear of the immense superiority of the enemy at sea. In September, 1812, Bainbridge, now a commodore, was appointed to the command of a squadron, consisting of the *Constitution*, 44 guns (flag ship), *Essex*, 32, and *Hornet*, and sailed from Boston on Oct. 25 for a cruise. On Dec. 26, in a severe engagement off San Salvador, the *Constitution* captured the British frigate *Java*, 49 guns, the *Java* losing her commander, Capt. Lambert, and 174 men, and the *Constitution* 33 men. On his return to the United States Bainbridge was everywhere received with enthusiasm; congress voted a gold medal to him, and silver ones to his officers, and \$50,000 were distributed to the crew as prize money. In 1815 he was appointed to the command of a squadron of 20 sail, intended to act against Algiers, but peace was concluded before it reached the Mediterranean. Bainbridge, however, during this command, settled disputes with the Barbary powers. Upon his return he was appointed to command afloat at Boston. In 1819-'21 he again commanded in the Mediterranean. From this time until his death he was almost constantly employed in important shore service, being for some time president of the board of navy commissioners.

BAIRAM, a Persian term designating the two principal holidays of Islam, which are celebrated with great festivities, especially the

little Bairam (Turk. *kutchuk bairam*; Arab. *aid el-saghir*, the little feast, or *aid el-fethr*, the feast of fast-breaking). It succeeds Ramadan, beginning at sunrise of the first day of the month of Shevval, and lasts three days, the mosques being illuminated, the sultan holding public receptions, salutes being fired, and every one who can afford it putting on new dresses. The Turkish capital and its environs exhibit during this period great animation. Sixty days after the little Bairam is the festival of the great Bairam (Turk. *buyuk bairam*, generally *kurban bairam*; Arab. *aid el-kebir*, the great feast, or *aid el-kurban*, the feast of sacrifice). It begins on the 10th of the month of Zilhije, and lasts four days, during which sheep and oxen are sacrificed, and the same festivities observed as during the little Bairam. Every family or two families in conjunction kill a lamb. At Mecca sheep, oxen, and camels are slaughtered, and the flesh is distributed among the poor pilgrims. The sultan on both occasions visits the mosque with great ceremony. He also holds public receptions attended by the foreign ministers and Turkish officials, the latter being treated to a banquet, and 16 of them receiving presents of robes furred with sable. Formerly the ambassadors also received presents.

BAIRD, Sir David, a British general, born at Newbyth, Scotland, Dec. 6, 1757, died Aug. 18, 1829. He went to India as captain in the 78d Highlanders, and in 1780 was wounded and taken prisoner in the disastrous affair near Conjeveram in the Carnatic, where Hyder Ali destroyed an entire British detachment. He was held captive at Seringapatam nearly four years, and when that fortress was taken by assault in 1799, Baird, then a major general, commanded and led the storming party. For his gallantry on this occasion he received the thanks of parliament. Dissatisfied with the preference shown to Wellesley, he obtained leave of absence in 1803, and returned to England, where he was received with great distinction. In 1805 he commanded an expedition against the Dutch settlements at the Cape of Good Hope; in 1807 he led a division in the attack on Copenhagen; and in 1808 he joined Sir John Moore in Spain, succeeding to the command when that officer fell at Corunna. He was severely wounded, however, and obliged to retire from active service. He was knighted in 1804, and created a baronet after the victory of Corunna in 1809.

BAIRD, Robert, D. D., an American clergyman and author, born of Scotch parentage in Fayette county, Penn., Oct. 6, 1798, died at Yonkers, N. Y., Nov. 15, 1863. He was educated at Jefferson college, Pennsylvania, and at the Princeton theological seminary, and in 1822 took charge of an academy in Princeton. He became agent of the missionary society of New Jersey in 1828, and did much toward laying the foundation of the present system of public school education in that state. In 1829

he was appointed agent of the American Sunday school union, and succeeded in raising the annual revenue of the society from \$5,000 to \$28,000. In 1835 he visited Europe, and remained abroad, with the exception of two brief visits home, for eight years, striving to revive the Protestant faith in the southern countries of Europe, and to promote the cause of temperance in the northern countries. Upon the formation of the foreign evangelical society, afterward merged in the American and foreign Christian union, he was made its agent and corresponding secretary. In the summer of 1842 Dr. Baird published in Scotland a work entitled "Religion in America," which was translated into several of the continental languages. Among his other works were "A Visit to Northern Europe," "Protestantism in Italy," "History of the Albigenses, Waldenses, and Vaudois," and "History of the Temperance Societies of the United States."

BAIRD, Spencer Fullerton, an American naturalist, born at Reading, Penn., Feb. 8, 1828. He was educated at Dickinson college, and in 1848 became professor of natural science in that institution. In 1850 he was appointed assistant secretary of the Smithsonian institution in Washington, which position he still occupies (1878). His first scientific and literary work of any magnitude was a translation from the German of the *Bilder-Atlas* of Heck, a supplement to the *Conversations-Lexikon* of Brockhaus, in which he was assisted by several scholars in different specialties ("Iconographic Encyclopædia," 4 vols. 8vo of text and 2 vols. 4to of plates, New York, 1849 *et seq.*). His next important publication was the report on the mammals of North America, constituting vol. viii. of the "Reports of the Survey of the

Railroad Routes to the Pacific." This, which appeared in 1857, was followed in 1858 by a still more extended work (vol. ix. of the series) upon the birds of North America. In 1864 he commenced the publication of a work, under the auspices of the Smithsonian institution, upon the birds of the new world generally, under the title of "Review of American Birds in the Museum of the Smithsonian Institution." He has also been engaged for several years in preparing a new account of the birds of North America, which is now (1878) in press, and in which he is assisted by Dr. T. M. Brewer of Boston. In 1871 he was appointed by President Grant United States commissioner of fish and fisheries, for the purpose of making inquiries into the causes of the decrease of the supply of food fishes of the United States, and the methods of restoring it. Numerous minor papers upon mammals, birds, reptiles, and fishes of North America have appeared from his pen in the "Proceedings" of the academy of natural sciences of Philadelphia, the New York lyceum of natural history, and elsewhere.

BAIREUTH, or *Bayreuth*, a city of Bavaria, capital of the circle of Upper Franconia, on the left bank of the Red Main, about 50 m. by railway N. N. E. of Nuremberg; pop. in 1871, 17,837, chiefly Protestants. The town is well built and partly surrounded by ancient walls. It has a castle, riding school, gymnasium, theatre, public library, and public garden, an active trade, principally in grain, several breweries and distilleries, and manufactures of woollen and cotton fabrics, leather, and earthenware. There are three palaces in the vicinity. The Hermitage palace is a fanciful building, where Frederick the Great and his sister the margravine of Baireuth resided. Schwanthaler's

bronze statue of Richter, who died and was buried here in 1825, is in the Gymnasiumplatz, and an inscription in gold letters marks his house in the Friedrichstrasse. In front of the old castle, now used for government offices, is a monument in honor of Maximilian II. erected in 1860, and in the square in front of the new castle stands an equestrian statue of the margrave Christian Ernst. The corner stone of a great festival theatre, designed by Richard Wagner for the promotion of the German lyric drama, and especially for the performance of his own *Nibelungen* trilogy, was laid at Baireuth in 1872.—Baireuth was formerly the capital of the principality of the same name (previously of Kulmbach), the history of which was long associated with that of the principality of Anspach. Christian, a son of the elector John George of Brandenburg, who at the beginning of the 17th century succeeded as ruler of Baireuth, while his brother became prince of Anspach, removed the capital from Kulmbach to Baireuth. In 1763, on the death of the margrave Frederick, who had greatly promoted public prosperity, Baireuth and Anspach were united into one principality, and both ceded to Prussia in 1791. After passing under the power of the French in 1806, Baireuth was transferred to Bavaria in 1810.

BAIUS, or **De Bay**, **Michael**, a Flemish theologian, born at Melin in Hainault in 1513, died Sept. 16, 1589. He was educated at the university of Louvain, in which he became a professor and ultimately chancellor. His zealous advocacy of the doctrine of St. Augustine brought him into collision with his colleagues, who in 1552 laid 18 of his most objectionable dogmas before the university of Paris, which in 1560 condemned 15 of them as heretical and the other three as false. Notwithstanding this decision, the Spanish court sent Baius as its representative to the council of Trent in 1563. In the two following years he published various controversial works, which called forth on Nov. 1, 1567, the denunciatory bull of Pope Pius V., which anathematized 76 of his favorite dogmas, but did not name him. Baius afterward recanted and professed obedience, was engaged a few years later in similar controversies, and made a second retraction in 1580. The contest was renewed from time to time until his death. His works were published at Cologne in 1696, and his doctrines subsequently became the basis of Jansenism.

BAJAZET, **Bajazid**, or **Bayazid**. **I.** An Ottoman sultan, born in 1347, died in 1403. He succeeded his father Amurath I., who was killed at the hour of victory in the battle of Kosovo in 1389, and to prevent any trouble with his family strangled his younger brother. He was incessantly occupied in the first years of his reign in subduing his rebellious subjects or adding to his conquests. In Europe his armies penetrated beyond the Danube, into Wallachia and Hungary, subdued the countries around

the Balkan, and devastated parts of Greece. He brought the whole of Asia Minor under the Turkish government. In 1391 he subdued Philadelphia, the last of the Greek cities of Asia, and in 1394 laid siege to Constantinople, continuing it for years. European nations became alarmed at his progress, and Sigismund, king of Hungary, with a large army reinforced by a select body of French troops, set out to check his progress; but in 1396 Bajazet utterly routed his army near Nicopolis. He overran the whole of the Morea, but his career of conquest was checked by Tamerlane, who invaded his possessions in Asia Minor. The two conquerors met on the plains of Angora in Galatia with immense armies in 1402, and Bajazet was totally defeated and taken prisoner, and, according to accounts which modern historians do not consider literally true, was carried about in an iron cage till his death. On account of the rapidity of his movements Bajazet was called Ilderim (the lightning). He was succeeded by Mohammed I. **II.** An Ottoman sultan, son of Mohammed II., the conqueror of Constantinople, born in 1447, died in 1512. On his father's death in 1481, his brother Zizim disputed the succession. He was defeated, however, and fled to Egypt, and afterward to Rhodes, whence D'Aubusson, the grand master, sent him to France. Bajazet's hatred pursued him in his exile, and is believed to have procured his death by poison. Bajazet was continually engaged in war, with varying success, against the Venetians, the Egyptians, and the Persians. His reign was brought to a close by the rebellion of three of his sons, claimants of the throne, in which Selim, the youngest, was at last successful, and Bajazet abdicated in his favor, and was poisoned by him a few days later. During the reign of Bajazet II. the Venetians obtained the right to appoint a consul at the Sublime Porte, and treaties were concluded with Poland and the czar.

BAJAZID, or **Bayazid**, a fortified town of Turkish Armenia, 150 m. E. S. E. of Erzerum, S. W. of Mount Ararat; pop. variously estimated at from 5,000 to 15,000, mostly Kurds. It lies around a hill crowned by a citadel, and has a palace, arsenal, mosque, and monastery. The town, which is the capital of a sanjak, has declined since the Russian conquest of Georgia.

BAKACS, **Tamas**, a Hungarian statesman and prelate, died in 1521. The son of a serf, he became by his talents secretary of King Matthias Corvinus, who ennobled him, and after whose death he labored for the accession of Ladislas II. of Bohemia to the throne (1490). The latter accordingly made him chancellor, which office he relinquished in 1505 for a cardinal's hat, having previously been the incumbent of various episcopal sees, and finally of the archbishopric of Gran. He even aspired to the holy see, but succeeded only in being appointed legate in Hungary, and in

being allowed to hold simultaneously, contrary to law, many ecclesiastical endowments and functions. On the death of Pope Julius II. (1513) he revisited Rome, still in the hope of winning the papacy; and when this hope was blasted by the election of Leo X., he obtained permission to preach a crusade against the Turks. But the army of peasants and vagabonds which rallied under Dózsa in obedience to his appeals, instead of fighting the infidels, turned their arms against the Hungarian nobility and committed frightful ravages, until they were routed by John Zápolya. This peasants' war, and the somewhat suspicious part played in the whole movement by Bakacs, have been graphically described in *Magyarország 1514-ben* ("Hungary in 1514"), by Baron Eötvös (3 vols., Pesth, 1847-'8). The families Erdödi and Pálffy inherited the vast fortune of Bakacs.

BAKALAHARI, the oldest of the African Bechuana tribes, occupying the great Kalahari desert, between the Orange river, lat. 29° S., and Lake Ngami, and between lon. 24° and the Great Fish river. They are found roaming with the Bushmen, but retain the characteristics of the Bechuana tribes, and exhibit an inclination to industrial pursuits and settled life. They cultivate the thin soil, rear goats, and carry on a small traffic in furs.

BAKER, the name of counties in four of the United States. **I.** A central county of Alabama, bounded E. by the Coosa river, and watered by affluents of that stream and of the Alabama and Cahawba; area, 665 sq. m.; pop. in 1870, 6,194, of whom 1,187 were colored. The Selma, Rome, and Dalton, and the South and North Alabama railroads traverse the county. The chief productions in 1870 were 11,728 bushels of wheat, 131,311 of Indian corn, 6,238 of oats, 29,571 of sweet potatoes, and 1,360 bales of cotton. Capital, Grantville. **II.** A N. E. county of Florida, bounded N. and N. E. by Georgia, from which it is partly separated by the N. fork of the St. Mary's river; area, 570 sq. m.; pop. in 1870, 1,325, of whom 290 were colored. It is watered by several streams and small lakes, and the Okefenoke swamp extends in the N. W. portion. The Florida Central railroad passes through the county. In 1870 the county produced 10,403 bushels of corn, 1,715 of oats, 6,150 of sweet potatoes, 83 bales of cotton, 29 hhds. of sugar, and 3,075 gallons of molasses. Capital, Sanderson. **III.** A S. W. county of Georgia, bounded S. E. by Flint river and intersected by Ichawaynochaway creek; area, 1,400 sq. m.; pop. in 1870, 6,843, of whom 4,955 were colored. The surface is level and the soil fertile. The chief productions in 1870 were 153,986 bushels of Indian corn, 5,684 of sweet potatoes, and 5,556 bales of cotton. Capital, Newton. **IV.** A S. E. county of Oregon, bounded E. by Idaho, and S. by Nevada; area about 6,000 sq. m.; pop. in 1870, 2,804, of whom 680 were Chinese. It is watered by the Owyhee and Malheur rivers, and

other branches of the Saptin or Snake, which runs on its E. border. The Blue mountains skirt the N. W. corner. The county has mines of gold and silver. In 1870 the chief productions were 2,306 bushels of wheat, 37,426 of oats, 17,732 of barley, 7,377 of potatoes, and 1,944 tons of hay. Capital, Auburn.

BAKER, Edward Dickinson, an American senator and soldier, born in London, England, Feb. 24, 1811, killed at the battle of Ball's Bluff in Virginia, Oct. 21, 1861. The family emigrated to the United States in 1815, settling first in Philadelphia, and afterward at Belleville, Ill. Having been admitted to the bar, Baker took up his residence at Springfield, Ill. He was elected member of the legislature in 1837, of the state senate in 1840, and representative in congress in 1844. When the war with Mexico broke out in 1846, he resigned his seat in congress, became colonel of a regiment of volunteers from Illinois, was present at the siege of Vera Cruz, and commanded a brigade at the battle of Cerro Gordo. In 1848 he was again elected to congress, but declined, having become connected with the Panama railway. In 1852 he settled in California, where he practised law with success, took an active part in political discussions, and was nominated by the republicans for congress, but was not elected. He removed to Oregon, and in 1860 was elected to the United States senate from that state. When the civil war broke out he raised a regiment in New York and Philadelphia, of which he was appointed colonel, having declined a commission as general. At the battle of Ball's Bluff, where he commanded a brigade, he received several bullets, one of which passed through his head, killing him on the field.

BAKER, Henry, an English naturalist and teacher of the deaf and dumb, born in London, May 8, 1698, died Nov. 25, 1774. He was brought up to the bookselling business, but afterward devoted himself to scientific studies, and especially to observations with the microscope and to botany. He introduced into England several valuable exotic plants; among others, the large Alpine strawberry, and the *rheum palmatum*, or true rhubarb. He was a member of the society of antiquaries and of the royal society. He contributed several papers to the "Philosophical Transactions," and published, besides his microscopic observations, a small collection of poems. Many years of his life were spent in the instruction of deaf mutes, whom he taught to articulate after the method of Wallis and Holden. He married the youngest daughter of Daniel Defoe.

BAKER, Osmon Cleander, D. D., an American clergyman, bishop of the Methodist Episcopal church, born in Marlow, N. H., July 30, 1812, died Dec. 20, 1871. At the age of 15 he entered Wilbraham academy, and in 1830 went to the Wesleyan university, Middletown, Conn., where he studied three years, receiving a degree, although bad health prevented him from

finishing the usual studies. In 1834 he was appointed teacher in Newbury seminary, Vt., and in 1839 became its principal. This position he occupied till 1844, when he entered the work of the pastorate. In 1847 he was elected to a chair in theology in the Methodist general Biblical institute at Concord, N. H., since become the school of theology of the Boston university. Subsequently he was chosen president of this institution, where he remained till 1852, when he was elected bishop. His chief labors were in behalf of theological education. Among other writings, he was the author of a commentary on the ecclesiastical law and polity of the Methodist Episcopal church.

BAKER, Sir Samuel White, an English explorer, born June 8, 1821. In 1848, in conjunction with his brother, he established a model farm and coffee estate in the island of Ceylon. He gave some account of his life there in "The Rifle and the Hound in Ceylon" (1853) and "Eight Years' Wanderings in Ceylon" (1855). In 1861 he organized a large expedition for the purpose of discovering the head waters of the Nile, with the especial design of meeting and succoring Speke and Grant, who had set out from Zanzibar for the same purpose. Baker, accompanied by his wife, a Hungarian by birth, set out from Cairo, April 15, 1861, and on the 18th of June reached the junction of the Atbara with the Nile. For nearly a year he explored the regions of Abyssinia whence comes the Blue Nile, and in June, 1862, returned to Khartoom, at the junction of the Blue and the White Nile. Here he organized a party of 96 persons to explore the course of the White Nile. They set out Dec. 18, 1862, sailing southward up the river. They reached Gondokoro, lat. 4° 55' N., lon. 31° 46' E., on Feb. 2, 1863. Here on the 15th Baker was met by Grant and Speke, who coming from the south had discovered the Victoria N'yanza, which they believed to be the ultimate source of the Nile. They had left the river for some distance, but thought it probable that there was still another great lake connected with the Victoria N'yanza. Baker, resolved to supplement the explorations of Grant and Speke, started from Gondokoro by land, March 26, 1863, the route being first eastward, then nearly south, then trending toward the west. The journey was adventurous and toilsome, and Mrs. Baker suffered a sunstroke which nearly cost her life. On March 14, 1864, Baker came in sight of a great fresh-water lake, heretofore unknown, to which he gave the name of Albert N'yanza. (See N'YANZA.) After navigating a small portion of the lake, he set out on his homeward journey early in April, 1864; but owing to illness and the disturbed condition of the country, he did not reach Gondokoro until March 23, 1865. He then returned to England, where he received the honor of knighthood, and published an account of his explorations, "The Albert N'yanza" (London, 1866). In 1869 he returned to Africa, was

created a pasha by the khedive of Egypt, and placed at the head of an expedition to put down the slave trade carried on by the natives and Arabs in the basin of the Nile.

BAKEWELL, a market town of Derbyshire, England, situated on the river Wye, near its junction with the Derwent, 20 m. N. N. W. of Derby; pop. in 1871, 10,727. It is the property of the duke of Rutland, whose seat, Had-don Hall, is two miles from the town. It has a spacious cruciform church founded in Saxon times, showing specimens of Gothic architecture of different periods, and on the opposite bank of the Wye are traces of a castle built by Edward the Elder in 924. Cotton mills were first established here by Arkwright, and there are coal and lead mines in the vicinity. There are also chalybeate springs and warm baths, formerly much resorted to. Chatsworth house, the splendid residence of the duke of Devonshire, is three miles distant.

BAKEWELL, Robert, an English agriculturist, born at Dishley in Leicestershire about 1725, died Oct. 1, 1795. He succeeded his father in 1760 as proprietor of the Dishley farm, where he introduced the long-horned breed of cattle and paid special attention to the development of sheep. His horses and pigs were also noted in their day. His aim was to secure cattle that would fatten on the smallest quantity of food. Mr. Bakewell introduced into English agriculture the practice of flooding meadows. He never contributed anything to literature, but Arthur Young, in his "Annals of Agriculture," fully described and praised his plans and improvements.

BAKHUT, a town of S. Russia, in the government and 138 m. E. of the town of Yekaterinoslavl; pop. in 1867, 10,392. The town has large establishments for rendering tallow, and near it are coal mines and alabaster quarries.

BAKHTCHISERAI (Turkish, palace of gardens), a Tartar town of the Crimea, now included in the Russian government of Taurida, in lat. 44° 47' N., lon. 33° 54' E., 23 m. N. E. of Sebastopol, in a long deep valley on the banks of the Tchuruk Su; pop. in 1867, 11,448, of whom 1,500 were Carait Jews, Greeks, and Armenians, and the rest Tartars. The *khan serai*, or palace of the ancient khans of the Crimea, consists of a range of spacious buildings one story high, richly adorned with arabesques and inscriptions, a splendid mosque, beautiful marble fountains, and luxuriant gardens. The manufactures consist of morocco leather, saddlery and other leather articles, *beeza* (a spirit distilled from millet), silks, common cutlery, gold and silver plate, pottery, and arms. About four miles distant are the renowned seat of the Caraites, Tchufut Kalé, or Jews' Castle, and a deserted monastery containing 70 cells hewn out of the solid rock. Bakhtchiserai first became the residence of the khans about 1475. In the 16th century their dominion extended not only over the Crimea, but over all the outlying

territory from the Danube to the Caucasus. Gradually, however, Russia undermined their authority, until in 1783 it became extinct. During the siege of Sebastopol (1855) Bakh-tchiseraï was the headquarters of the Russian army.

BAKHTEGAN, a lake of Persia, in the province of Fars, in lat. $29^{\circ} 30' N.$, and between lon. $58^{\circ} 30'$ and $54^{\circ} 30' E.$; length E. and W. upward of 60 m.; breadth 8 m. It dries up in summer, leaving immense quantities of salt.

BAKHTISHWA, the name of a Christian Nestorian family, which during the 8th, 9th, 10th, and 11th centuries gave six famous physicians to the court of Bagdad. Caliph Al-Hadi, after having been restored to health by the skill of Ben Giurgis Bakhtishwa in 786, proposed that all the physicians who had unsuccessfully practised upon him should be put to death; but Bakhtishwa saved the lives of his colleagues by administering poison to the caliph. At the beginning of the 9th century Giabril ben Giurgis ben Bakhtishwa, after helping Haroun al-Rashid over an apoplectic fit, was sentenced to death because the caliph had a relapse. His life was only saved by the death of the caliph. The most learned of the Bakhtishwas was Abu Sa, who flourished about the middle of the 10th century. He is the reputed author of a medical work in 50 chapters, dedicated to Caliph Motaki, and entitled the "Garden of Medicine."

BAKONY, or **Forest of Bakony**, a mountain range in Hungary, S. of the Danube, between the Raab and Lake Balaton, separating the great and little Hungarian plains. Its average height is about 2,000 ft. It is crowned with dense forests, and has quarries of very fine marble. Immense herds of swine are fed in the forest, and the keepers figure as robbers in Hungarian literature.

BAKU, or **Bakoe**. I. Formerly an independent khanate, now a government of Russia, in Transcaucasia, bordering on the Caspian sea, and comprising the territory of Shirvan and part of Daghestan; area, 14,922 sq. m.; pop. in 1867, 486,229, including Russians, Caucasians, Armenians, and Parsees. It is traversed by the easternmost ranges of the Caucasus, and watered by the Kur and the Aras. The peninsula of Apsheron, comprised within this government, is remarkable for its mud volcanoes and naphtha springs. Near the town of Baku there are about 100 bituminous springs, several of which are worked, producing white and black naphtha. The principal sources are situated at a spot called Balegan, about 6 m. from the city of Baku. The quantity annually obtained in the district amounts to about 36,000 lbs. of the pure and 9,600,000 lbs. of the black naphtha. The naphtha is used by the natives for illuminating purposes. The country for several miles round the town of Baku is impregnated with inflammable matter. About 15 m. N. E. of the town is a fire temple of the Guebres nearly a mile in circumference, from the

centre of which rises a bluish flame. Here are some small houses, and the inhabitants when they wish to smother the flame cover the place, enclosed with walls, by a thick loam. When an incision is made in the floor, and a torch applied, the gas ignites, and when the fire is no longer needed it is again suppressed by closing the aperture. Not far from the town there is a boiling lake which is in constant motion, and gives out a flame altogether devoid of heat. After the warm showers of autumn the whole country appears to be on fire, and the flames frequently roll along the mountains in enormous masses and with incredible velocity. The fire does not burn, nor is it possible to detect the least heat in it, nor are the reeds or grass affected by it. These appearances never occur when the wind blows from the east. In former times the burning field was one of the most celebrated *ateshgahs* (shrines of grace) among the Guebres. Previous to its occupation by the Russians a voluntary human sacrifice was annually offered here—a youth who leaped with his horse into one of the fissures. A few adherents of this sect still make pilgrimages to the great ateshgah to worship the fire and perform penitential exercises, chiefly by night. The place is a walled quadrangle with an altar raised on a flight of steps in the centre. At each of the four corners stands a chimney 25 ft. high, from which issues a flame 3 ft. long. Round the walls of this sanctum are a number of cells in which the priests and Guebres reside. The peninsula is also remarkable for its salt formation: in different parts of it there are 10 salt lakes, only one or two of which are worked, yielding annually about 10,000 tons. There are no trees in this peninsula, but portions of the territory have a layer of mould on which are raised wheat, barley, maize, melons, fruits, rice, cotton, and saffron. Opium is prepared, and a species of red and highly flavored onion not found elsewhere is cultivated. II. A seaport town on the W. coast of the Caspian, the capital of the preceding government, in lat. $40^{\circ} 22' N.$ and lon. $49^{\circ} 40' E.$, situated on the southern shore of the peninsula of Apsheron; pop. in 1867, 12,383, chiefly Mohammedans. The houses, terraced like those of other oriental towns, are built of naphtha and earth. The town is protected by a double wall built in the time of Peter the Great, has a custom house, military school, 16 Mohammedan private schools, 23 mosques, Russian, Greek, and Armenian churches, and a palace of the ancient khans built about the 7th century, and now used as an artillery arsenal. The walls were once washed by the Caspian, but they are now 15 ft. from it; and in other places the sea has encroached upon the land, and the ruins of submerged buildings are discovered at a depth of 18 ft. The port of Baku is the most important on the Caspian, and a principal Russian naval station. The chief articles of trade are naphtha, iron, silk, shawls, linen and woollen goods, cotton, tobacco, indigo, fruits, fish, salt, and

saffron. There are no factories. Baku existed in the 4th century. It fell into the hands of the Saracens, and after the downfall of the caliphate it passed into the power of the princes of Shirvan. In 1509 it was annexed to the Persian monarchy, and later was taken by the Turks, but recaptured by Shah Abbas I. In 1723 the city capitulated to the Russians under Matushkin, but was returned to the Persians at the peace of 1735. Later it was taken by the inhabitants of the Caucasus, and in 1806 it was again taken by the Russians under Gen. Bulkhakoff and finally annexed to Russia.

BAKUNIN, Mikhail, a Russian revolutionist, born at Torzhok, Tver, in 1814. He belongs to an old family, left the military service for the study of philosophy, and became conspicuous by his affiliations with revolutionary Frenchmen, Germans, and Poles, and as a resolute and reckless agitator. He resided after 1841, when he left Russia, in Germany, France, and Switzerland; and, declining to return to Russia, his estates were confiscated. In 1847 he was expelled from France at the request of the czar for having made an inflammatory speech in favor of a Polish-Russian alliance for the overthrow of Russian despotism. After the revolution of 1848 he was prominent at the Slavic congress in Prague and in the ensuing conflict, after which he fled to Berlin. Expelled from Prussia, he appeared in May, 1849, as a member of the revolutionary government and as the most daring leader of the outbreak in Dresden. Captured at Chemnitz after the suppression of the insurrection, he was incarcerated for eight months in a Saxon fortress. His sentence to death in May, 1850, being commuted to perpetual imprisonment, he was surrendered to the Austrian government, which likewise condemned him to death and commuted the sentence, and which in its turn gave him up to Russia, where he was confined in St. Petersburg and in Schlüsselburg till after the Crimean war, when he was sent to Siberia. He availed himself of a permission to settle in the Amoor Country for escaping to Japan, and reached the United States early in 1861, after which he returned to Europe, lately residing chiefly in Switzerland, still engaged more or less in revolutionary and journalistic enterprises. He is the author of *Russische Zustände* (Leipzig, 1847), and of other publications.

BALAAM (Heb. *Bi'am*), a soothsayer and diviner of Pethor, on "the river" (Euphrates), whom Balak, king of Moab, alarmed at the discomfiture of his neighbors the Amorites by the Hebrews, sent for to pronounce a curse upon the invaders. Balaam refused, saying that he could not curse the people whom God had blessed; but upon being further urged, he agreed to say only what should be commanded by God. He set out, riding upon an ass; but on the way he was met by the angel of the Lord, visible to the ass, but not to the rider. The ass refused to pass the opposing angel, and three times turned out of the way, being each

time beaten by Balaam. At last the ass spoke in a human voice, asking why he had been beaten. Then Balaam's eyes were opened, and he saw the angel of the Lord standing with a drawn sword to bar his way. The angel told him to go on to Balak, but he must only say what should be commanded to him. Balaam went to Balak, and after due sacrifices delivered his message, which proved to be a blessing upon the Hebrews, instead of the desired curse. This was repeated four times, with the same result; and on the last occasion Balaam predicted that the Israelites should overthrow Moab, Edom, Amalek, and other neighboring tribes. Some Biblical critics consider the story of Balaam (Numbers xxii.-xxiv.) as an interpolation; other expounders have interpreted the speaking of the ass as a vision or trance in which the diviner thought he saw an angel, and fancied that he heard the ass speaking.

BALAKLAVA, a small seaport town of Russia, in the government of Taurida, on the S. W. coast of the Crimea and a small bay of the Black sea, about 8 m. S. S. E. of Sebastopol; pop. about 750. Known in antiquity as Symbolon Portus, the bay of Balaklava was called in the middle ages Cembalo and Bella Chiava, being a possession of the Genoese, who built a fortress on the heights above the harbor. Catharine II. sent to Balaklava 2,000 Greek and Armenian soldiers as guards of the coast, and their descendants formed from 1795 to 1859 the so-called Balaklava-Greek battalion. In the Crimean war, the British troops under Lord Raglan, a few days after their landing in the peninsula, compelled the small Russian garrison to surrender, Sept. 26, 1854, and established their naval headquarters there, building fortifications and a railway to Sebastopol, and laying a submarine cable to Varna. Balaklava was attacked on Oct. 25 by the Russians, who stormed four redoubts, feebly defended by Turkish troops, and captured 11 guns; but after the repulse of their cavalry by the Highlanders and their defeat by the English heavy brigade, they made no further efforts to advance. The earl of Cardigan, upon an order alleged to have been given by Lord Lucan for the capture of certain Russian guns, led the charge of his light brigade, composed only of about 600 horsemen, against the formidable array of the enemy, his men cutting their way through and back again under the play of the Russian batteries. The survivors of this brilliant but useless exploit did not exceed 150. The first who fell was Capt. Nolan, the officer who conveyed the disputed order from Lord Lucan. The English evacuated the place in June, 1856. Owing to the narrowness of the entrance, the harbor is now used only for the coasting trade with other Crimean ports. On an elevated rock, about 4 m. W. of the town, is the old monastery of St. George, with a new Greek church, and a maritime convent, the inmates of which officiate as priests for sailors. Either the monastery or a neighboring locality

Balalaika.

is supposed to be the site of the celebrated temple of Diana Taurica, of which in the legend Iphigenia was priestess.

BALALAIKA, a musical instrument with two or three strings, played with the fingers like the guitar, very popular in Russia for accompaniments, and found in almost all the cottages of the peasantry. Russian ballads have been collected, under the title of this national instrument, in French (1887) and in German (1868).

BALANCE, an instrument intended to measure different amounts or masses of matter by the determination of their weight, using as standards of comparison certain fixed units, as the gramme, the pound, the ton, &c. The instrument is founded on the law that gravitation acts in a direct ratio to the mass, and on the mechanical principle that when a solid body is suspended on one point, the centre of gravity will place itself always perpendicularly under that point. If therefore a beam, ab , fig. 1, is supported in the middle at c , and movable around this point, its centre of gravity, a , will place itself under the point c ; and if disturbed from that position, this centre will oscillate like a pendulum, and the beam will finally come to rest only with the centre of gravity in the perpendicular passing through the point of support. It is evident that when the distances from a to c and from b to c are equal, the two sides of the beam equal, and the whole made of homogeneous material, the horizontal position will be arrived at, and also when at a and b equal weights pp are suspended; the gravity of such scales and weights must be considered concentrated in the points of suspension a and b , and their common centre of gravity will be either in, under, or above the point of support, according as the line ab uniting them passes

through, under, or above the support c . But suppose we place an additional weight r in one of the scales, then the common centre of gravity of the weights in the scales will be shifted toward the side of that additional weight. Suppose it to be in d , then the centre of gravity of the whole balance will be in the line da , uniting the centre of gravity d of the

FIG. 1.

Common Balance.

weights with that of the balance a ; if then it is somewhere at m , it is evident that the balance can no longer maintain the horizontal position, but will only come to rest when m is under c , or the line cm has attained a perpendicular position. It is evident that the angle which the beam in this case makes with a horizontal line is equal to the angle scm . If the centre of gravity is in the point of support, the balance is indifferent; that is, it will, when charged with equal weights, remain at rest in any position. And if the centre of gravity is above the point of support, we have a case of so-called unstable equilibrium; the balance will with equal ease tip over to the right or left, and the beam can never be brought into the horizontal position. In either case the balance is useless, and it follows

from this that the centre of gravity must be under the point of support, and the sensitiveness of the instrument depends to a great extent on the distance between these two points. This derived degree of sensitiveness varies with the purposes for which balances are to be used. The most delicate balances are those used for physical and chemical investigation; and in order to secure the greatest possible degree of sensitiveness the conditions are as follows:

1. The centre of gravity of the beam must lie as near as possible under the point of suspension; it is evident that when this centre of gravity s is raised, the point m will be raised also, and the angle sem will become larger, which results in a greater deflection of the beam in case there is no proper equilibrium. Fine balances are provided with an upright rod above their point of suspension, on which a small weight may be screwed up or down, in order to raise or lower the centre of gravity, and so to increase or diminish the delicacy of the instrument. In fig. 1 this rod is represented below, which is only admissible when no great degree of sensitiveness is required, as in this case the centre of gravity is lowered too much.
2. The beam should be as long as compatible with strength. As the distance cd becomes greater in proportion to the length of the arms, any difference in the two weights with which the balance is charged will be the more perceptible the longer the arms are.
3. The beam should also be as light as compatible with strength; the smaller the weight of the balance itself, the greater the influence of minute differences in the load will be to shift the position of the point d from the centre. Therefore the beams of chemical balances are made like an elongated frame, with large openings between, on the same principle as the walking beams of steam engines are constructed.
4. The points of suspension of the two scales must be such that the line uniting them passes exactly through the point of support; if this line passes under that point, the sensitiveness of the balance will diminish too much when the load is increased. This takes place in any case to a small degree, as no beam is so perfectly inelastic that a slight flexion will not take place under the maximum load.
5. The distances of the points of suspension of the scales a and b from the centre c should be perfectly equal; this is best verified by changing the weights in the two scales, when if the equilibrium remains unchanged their distances are equal. Some balances have screw arrangements to correct small differences in this respect. In fig. 2 a chemical balance is represented as used, in a glass case, which serves to protect it not only from dust, but also against air currents which might prevent a truly sensitive balance from ever coming to rest, and thus make correct weighings impossible. The turning point of the beam, in order to reduce the friction to the least amount, is a knife-edge or triangular prism of hardened steel passing at right angles

through the beam, and resting when in use upon polished plates of agate (one each side of the beam), which are set exactly upon the same

FIG. 2.

Chemical Balance.

horizontal plane. This knife-edge is polished and brought to an angle of 80° . The points of suspension are also knife-edges, one set across each extremity of the beam. Great care is required that the line connecting them shall be precisely at right angles with the line passing through the centres of motion and of gravity. The index or pointer is sometimes a long needle, its line passing through the centre, and extending either above or below the beam, or it is a needle extended from each extremity of the beam. In either case it vibrates with the motion of the beam over a graduated arc, and rests upon the zero point when the beam is horizontal. The degrees upon each side of the zero of the scale indicate, as the needle oscillates past them, the intermediate point at which this will stop, thus rendering it unnecessary to wait its coming to rest. In order to save the knife-edges from wear, the beam is made, in delicate balances, to rest when not in use upon a forked arm, and the pans upon the floor of the case in which the instrument stands. The agate surfaces, being lifted by means of a cam or lever, raise the beam off its supports and put it in action; or the supports, by a similar contrivance, are let down from the beam, leaving it to rest upon the agate; the pans in the latter case must always remain suspended.—However perfectly a balance may be made, there is always great care to be exercised in its use. Errors are easily made in the estimation of the nice quantities it is used to determine. The sources of some are avoided by a simple and ingenious method of weighing suggested by Borda. The body to be weighed is exactly counterpoised, and then taken out of the pan and replaced by known weights, added till they produce the same effect. A false balance must by this method produce cor-

rect results. The weights employed for delicate balances are either troy grains, one of each of the units, one of each of the tens, and the same of the hundreds and thousands, as also of the tenths, hundredths, and thousandths of a grain; or they are the French gramme weights, with their decimal parts. The latter are the most commonly used in chemical assays and analyses. The larger weights are of brass, the smaller of platinum, and these are always handled by means of a pair of forceps. The beam of the balance is, according to the method introduced by Berzelius, frequently marked by divisional lines into tenths, and one of the small weights, as a tenth or hundredth of a grain, or a milligramme, is bent into the form of a hook, so that it may be moved along the beam to any one of these lines to bring the balance to exact equilibrium. By this arrangement the picking up and trying one weight after another is avoided, and the proportional part of the weight used is that indicated by the decimal number upon the beam at which it rests to produce equilibrium. The best materials for a balance are those which combine strength with lightness, and are least liable to be affected by the atmosphere and acid vapors. Brass, platinum, or steel is used for the beam; but probably aluminum will prove to be better adapted for this purpose than either. The pans are commonly of platinum, made very thin, and suspended by fine platinum wires. The support is a brass pillar secured to the floor of the glass case in which the instrument is kept. Doors are provided in front and at the sides, by which access is had to the instrument; but these are commonly kept closed, and are always shut in delicate weighing, that the beam shall not be disturbed by currents of air. So delicate are the best balances, that when lightly loaded and left to vibrate, they may be affected by the approach of a person to one side of the glass case, the warmth radiated from the body causing the nearest arm of the beam to be slightly expanded and elongated, so as to sensibly preponderate. The degree of sensibility is estimated by the smallest weight in proportion to the load that will cause the beam to be deflected from a horizontal line. It is said that a balance in possession of Bowdoin college, Maine, which, with a charge of 10 kilogrammes in each scale, is sensitive to $\frac{1}{10}$ of a milligramme. Becker and Sons of New York made the balance; and they make ordinary chemical balances which with one kilogramme in each scale are sensitive to one tenth of a milligramme; their small balances now in use in the assay office, New York, show a difference in load of less than $\frac{1}{100}$ part of a milligramme.—The torsion balance, invented by Coulomb to measure minute electrical forces, is still more delicate than the best beam balance. It consists of a brass wire, hung by one end and stretched by a light weight, carrying at its lower end a horizontal needle. Any force applied to one end of this needle, tending to rotate

it horizontally, will be measured by the angle through which it causes the needle to move; that is, by the torsion of the wire. (See *ELECTROMETER*.)—The steelyard, the Roman *statera*, is one of the forms of the balance, the two arms being of unequal length, the body to be weighed being suspended in a pan or otherwise from the short arm, and the counterpoise, which is a constant weight, being slid along the longer arm until equilibrium is established. As this occurs when the weight on one side multiplied by its distance from the fulcrum is equal to the weight on the other multiplied by its distance from the fulcrum, and as on one side the weight is constant, and on the other the distance from the centre of motion, the unknown weight must be determined by the distance of the constant weight from the centre.—The Danish balance differs from the common steelyard in having the counterpoise fixed at one end, and the fulcrum being slid along the graduated beam. The graduation commences at a point near the counterpoise, at which the beam with the pan suspended at the other end is in equilibrium, and the numbers increase toward the pan. A balance called the bent lever is employed to some extent for purposes not requiring extreme accuracy. The pan is attached to one end of the beam and the other carries a constant weight. From the bent form of the lever this weight is raised to a height varying with the weight placed in the scale pan. A pointer attached to the constant weight and moving along a graduated arc indicates the number at which it stops the weight of the body in the scale pan. Its indications are the least to be depended upon when the constant weight approaches to the horizontal or vertical line passing through the centre of motion. The scales generally used in the United States for weighing loaded wagons and canal boats are modifications of the steelyard, wherein the weight of these ponderous bodies is divided by means of levers, and a known fraction of it sustained by one end of a beam, the other end of which is graduated for a moving weight. Modern modifications of the steelyard contain a pan hung at the end of the arm to receive large weights, while the sliding weight is used only to balance the fractional parts.—Spring balances are popular instruments, and consist of a helix of wire enclosed in a cylinder. The body to be weighed is suspended to a wire passing through the centre of the helix and fastened to the upper coil, which carries a pointer down a narrow slit in the cylinder, thus indicating the weight on the graduated sides of the cylinder.

BALANGUINI, or *Banginas*, an islet of the Malay archipelago, in the Sulu group, claimed by Spain as part of the province of Zamboanga, in the Philippine island of Mindanao, in lat. 8° 57' 30" N., lon. 121° 39' E. It is about 8 m. long and 1 broad, and gives its name to the most daring Malay pirates. In 1848 it was captured by the Spaniards, who had 11 officers and 170 men killed and wounded; 450 of the

pirates were killed, refusing to take quarter. The forts and houses of the island were levelled to the ground, and to make it uninhabitable about 8,000 cocoa palms were cut down.

BALARD, Antoine Jérôme, a French chemist, born in Montpellier, Sept. 30, 1802. He was an apothecary and subsequently professor of pharmacy and chemistry, and acquired celebrity in 1826 by the discovery of bromine in sea water, also by the extraction of sulphate of soda, which increased the supply and lowered the price of potash. He has written on these discoveries and on other subjects in the *Annales de chimie et de physique*, and in the *Mémoires* of the academy. He succeeded Thénard in the chair of chemistry in the faculty of sciences of Paris, and Pelouze in the collège de France in 1851. He became a member of the academy in 1844. In 1868 he was appointed inspector general of superior instruction and honorary professor at the faculty of sciences.

BALARUC, a French watering place, in the department of Hérault, 15 m. S. W. of Montpellier; pop. 600. The springs were known to the Romans, who formed aqueducts and built a temple here. They have a temperature of about 129° F. in summer and 115° in winter, and are recommended for paralysis. A public hospital gives gratuitous relief to the destitute and to soldiers.

BALASORE, a city in the presidency of Bengal and province of Orissa, India, the principal seaport of Outtack, 120 m. S. W. of Calcutta; pop. about 11,000. It formerly had factories of almost all European nations, but has much declined, the principal trade being limited to imports of the products of the cocoanut and of coir, cowries, tortoise shell, and salted fish from the Maldive islands, in exchange for rice, sugar, and English manufactured goods and hardware. It is provided with dry docks for the accommodation of small vessels at spring tides. Denmark ceded the town to England in 1844.

BALASSA-GYARMATH, a town of Hungary, capital of the county of Nógrád, situated in a delightful region on the Eipel, 42 m. N. of Pesth; pop. in 1870, 6,435. It has an old mountain castle, and carries on considerable trade in oil and wine. In 1626 a peace was concluded here between Austria and Turkey.

BALATON, Lake (Ger. *Plattensee*), a large lake in S. W. Hungary, in the counties of Zala, Veszprém, and Somogy; length, from S. W. to N. E., about 47 m.; greatest breadth 9 m.; depth from 27 to 86 feet; area, about 450 sq. m. It is fed by the river Szala, and discharges its waters through the Sió, which falls into the Sárviz, an affluent of the Danube. The lake abounds in fish. The fogas, a kind of large perch, is found only in this lake; it frequently weighs 10 to 15 and sometimes 20 pounds. There is also a species of white fish resembling the herring, which appears in large shoals during the winter. Crabs, crayfish, tortoises, and mussels are found. Iron sand occurs on the shores, which exhibits under the mi-

croscope grains of garnet, ruby, topaz, amethyst, and other precious stones.

BALBI, Adriano, an Italian geographer, born in Venice, April 25, 1782, died there, March 14, 1848. After holding a professorship of geography, sciences, and statistics in Italy, he spent many years in Portugal while preparing several works relating to that country. He subsequently resided in Paris, receiving assistance from the French government, in 1832 went to Padua, and finally to Vienna, where the Austrian government gave him a pension. His principal works are: *Atlas ethnographique du globe* (Paris, 1826), a work of superior arrangement, containing the latest researches of German philologists, and *Abrégé de géographie* (2 vols., 1832), a summary of geographical science, which has been translated into nearly all the European languages (English translation, "Abridgment of Geography," New York, 1835). With La Renaudière and Huot he used to some extent unpublished writings of Malte-Brun in preparing a *Traité élémentaire de géographie* (2 vols., 1830-'31). Among his other publications are: *La monarchie française comparée aux principaux états de l'Europe* (Paris, 1828); *Balance politique du globe* (1828); *L'Empire russe comparée aux principaux états du monde* (1829); "The World compared with the British Empire" (1830). His son, the geographer EUGENIO BALBI, has edited a collection of his *Scritti geografici* (5 vols., Turin, 1841-'2).

BALBI, Giovanni de Janua or *Jannensis* (from his birthplace, Genoa), a Dominican friar of the 18th century, author of a universal cyclopædia or *Catholicon* (about 1286), which owes its celebrity principally to the fact that it became one of the earliest monuments of the art of printing. The original edition, *Summa Grammaticalis valde Notabilis quæ Catholicon nominatur*, was printed at Mentz by Faust and Schöffer in 1460, and was reprinted at Augsburg in 1469 and 1472, at Nuremberg in 1483, at Venice in 1487, and at Lyons in 1520.

BALBI, Countess de, a favorite of the count de Provence, afterward Louis XVIII., born in 1753, died in Paris about 1836. She was the daughter of the marquis de Caumont de la Force, and was lady in waiting to the countess de Provence, and the wife of the Genoese count de Balbi, who became insane in consequence of her misconduct. The count de Provence continued to lavish vast amounts upon her even after the smallpox had destroyed her beauty. After the outbreak of the revolution she persuaded him to leave France, but he subsequently discarded her, and she was expelled from many capitals on account of her dissipation and intrigues. On her return to France she was exiled to Montauban, where she established a gambling house. She died in obscurity.

BALBINUS, Decimus Cælius, a Roman emperor, slain in A. D. 238. He was a senator, and twice consul, and was elected emperor by the senate in conjunction with Maximus, in opposition to

Maximin—a third emperor, the young Gordianus, being adjoined to them by the clamors of the people and the soldiery. Maximin being killed by his own mutinous soldiers at the siege of Aquileia, Maximus was triumphantly received in Rome; but soon falling out with Balbinus, he depended only for his support upon a body of Germanic barbarians against the praetorians, who disliked both emperors. While the citizens were witnessing the Capitoline games, the two rulers were put to death by the praetorians, who proclaimed the boy Gordianus the emperor.

BALBO, Cesare, count, an Italian statesman and author, born in Turin, Nov. 21, 1789, died here, June 9, 1858. Through the favor of Napoleon, he was appointed auditor to the French rivy council in 1807, afterward secretary to the French commissioners in Tuscany and the Papal States, and in 1812 commissioner of Iliria. After the downfall of Napoleon he was secretary of legation in London until the outbreak of the Sardinian revolution in 1821, when he returned to Turin. He translated Leo's work on the municipal institutions of Lombardy from German into Italian, under the title of *Comuni Italiani*. His reputation was firmly established by his *Speranze d'Italia* (1843), in favor of national independence. His *Bella storia d'Italia, dall'origine fino al 1814* (5th edition, Bastia, 1849) was distinguished by the same patriotic spirit and by historical merit. In 1848 he formed the first constitutional cabinet of Charles Albert, which, however, lasted but a few months, and after the Sardinian reverses in the field he exerted great influence as a leader of the moderate party and supporter of D'Azeglio. His biography was published by Ricotti (Florence, 1856), and a monument by Vela has been erected in his honor in Turin.

BALBOA, Vasco Núñez de, a Spanish American discoverer, born at Xeres de los Caballeros, Extremadura, in 1475, beheaded at Castilla de Oro, Darien, in 1517. He was a nobleman who escaped from his creditors to Hispaniola, and subsequently joined Enciso's Darien expedition. Quarrels between rival commanders made him chief of the new settlement. His humane policy reconciled the Indians, and while engaged in exploring the isthmus he reached the summit of a mountain from which he discovered the Pacific, Sept. 26, 1513. He erected a cross on the spot, and took possession of the whole region for Spain. But before the news of this important discovery reached Madrid Enciso's intrigues had resulted in Balboa's displacement by Davila, who soon lost the advantages gained by his predecessor. The Spanish government, at length enlightened in regard to the great achievements of Balboa, named him deputy governor; but Davila opposing his installation, he went in search of new settlements. Thisasperated Davila still more, but his wrath was for a time appeased by the intercession of influential personages, and he even gave his

daughter in marriage to Balboa. The continued success of the latter, however, revived his jealousy, and he seized a pretext for charging him with treason, and subjecting him to a mock trial. Balboa and four of his friends were executed, he protesting to the last his innocence and his loyalty.

BALBRIGGAN, a town of Ireland in the county of Wick, 18 m. N. N. E. of Dublin; pop. about 2,500. It is the seat of thriving manufacture of cotton goods and hosiery. The cotton stockings made here are remarkable for the fineness of their texture; many females are also employed in embroidering muslins. In 1780 Baron Hamilton, with the help of the Irish parliament, established cotton works here, and built a pier, to which an inner dock was afterward added by a member of the same family. The railroad crosses the harbor by a viaduct of 11 arches of 30 ft. span. Balbriggan is a favorite watering place.

BALBUENA, Bernardo de, a Spanish poet and prelate, born at Val de Peñas in 1568, died in Porto Rico in 1627. He was educated in Mexico, became provost in Jamaica, and in 1620 bishop of Porto Rico. He wrote *El siglo de oro* ("The Age of Gold"), a pastoral romance the scene of which is laid in the new world. *La grandesa Mexicana* (new edition, 1821); and *El Bernardo* (8 vols., Madrid, 1624; new ed., 2 vols. 8vo, 1808), an epic which is among his most finished productions.

BALBUS. I. *Lucius Cornelius* (Major), a Roman consul, born in Gades (Cadix) in the 1st century B. C. He served in the Sertorian war, after which Roman citizenship was conferred on his family. Shortly afterward he removed to Rome. He accompanied Cæsar into Spain in 61, and into Gaul in 58, and was appointed *prefectus fabrum* to his legions. During the Gallic wars he spent much time at Rome, where he managed Cæsar's private property, and acted as agent for the sale of spoils taken from the enemy. In 56 his foes and those of the triumvirs charged him with having assumed illegally the privileges of a Roman citizen; but he won the trial, owing to his defence by Pompey, Crassus, and especially by Cicero. Balbus did not bear arms against the Pompeians in the civil wars, but remained at Rome working in the interest of Cæsar, and finally succeeding in gaining Cicero for the dictator's cause. On the assassination of Cæsar Balbus retired to his country seat, where he remained until the arrival of Octavius in Italy. He then hastened to Naples to meet the latter, whom he accompanied to Rome, and who appointed him *medile*, *prætor*, and in 40 consul, he being supposed to have been the first adopted citizen who filled that office. In his will he bequeathed 20 denarii to every Roman citizen. He wrote a diary of the most eventful occurrences in his own and Cæsar's life, and provided for the continuation of the "Commentaries on the Gallic War." Four of his letters to Cicero are extant. II. *Lucius Cornelius*

(Minor), a nephew of the preceding, born in Gades. After the outbreak of the civil war he made ineffectual attempts to detach the consul L. Cornelius Lentulus, an intimate friend of his family, from his allegiance to Pompey. Balbus attended Cæsar throughout all the campaigns of this period, and after their termination was appointed pontiff. While quæstor to Asinius Pollio in Further Spain in 44 and 43 B. C. he greatly enlarged and improved his native city. But his quæstorship was marked by fraud and oppression, and he ultimately fled to Africa (43), and 20 years afterward reappeared as proconsul of Africa. While holding this office he gained a victory over the Garamantes, which procured him the honor of a triumph in Rome, the first ever enjoyed by an adopted citizen. Balbus, like his uncle, amassed a large fortune. He built a theatre at Rome, and was a favorite of Augustus. **III. Quintus Lucilius**, a Roman philosopher, of the earlier half of the 1st century B. C., whom Cicero compared to the best Greek philosophers, and made the expositor of stoical opinions in his dialogue *De Natura Deorum*. **IV. Lucius Octavius**, a Roman jurist, probably brother of the preceding, and one of those who were executed by order of the triumvirs Octavius, Antony, and Lepidus. **V. Titus Ampius**, a Roman tribune, who in 63 B. C. sought to obtain for Pompey the honor of wearing a laurel crown and all the insignia of a triumph at the Circensian and other games, in consideration of his Asiatic victories. He was next an unsuccessful candidate for the ædileship, though sustained by Pompey. In 59 he was prætor, and in 58 governor of Cilicia. On the outbreak of the civil war he joined the Pompeians. After the overthrow of his party at Pharsalia he was banished, but the mediation of Cicero put an end to his exile. He wrote a work on contemporary events, an extract of which is given in Suetonius.

BALDE, Jakob, a German Latin poet, born at Ensheim, Alsace, in 1603, died at Neuburg, in the Palatinate, Aug. 9, 1668. He was a professor of literature, joined the society of Jesus, and became chaplain of the elector of Bavaria. His complete works, including lyrical and other Latin poems, were published in Munich in 8 vols., 1729. He has been called the German Horace, and Herder translated several of his compositions. New editions of his *Carmina Lyrica* and *Batrachomyomachia* appeared at Münster in 1856-'9, the latter with a German version.

BALDI, Bernardino, an Italian scholar, born in Urbino, June 6, 1553, died there, Oct. 12, 1617. He was a fellow student with Tasso, and became an intimate friend of St. Charles Borromeo, and was in possession of the rich abbey of Guastalla from 1586 to 1611. He was familiar with 16 languages, and the author of about 100 miscellaneous works on mathematics, geography, history, &c., and commentaries and translations. His sonnets and his didactic

poem in blank verse, *La Nautica* (1590; French version in prose, Paris, 1840), are among the finest productions of his day. He prepared a translation of the Chaldaic Targum of Onkelos, Arabic and Persian grammars, and Turkish, Hungarian, and Arabic dictionaries.

BALDUR, or **Balder**, in northern mythology, the son of Odin and Frigga, and the most beautiful and beloved of the gods of Odin's race. He was the husband of Nanna and the father of Forseti. His home was in Breidablik, the most beautiful part of Asgard, the northern Olympus. Baldur having long been troubled by dreams and evil omens, indicating danger to his life, his mother travelled through the whole universe, eliciting from every created thing a promise not to injure the god. She only neglected to ask this from the mistletoe, which seemed to her entirely harmless. Loki, the most deceitful among the gods, and an enemy of Baldur, remarked this omission, and cut from the mistletoe a piece for the point of a dart. The other gods, surrounding Baldur, made proof of his invulnerability, in sport, by casting at him their weapons, with stones and clubs of wood; but nothing injured him. Then Loki approached and induced the blind god Hodur to throw the dart he had made from the forgotten mistletoe. Baldur was pierced by it and killed. The gods, lamenting his loss, sent his brother Hermodur to Hel, the under world, to ask upon what condition the goddess of the dead would release him. The reply was that he could only be spared if everything in the world would weep for him. All consented except Loki, who had disguised himself as a giantess. The gods then celebrated Baldur's funeral with the greatest pomp. His body was carried to the seashore and burned on his great ship Hinghorni, which was lifted out of the sea by the aid of the giantess Hrokin. Nanna died of grief, and her body was burned with his. By the ancient Germans Baldur was worshipped as the god of peace; other northern nations seem also to have imagined him as a deity similar to the Greek Apollo.

BALDWIN. **I.** A central county of Georgia, bounded N. by Little river, and intersected by the Oconee; area, 257 sq. m.; pop. in 1870, 10,618, of whom 6,774 were colored. The surface is diversified. The river bottoms are highly fertile, but much of the land in other places is nearly worn out. The Milledgeville branch of the Georgia Central railroad and the Macon and Augusta railroad pass through the county. The chief productions in 1870 were 3,553 bushels of wheat, 89,857 of Indian corn, 18,285 of sweet potatoes, and 4,036 bales of cotton. Capital, Milledgeville. **II.** A S. county of Alabama, separated on the E. from Florida by the Perdido river and bay, bounded S. by the gulf of Mexico and W. by Mobile bay and the Mobile and Alabama rivers, and intersected by the Tensaw river; area, about 1,500 sq. m.; pop. in 1870, 8,004, of whom 2,845 were colored. The Mobile and Montgomery railroad passes through

the county. The surface is level or moderately uneven. The soil is sandy and unproductive, but supports a valuable growth of pine timber. The chief productions in 1870 were 31,025 bushels of Indian corn, 19,411 of sweet potatoes, 87 bales of cotton, and 9,864 lbs. of wool. Capital, Blakely.

BALDWIN (Fr. *Baudouin* or *Balduin*), the name of several counts of Flanders.—**Baldwin I.**, surnamed Iron-Arm, was a son-in-law of Charles the Bald, king of France, and died in 879.—**Baldwin II.**, the Bald, son of the preceding, died in 918. He waged war against the kings of France, Eudes and Charles the Simple.—**Baldwin IV.**, the Bearded, died in 1030. He increased his family domain by several conquests, especially that of Valenciennes, and received from the emperor Henry II. the island of Walcheren.—**Baldwin V.**, of Lille, the Débonnaire, son of the preceding and son-in-law of King Robert of France, died in 1067. He conquered Hainault, was regent of France during the minority of his nephew Philip I., and helped William of Normandy, his son-in-law, in the conquest of England.—**Baldwin VIII.** died in 1195. He was an enemy of Philip Augustus, but became reconciled and swore allegiance to him in 1192.—**Baldwin IX.**, son of the preceding. See **BALDWIN I.** of Constantinople.

BALDWIN, the name of two emperors of Constantinople.—**Baldwin I.** (the ninth Flemish count of that name), born in Valenciennes in 1171, died in 1205 or 1206. He brought to a close a war with Philip Augustus, appointed his uncle William, his brother Philip, and Bouchard d'Avannes regents of Flanders, took holy orders in Brussels in 1200 or 1201, and joined the crusaders, together with his brother Thierry. Subsequently he cooperated with the Venetians under Dandolo, and with the connivance of Alexia, son of the deposed Byzantine emperor Isaac, in the capture of Constantinople, when he was crowned as emperor, May 16, 1204. His power was only nominal, the crusaders dividing the Byzantine provinces among their other leaders. Baldwin delivered Thrace from the Turkish invaders, but the Greeks having invoked the assistance of the Bulgarians against him, he was captured April 14, 1205, near Adrianople, and subjected to tortures from which he died. Some accounts, however, leave it doubtful whether he fell in battle or died in prison.—**Baldwin II.**, last Latin emperor of Constantinople, born in 1217, died in 1273. He was a son of Peter de Courtenay, succeeded his brother Robert in 1228, and, though aided by the pope and King Louis IX., was finally driven from Constantinople by Michael Palæologus, who gained possession of the city by stratagem in July, 1261. Baldwin fled in disguise to the island of Negropont, and from thence to Italy, where he died in obscurity.

BALDWIN, the name of five kings of Jerusalem.—**Baldwin I.**, born in 1058, died in 1118. He was a descendant of the fifth count of Flanders, and joined his brother Godfrey de Bouil-

lon in the first crusade. He quarrelled with Tancred and other crusaders, retired to Edessa, where he was elected count, and in 1100, after the death of Godfrey, was chosen to the throne of Jerusalem. In 1102, after commanding in the disastrous battle of Rama, he was besieged in Jaffa by the Saracens, but put them to flight. The next year he was repulsed before St. Jean d'Acre (Ptolemais), but he captured it with the aid of the Genoese in 1104, after a 90 days' siege. In 1109 he took Berytus (Beirut) after a siege of 75 days, and in 1110 Sidon (Saida). He fell ill during an expedition to Egypt and died on his homeward journey to Jerusalem. His intestines were buried in a place which is called the sepulchre of Baldwin, and the rest of his remains were interred in Jerusalem by the side of his brother.—**Baldwin II.**, surnamed Le Bournois, died Aug. 21, 1181. He was the son of Hugh, count of Rethel, and a cousin of the preceding, whom he succeeded as ruler of Edessa in 1100. In 1118 he was crowned king of Jerusalem, and in 1119 relieved Antioch from the Molesims. In February, 1124, while attempting to rescue Jocelin, count of Edessa, and Galeran, his relative, he was captured and ransomed in August together with Jocelin, Tyre having been conquered during his absence by the regent Eustache Garnier. After his return to Jerusalem Baldwin made an ineffectual attempt to take Aleppo, but he succeeded in other military exploits, and considerably extended the boundaries of his kingdom. The order of the templars was sanctioned by the Roman see under his reign. He was one of the bravest knights of his day, and remarkable both for his valor and his piety. He was succeeded by his son-in-law Fulk of Anjou.—**Baldwin III.**, grandson of the preceding, born about 1180, died Feb. 23, 1162. He succeeded his father Fulk in 1143, under the guardianship of his mother Melisanda. In 1148 he joined the emperor Conrad and Louis VII. of France in the siege of Damascus. After the failure of this enterprise, he restored and fortified the ancient town of Gaza; and in 1153 he captured Ascalon after a siege of seven months, and made his brother Amaury its ruler. In 1159 he took Caesarea, which he gave to Renaud, prince of Antioch. He secured the alliance of the Greek emperor Manuel by marrying his daughter Theodora, but died childless and was succeeded by his brother Amaury. He was regarded as a model knight.—**Baldwin IV.**, nephew of the preceding, born in 1164, succeeded his father Amaury in 1173, died March 11, 1186. It was in his reign that Saladin assumed the title of sultan, and began his warfare with the Franks of Palestine, narrowing the capture of Baldwin near Sidon in 1178, but being defeated in 1182 near Tiberias. Attacked with leprosy in 1183, Baldwin caused his nephew, the son of his sister Sibyl by her first marriage with Count William of Montfermat, to be crowned as Baldwin V., and at the same time chose Guy de Lusignan as second

husband of his sister and regent during Baldwin's minority. Guy, however, was soon displaced at the demand of the barons, and retired to Ascalon, where he defied a weak effort of Baldwin to bring him to trial. Baldwin IV. died while an embassy from his court was on the way to Europe to invoke assistance against Saladin. Baldwin V. was supposed to have been poisoned by his mother (1186) in order to secure the crown for Lusignan, who accordingly succeeded.

BALDWIN, John Dennison, an American journalist and archaeologist, born at North Stonington, Conn., Sept. 28, 1809. At the age of 14 he was thrown entirely upon his own exertions. He fitted himself in the common school and at an academy to enter college. Not being able to pursue a collegiate course, he began the study of law, but soon abandoned it for theology, and while pursuing his theological studies at the divinity school in New Haven went through the course pursued by the freshman, sophomore, and junior classes in Yale college, from which he received the honorary degree of A. M. In 1833 he was licensed to preach, and was settled at North Branford, Conn., where he remained seven or eight years. He acquired the French and German languages, and by 1844 had begun to give special attention to archaeology and its bearing upon the current schemes of ancient history. He also wrote much for magazines and newspapers, and became editor of the "Charter Oak," an anti-slavery newspaper published in Hartford, and afterward of the "Commonwealth," published in Boston. In 1859 he became editor and proprietor of the "Worcester Spy," one of the oldest journals in New England. In 1863 he was elected to congress, and was twice reelected. In 1847 he published "Raymond Hill," a small volume of poems. While a member of congress he continued his archaeological studies, and in 1869 published a work on "Prehistoric Nations," and in 1872 one on "Ancient America."

BALEARIC ISLANDS, a group of islands in the Mediterranean, the principal of which are Majorca, Minorca, and the penal settlement of Cabrera, forming a province of Spain, situated opposite that of Valencia, between lat. 39° 6' and 40° 5' N. and lon. 2° 20' and 4° 21' E.; area, 1,860 sq. m.; pop. in 1867, 284,398. Formerly the islands of Iviza and Formentera, lying between Majorca and the mainland, were generally considered a part of this group. Both Majorca and Minorca are mountainous, the highest mountain rising over 5,000 feet above the sea. The climate is delightful, and the soil extremely fertile, but agriculture and cattle-breeding are neglected, despite of fine pasture. Sheep and hogs are very large, however, and mules and asses are reared for exportation. The principal products are olives, oranges, figs, and other fruits, red and white wine, and saffron. The exports comprise these articles as well as oil, brandy, home-made palm brooms, baskets, and wooden wares. The

trade is chiefly carried on in Majorca and Minorca. The inhabitants resemble the Catalans. The language of the common people is a corrupt Catalan dialect mixed with words from various eastern languages. The islands were known to the Greeks and Romans under their present name, which they derived from *βάλλειν*, to throw, in reference to the great skill of the inhabitants as slingers. Early settlements were made by the Phœnicians and Carthaginians. During the Punic wars the islanders served as slingers in the armies of both Carthage and Rome. Subsequently their piracies caused them to be subdued by the Romans under Q. C. Metellus (123 B. C.), hence surnamed *Balearius*. They successively fell into the hands of the Vandals, the Visigoths, and the Moors; were held by Charlemagne six years, and retaken by the Moors, who were not expelled till the 13th century. Conquered by James I. of Aragon in 1229, they formed after his death, for about 70 years, a part of the kingdom of Majorca, and in 1343 reverted to Aragon.

BALECHON, Jean Jacques Nicolas, a French engraver, born at Arles in 1715, died in Avignon, Aug. 18, 1765. His finest work is the full-length portrait of Augustus III., king of Poland, after Rigaud, in the Dresden gallery. Among his works were three fine plates after Claude Vernet, and one of Ste. Geneviève, after Vanloo.

BALEN, Hendrik van, a Flemish painter, born in Antwerp in 1560, died there in 1632. He was a pupil of Adam von Oort, the teacher of Rubens, perfected his art in Italy, and became the instructor of Vandyke and Snyders, and the first of Flemish painters who succeeded in purity of coloring. His cabinet pictures, chiefly classical subjects, with landscapes by Jan Breughel and Kieringa, enjoyed great popularity. Altar pieces of his are in the Antwerp cathedral.

BALESTRA, Antonio, an Italian painter, born in Verona in 1666, died April 2, 1740, or according to some accounts in 1734 or 1744. He left commerce for art, studied in Venice, Bologna, Rome, and Naples, and became a member of the academy of St. Luke in Rome, which conferred a prize upon his "Defeat of the Giants." In 1695 he removed to Venice, and afterward to Verona. He was one of the last great representatives of the Venetian school. He engraved in aquatint, and must not be confounded with the copperplate engraver Giovanni Balestra.

BALFE, Michael William, an Irish composer, born in Dublin, May 15, 1808, died in London, Oct. 20, 1870. When eight years old he played a concerto on the violin at a public concert. At the age of nine he wrote the ballad called "The Lover's Mistake," effectively introduced into the play of "Paul Pry" by Mme. Vestris. He lost his father in 1823, and went to London with Mr. Charles Horn, the composer, as an articulated pupil for seven years. He was soon engaged as principal violinist at the Drury

Lane oratorios, and in the Drury Lane orchestra, under Thomas Cooke. In 1825 he went on the stage. His voice, which he had cultivated, was a rich baritone, but he utterly failed from timidity as Casper in *Der Freischütz*, at the Norwich theatre. Immediately afterward Count Mazzara, who fancied that he resembled a son whom his wife had lost, took young Balfe with him to Rome, where the countess received him very tenderly. Here he remained for a year, studying under the best masters. After this, still through the bounty of Count Mazzara, he had similar advantages at Milan, where his first production of any pretension, a ballet called *Le Peyrouse*, was performed with great success. Passing on to Paris, where Rossini held out hopes of an engagement at the Italian opera, he applied himself to study for several months, and at last appeared as Figaro in the "Barber of Seville," with Sontag as Rosina. His career as a dramatic singer was triumphant, in Italy as well as in France, after this. He sang in New York in 1834, and in 1835 returned to London, accompanied by his wife, who had been Mlle. Lina Réser, prima donna of the troupe in Sicily. He sang at the ancient and philharmonic concerts in London, and appeared at Drury Lane in his "Siege of Rochelle," "The Jewess," and *Chère de Rosenberg*. The "Maid of Artois," written for Mme. Malibran, and in which she won one of her greatest triumphs, came next. A variety of operas, among which "Falstaff" deserves particular mention, followed, and most of them were popular. In 1839 Mr. Balfe became manager of the English opera house, but did not succeed. His "Bohemian Girl," the most popular and one of the best of all his works, filled the treasury at Drury Lane, and is still a favorite in England and the United States. Toward the close of Mr. Balfe's life it was successfully produced in Paris under the composer's direction. "The Daughter of St. Mark," "The Enchantress," "The Bondman," "The Rose of Castile," "The Puritan's Daughter," "Satanella" (1858), and other operas were subsequently produced, and many of them were represented with great success in Germany.—In the spring of 1857 his daughter, Miss VICTORIA BALFE, appeared on the stage in London as a vocalist. In 1860 she married Sir John Crampton, from whom she was divorced in 1863; and in 1864 she married the Spanish duke de Frias. She died in Madrid, Jan. 21, 1871.

BALFOUR, Alexander, a Scottish author, born in the parish of Monikee, Forfarshire, March 1, 1767, died Sept. 18, 1829. He was apprenticed to a weaver, failed in business in London (1815), and eventually became a clerk of the Messrs. Blackwood in Edinburgh. Mr. Canning obtained for him a grant of £100 from the national treasury. He wrote "Campbell, or the Scottish Probationer" (1819); "The Foundling of Glenthorn, or the Smuggler's Cave" (1823); and "Highland Mary." He edited the poems of his friend Richard Gall, and contrib-

uted to the "Edinburgh Review." D. Moir published a posthumous selection of his writings under the title of "Weeds and Wild Flowers," with a biographical notice.

BALFOUR, Sir James, a Scottish jurist and politician, born in Fifeshire early in the 17th century, died about 1883. He was educated for the Roman Catholic church, but joined Protestants, took part in the conspiracy against Cardinal Beaton, was made prisoner at the surrender of the castle of St. Andrews, and with Knox, who called him the blasphemer Balfour, was imprisoned in the French galley. He escaped in 1550, again changed his religion, attached himself to Bothwell's fortunes, was made privy councillor, and received many other appointments, including the governorship of Edinburgh castle. He was present at the murder of Rizzio, and accused of complicity in the death of Darnley. He gave up the confederate lords the celebrated letters entrusted to him for safe keeping by Bothwell on which it was attempted to establish Mary's guilt. Murray afterward made him president of the court of session, and Morton employed him with Skene in compiling the revision of the Scottish statutes, known as "The Practicks." One of his last acts was compassing Morton's death by furnishing the deed signed by him at the time of the assassination of Darnley.

BALFOUR, Walter, an American clergyman, born in the parish of St. Niniana, Stirlingshire, Scotland, about 1776, died in Charleston, S. C., Jan. 3, 1852. He was educated for the ministry of the church of Scotland, and after preaching a few years emigrated to America. He was still in the faith of the Scottish kirks but at the age of 30 became a Baptist. A few years later some circumstances, among which he always reckoned the letters of Prof. Stuart of Andover to the Rev. W. E. Channing, written in 1819, led him to think of the doctrines of Universalism, and finally to embrace them. In 1823 he avowed his opinions, and was from that time a laborious writer and preacher in support of the doctrines he then espoused.

BALFORTH, or Balfurath, a town of Persia, in the province of Mazanderan, situated on the river Bahbul, here crossed by a bridge of arches, about 12 m. from the southern shore of the Caspian sea, and about 100 m. N. E. of Teheran; pop. about 50,000. It is situated in a swampy but fertile country, in the midst of tall trees. It formerly had an extensive trade with Russia, and many fine bazaars and colleges, but has much declined owing to the ravages of the plague and the cholera, and to its unhealthy climate.

BALI, or Little Java, an island of the Malay archipelago, the westernmost of the Little Sunda islands, situated between Java and Lombok, 100 m. long by 35 m. average breadth; area about 2,200 sq. m.; pop. about 600,000. The geography resembles that of Java, from which it is separated by a narrow strait. The island is traversed E. and W. by mountain ranges, which

terminate in a volcanic peak over 11,000 ft. high. The eruption in 1815 of another volcano, Gunung Batur, 7,000 ft. high, caused great loss of life. The coast is rugged, and has few harbors. The land is productive, and abundantly watered. The chief products in the south are grain and sweet potatoes, and in the north rice. The imports are opium, betel, ivory, gold, and silver; and the exports include hides, oil, edible birds' nests, and other articles. The natives are skilful artificers in gold and iron, and manufacture firearms. They are supposed to be descended from Hindoo colonists of Java, and are with those of Lombok the only people in the archipelago who observe Hindoo rites. The Kavi is the religious language, and the Sunda is spoken by the masses. Widows are killed by their nearest relatives, and their bodies burned. Among the nobles the practice of burning the dead also prevails to some extent. Many of the higher classes are fond of letters, and have large collections of MSS., chiefly translations from Javanese and Malay. There are in the island about 4,000 Mohammedans and 8,000 Chinese. The island was divided in 1815 into nine principalities or rajahships, the village administration being about the same as in Java. The prince of Klongkong has a theocratic supremacy over all the islands by virtue of his reputed descent from Deva Agung, the deified progenitor of the Balinese. The most powerful of all the principalities is Karang Assam, in the north-east, which is dynastically united with the neighboring island of Lombok. The Dutch in 1846 resented an alleged insult to one of their diplomatic agents by capturing the chief fortress, Balling, and extorting a treaty, the violation of which led to a new expedition in 1847, in which they were defeated with considerable loss. Subsequent expeditions were more successful, both in checking the Bali pirates and inducing the ruling princes to make important concessions. The Dutch have a settlement at Badong on the S. coast.

BALIOL. See BALLIOL.

BALIZE, or **Belize**, a town of British Honduras, Central America, at the mouth of the river of the same name, in lat. 17° 29' N., lon. 88° 8' W.; pop. about 12,000, many of whom are negroes. It is built along a single street running parallel with the seashore; from this extend only a few inconsiderable side streets, almost every house in the town facing the main thoroughfare. The principal buildings are the market (an iron structure), the government savings bank, a hospital and an insane asylum, and several churches. There are also numerous schools. The trade of Balize is considerable; cochineal and mahogany are the leading articles of export. Balize was first settled by the English about 1670; and after numerous contests with the Spaniards, who claimed possession of the site, it was finally confirmed to the British by the treaty of 1783. It is the seat of the legislature of British Honduras.

BALKAN MOUNTAINS, an extensive range bounding the great plains of Bulgaria S. of the lower Danube. The true Balkan, or ancient Hæmus, commences on the Black sea at Cape Emineh or Hæmus, lat. 42° 48', and, after making a curve to the north, runs W. S. W. to the sources of the Maritza, the ancient Hebrus, comprising about four degrees of longitude, dividing Bulgaria from Roumelia or Thrace. Here it is intersected at an acute angle by a range running N. W. and S. E. from Roumelia into Servia, and called by the ancients Rhodope and Scymnus, by moderns Despoto Dagh and Dupansha Dagh. Further west, after making a sharp curve toward the southern frontier of Servia, it becomes the Mount Orbelus of the ancients. Between Servia and Albania it is the Mons Scardus, or Kara Dagh, and thence crosses Albania, joining the Dinaric Alps and approaching the Adriatic sea. The offshoots of the Balkan both N. and S. are very numerous, extending toward the Carpathians on one side, and the mountains of Macedonia on the other. The average elevation of these mountains is about 4,000 ft. The loftiest peaks rise about 4,000 ft. higher. The Balkan is the natural northern defence of Turkey. It has a number of passes, the principal of which is that of Shumla, by which the Russians under General Diebitsch effected a passage in 1829. Some of the rivers which take their rise in the Balkan are of considerable importance. Those which flow from the northern watershed are tributaries to the Danube, with the exception of a few which run into the Black sea. On the south the Maritza and its tributaries flow into the Ægean sea. From the western range the Morava (Margus) and the Drina (Drinus) flow north through Servia from Mount Orbelus. On the south the Mesta or Kara Su (Nestus), Struma (Strymon), and Vardar (Axius) carry off the waters into the gulfs of Contessa and Salonica. The mountains are principally of granitic formation. Marble is abundant in the southern ranges. Gold and silver were found by the ancients. Copper, iron, and lead mines also exist.

BALKASH, *Balkhash*, or *Tengiz*, a lake of S. W. Siberia, between lat. 44° and 47° N., and lon. 74° and 79° E.; length from N. E. to S. W., 250 m.; greatest breadth, 70 m.; area about 8,000 sq. m. It has no visible outlet. It is enclosed by mountains on the E. and W. On the S. and S. W. it receives the Ili, whose valley was a century ago the principal domain of the Dzungaris. They were nearly annihilated by the Chinese, who introduced various settlers for the cultivation of the soil. The lake is frozen during winter. It contains only small fish. The Russian government has attempted to navigate part of the Ili since 1852.

BALKH. I. A country of central Asia, the main part of ancient Bactria, situated between lat. 35° and 37° N., and lon. 63° and 69° E., bounded N. by the Oxus, E. by Badakhshan, W. by the desert, and S. by the Hindoo Koosh

and its western continuation; area, nearly 30,000 sq. m.; pop. about 1,000,000, chiefly Uzbecks. The southern part is rocky, but has many fine valleys; the eastern is mountainous, but less barren than the western and northern parts. Its inhabitants comprise both peaceful and warlike tribes. Many are engaged in the caravan trade between Russia, China, and India; others are mechanics and agriculturists. Balkh formerly included Koondooz, Khooloom, and other districts which have now become separate governments. It formed part of Cabool, and after the fall of the Durrani dynasty came into the hands of the ruler of Bokhara. In 1850 it was conquered by Dost Mohammed, and the widow of Feis Mohammed of Balkh furnished in 1867 funds to Shere Ali for gathering a considerable army. In 1871 a treaty was concluded which fixed the upper Oxus as a boundary line between Afghanistan and Bokhara, Balkh belonging again to the latter government, though in an unsettled condition and virtually ruled by Russian influence. II. A city (anc. *Bactra*), capital of the preceding country, in lat. 36° 48' N., lon. 67° 18' E., on the Balkh or Dehaz river, a tributary of the Oxus, 250 m. S. E. of Bokhara and 180 m. N. W. of Cabool; pop. about 2,000. Its origin is associated with Kaimurs, the mythical founder of a Persian dynasty, and it flourished as the capital of a Greek kingdom under the successors of Alexander the Great. (See *BACTRIA*.) Devastated by Genghis Khan, Tamerlane, Nadir Shah, and others, and deprived of most of its former commerce since the discovery of the Cape of Good Hope, it has lost its splendor, traces of which, however, linger in ruins extending over 20 m., and it is still called by the natives the mother of cities.

BALL, Came of. See *BASE BALL*.

BALL, John, an English fanatical preacher in the reign of Richard II., executed at Coventry in 1381. He was a priest who had been repeatedly excommunicated for preaching "errors and schisms, and scandals against the pope, the archbishops, bishops, and clergy;" and when Wycliffe began to preach he adopted some of that reformer's doctrines and engrafted them on his own. He joined Wat Tyler's rebellion in 1381, and at Blackheath preached to a hundred thousand of the insurgents a violent democratic sermon on the text,

When Adam delved and Eve span,
Who was then the gentleman?

His sermons and letters contributed greatly to spread the insurrection. After the death of Wat he was seized with others of the leaders and either beheaded or hanged.

BALL, Thomas, an American sculptor, born in Charlestown, Mass., June 8, 1819. He was originally a portrait painter in Boston, but about 1852 began to devote himself exclusively to modelling. His first production in the plastic art was a miniature bust of Jenny Lind, which was soon followed by a life-size bust of

Daniel Webster, esteemed an excellent likeness. After executing a life-size statue of the same statesman he passed several years in Europe, and upon his return to Boston received a commission for an equestrian statue of Washington, which was cast in bronze by the Ames manufacturing company at Chicopee, Mass., and placed in the public garden of Boston in 1863. He revisited Europe in 1865, passing some time in Rome and Florence. His remaining works include a bust of Rufus Choate, statuettes of Webster, Lincoln, and Clay, a life-size statue of Edward Everett (in the Boston public library), a statue of Edwin Forrest in the character of Coriolanus, one of Eve, and a number of ideal busts and statues. In 1871 his statue of Gov. Andrew of Massachusetts was placed in the state house at Boston.

BALLANCHE, Pierre Stmes, a French writer and philosopher, born in Lyons in 1776, died in Paris, June 12, 1847. He first followed the trade of his father, who was a bookseller and a printer. In 1801 he published *Du sentiment considéré dans ses rapports avec la littérature et les arts*. In 1814 appeared his historical novel *Antigone*, and subsequently an *Essai sur les institutions sociales dans leurs rapports avec les idées nouvelles*, in which he sought to reconcile national tradition with the progressive law of modern society. These works made little impression upon the general public; but his *L'homme sans nom* (1820), a novel which bitterly denounced some old revolutionary leaders, was more successful. After this publication Ballanche, who had previously removed to Paris, devoted himself to purely speculative studies. In spite of their abstruseness, his subsequent works were eagerly sought for. In *Orphée* he symbolically expounded the way in which every great social evolution must be accomplished. The *Prolegomènes*, which serve as an introduction to *Orphée*, and his great work *Palingénésie sociale*, contain a full exposition of his prophetic and mystical theories. These theories are summed up, though not made more intelligible, in *La vision d'Hébal, chef d'un clan écossais*, which was his last publication. He was much respected by Chateaubriand and Mme. Récamier.

BALLANTYNE, I. James, a Scottish printer, born at Kelso in 1772, died in Edinburgh, Jan. 17, 1838. He was a schoolfellow of Walter Scott at Kelso grammar school. In 1795 he began practice as a solicitor in his native town, and the next year started a weekly journal called the "Kelso Mail," to which Scott contributed. By the advice of the novelist he removed to Edinburgh, to carry on the printing business. The first volumes issued from what he called the "Border Press" were the first and second of Scott's "Minstrelsy of the Scottish Border," brought out in a manner greatly superior to any Scotch printing of that time. The third volume followed in 1803. From that time he printed all of Scott's works, and the Ballantyne press attained a high reputation. From

1805, when the "Lay of the Last Minstrel" was published, to his failure in 1826, Scott was a secret partner with Ballantyne, not only in the printing business, but in the proprietorship of the "Edinburgh Weekly Journal," which Ballantyne conducted with spirit and success. Ballantyne was in the secret of the authorship of "Waverley," and was almost the only person to whose criticism and suggestions Scott paid any attention. For many years he printed "Blackwood's Magazine;" and in 1822 145,000 volumes of Scott's works were issued from Ballantyne's press. Unfortunately, Scott also became principal in a publishing house of which John Ballantyne was the ostensible head. After struggling for some years, with heavy losses, this concern was broken up, and the Ballantynes shared in Scott's misfortunes. Wilson described James Ballantyne as "the best disclaimer extant," and Lockhart said he was one of the best readers he ever heard. He was considered for 25 years the best theatrical orator in Scotland. **II. John**, brother of the preceding, born at Kelso about 1774, died June 16, 1821. After having filled the office of clerk in a London bank for some time, he returned to his native place, where he kept a clothier's shop; but he was unfortunate in business, and in 1806 went to Edinburgh as clerk to his brother James. In 1808 he became nominal head of the publishing house of John Ballantyne and company. After the failure of this concern he became a literary auctioneer in Edinburgh. His liveliness, humor, eccentricity, and convivial habits greatly endeared him to Scott, and he was repeatedly mentioned by Wilson, in "Blackwood's Magazine," for his social qualities. He wrote an unsuccessful novel, "The Widow's Lodgings," and for a short time conducted a weekly periodical called "The Sale Room," to which Scott contributed some minor poems, including the humorous piece entitled "The Sultan of Serendib, or the Search after Happiness."

BALLARAT, a city of Victoria, New South Wales, next to Melbourne and Sydney the largest town of Australia, situated at an elevation of 1,437 ft. above the sea, 66 m. W. N. W. of Melbourne. It is divided into Ballarat West and Ballarat East, separated by the Yarowee creek. Ballarat West was erected into a city in September, 1870; pop. in 1871, 40,651 (of whom 1,600 were Chinese), and with the surrounding district, 74,260. The town owes its rapid growth to being the centre of perhaps the richest gold-bearing district of the world. The public buildings in 1871 comprised a spacious hospital erected on high ground, an orphan asylum, a benevolent asylum, a public bath, a free public library, a theatre, eight banks, three town halls, and 56 churches. In the same year Ballarat had four daily newspapers. Gold was first discovered in Ballarat in June, 1851; in December, 1855, it was proclaimed a municipality. Some of the gold mines were in 1871 as deep as some of the coal

pits in England, with horses employed in them, and worked by expensive steam machinery. In all it was estimated that there were on the Ballarat gold fields 215 engines of 6,461 horse power engaged in surface mining, and 140 engines of 3,390 horse power used in quartz mining. The district around Ballarat is also well suited for farming purposes.

BALLARD, a W. county of Kentucky, separated from Missouri by the Mississippi river, and from Illinois by the Ohio; area, 500 sq. m.; pop. in 1870, 12,576, of whom 1,477 were colored. It has a moderately uneven surface, with plenty of good timber land. The soil of the southern portions of the county is quite fertile, but in the north it is poor. The chief productions in 1870 were 70,794 bushels of wheat, 577,759 of corn, 28,223 of oats, 18,198 of Irish and 17,220 of sweet potatoes, and 2,863,455 lbs. of tobacco. Capital, Blandville.

BALLENSTEDT, a town of the duchy of Anhalt, Germany, at the foot of the Lower Hartz, on the Getel, 15 m. S. E. of Halberstadt; pop. in 1867, 4,500. Count Esico IV. of Ballenstedt founded about the middle of the 10th century a collegiate church, which was soon afterward changed into a Benedictine convent. After 1525 a castle took the place of the convent, which had been destroyed by the peasants. In 1765 it became the residence of the dukes of Anhalt-Bernburg.

BALLET (Gr. *βαλλίζειν*, It. *ballare*, to dance), a dramatic representation composed of dancing and pantomime with music. Many passages in the Greek writers show that the ballet of action was in great credit among them. The Romans reached in it, under the reign of Augustus, a rare edgree of perfection. Three dancers above all, Bathyllus, Pylades, and Hyllus, accomplished wonders by their varied performances, in which artistic skill and truthfulness of pantomime were admirably blended. Pylades personified tragic subjects, while Bathyllus excelled in the representation of the comic. These entertainments continued popular down to the fall of the empire; but it was only in the later period that women appeared on the stage; and among the most favorite performers at Constantinople was Theodora, who became the wife of the emperor Justinian. The middle ages present no records of the ballet; but in 1489, on occasion of the marriage of the duke of Milan, a spectacle of the kind excited such admiration that it was introduced in several countries. France was foremost in encouraging this entertainment; in 1581 Catharine de' Medici had a great ballet performed, "Circe and her Nymphs," the expenses of which amounted to 3,600,000 livres. The popularity of the ballet all over Europe was increased in the 18th century by Noverre, whom Garrick called the Shakespeare of the dance. He elevated the character of the ballet, improving it as a whole and in its details, and propagated its principles through the principal European cities, where he was either the foun-

der or the reformer of the ballet; finally, he returned to France, and became chief ballet master of the royal academy of music. "A ballet perfect in all its parts," according to Noverre, "is a picture drawn from life of the manners, dresses, ceremonies, and customs of all nations; it must be therefore a complete pantomime, and through the eyes speak to the very soul of the spectator, and, being a regular representation, ought as far as possible to be under the general rules of the drama. If it does not point out, with perspicuity and without the aid of a programme, the passions and incidents it is intended to describe, it is a divertissement, a succession of dances, and nothing better." Appropriate music is also a constituent part of a good ballet. The Vestris family shone on all the European stages during the latter part of the 18th century, and early in the 19th. Besides the *ballet d'action* or ballet pantomime, which is the only genuine ballet, there are *divertissements*, consisting of little else than steps, leaps, *pirovettes*, and *entrechats*. These are sometimes introduced in operas, as in *Robert le Diable*.

BALLINA, a seaport town of Ireland, county Mayo, separated from county Sligo by the river Moy, 7 m. from its mouth in Killala bay, and 57 m. N. of Galway; pop. about 5,500, including the suburb of Ardnaree, on the right or Sligo side of the Moy, and 1,800 inmates of the union workhouse. Ballina is well built, in a fine situation. It contains a parish church and several Protestant chapels, and has considerable agricultural industry and important salmon fisheries. Its trade has of late years largely increased. The town was captured by the French in 1798.

BALLINASLOE, a town of Ireland, in Connaught, 84 m. E. N. E. of Galway; pop. in 1871, 3,200. The river Suck divides the town into two parts, the larger of which is in county Galway and the other in Roscommon; they are connected by bridges and causeways, over which passes the road from Athlone to Galway. It is a handsome town, and has enormous horse fairs and an active trade in grain.

BALLING, *Karl Joseph Napoleon*, a Bohemian chemist, born April 21, 1805, died in Prague, March 17, 1868. He studied in Prague and became professor of chemistry in that city. He introduced the use of the saccharometer in breweries, distilleries, and the manufacture of beet-root sugar. His principal work is *Die Gährungschemie wissenschaftlich begründet und in ihrer Anwendung auf Weinbereitung, Bierbrauerei, Branntweimbrennerei und Hefenzeugung praktisch dargestellt* (4 vols., Prague, 1845-'7; 3d and enlarged ed., 1864).

BALLIOL, or *Balliol*. **I. John**, king of Scotland, born about 1259, died in Normandy in 1314. He was a descendant of the eldest daughter of the earl of Huntingdon, brother of King William the Lion, and, after the death of the princess Margaret of Norway, granddaughter and heiress of Alexander III., the nearest

heir to the throne. He was opposed by Robert Bruce and John Hastings, descendants of younger daughters of the earl of Huntingdon, and by several others. (See *BRUCE*.) The claims of the rivals being submitted by agreement to Edward I. of England, he decided in favor of Balliol, but on condition that he should do homage to him for the crown of Scotland. He was accordingly crowned at Soone in November, 1292, and in December, with the principal nobles of his party, swore allegiance to Edward at Newcastle-on-Tyne. Shortly afterward, being called upon to aid Edward against France, he renounced his allegiance, made an alliance with France, and declared war. Utterly defeated after a short and violent struggle, he was obliged to cede the crown of Scotland to the English king in 1296, who held him and his son prisoners in London till 1299. On his release, finding himself ostracized by public opinion in Scotland, he retired to his château of Bailleul in Normandy. His father and mother were the founders of Balliol college, Oxford. **II. Edward**, king of Scotland, son of the preceding, died at Doncaster in 1363. The king of England invited him over from Normandy in 1324 and 1327, merely to threaten Robert Bruce. In 1329 he was called upon by the dispossessed Anglo-Norman barons to lead them into Scotland to recover their estates there. He entered the frith of Forth, landed at Kinghorn, defeated the earl of Fife, and with 3,000 men marched across the country to meet the earl of Mar encamped on the opposite side of the river Earn with a force of 30,000. A second Scottish army lay within a few miles of Balliol's flank. During the night the invading force crossed the Earn, and with slight loss achieved an astonishing victory at Dupplin Moor, above 12,000 Scots, including the earls of Mar and Moray, and hundreds of knights and barons, falling in the battle. At Perth Balliol defeated the second army, commanded by the earl of March. The disaffected flocked to Balliol's standard, and he was crowned king of Scotland at Scone, Sept. 24, only seven weeks after his landing at Kinghorn. Balliol, having privately rendered homage to Edward III., lay carelessly at Annan, where he was in turn surprised by the earl of Moray, brother of the one slain at Dupplin, and barely escaped to England, after a reign of three months. Edward III. now took up the cause of Balliol, whom the battle of Halidon Hill, July 19, 1333, again placed on the Scottish throne. The Scots were so weakened by this defeat, that he might have retained his power had he not been too obsequious to the English monarch. By a treaty he gave up Berwick-upon-Tweed, and surrendered Berwickshire, Roxburghshire, Peeblesshire, Dumfriesshire, and the Lothians. The Scottish nation now became disgusted, and turned to the young king David Bruce; and after 1388 Balliol maintained only a nominal footing in Scotland, being most of the time a refugee in England. In 1355 Edward III. pur-

chased his claims on the Scottish throne for 5,000 marks, and an annuity of £2,000, and Balliol retired to Yorkshire. He left no issue.

BALLISTA, a military engine of the Romans, used in the siege and defence of fortified places. Neither from the description of authors nor from any carved or painted representation extant—although Trajan's column presents several specimens of these machines—can any distinct understanding be had of the principle or process of working these primitive substitutes for artillery. They were all included under one general term of *tormentum*, which, as is shown by its root *torquere*, to twist, would imply that the propulsion was given by means of the torsion of ropes or fibres. Yet the use of the term is not decisive, since *torquere* came in time to signify simply to hurl a missile by any means. Whatever may have been the method of its operation, the ballista was originally an engine for hurling stones with a parabolic ascent, in order to destroy the battlements of walls and the roofs of buildings in their fall. The ordinary ballista threw stones of three various weights, according to which standard the power of the engines was rated, as our cannon are by their calibre; these were, half a hundredweight, a hundredweight, and three hundredweight—which last appears to have been the maximum. Josephus mentions ballistæ, the destructive power of which he records as very formidable, capable of throwing their missiles with execution to the distance of a quarter of a mile. Vitruvius also mentions smaller ballistæ, which threw stones not exceeding two pounds in weight, and which seem to have been used as field artillery, and to have been plied from the rear, over the heads of the front ranks, into the enemy's lines.—In the middle ages, ballista was the term applied to the crossbow, and in the reign of Henry III. of England there was an officer named *ballistarius*, the keeper of the crossbows, whose pay was a shilling a day, and an *attiliator ballistarum*, whose duty it was to provide the harness and accoutrements of the crossbowmen. In the classics, however, the *catapulta*, not the ballista, is the large wall-crossbow, used in the place of cannon.

BALLOON. See **ÆRONAUTICS**.

BALLOT (Gr. *βάλλειν*, to throw), originally a little ball cast into a box as a mode of deciding anything; now more usually applied to suffrage by written or printed ticket, in distinction from *visa voce* announcement, or by holding up the hand, or other visible demonstration. In Athens it was the common mode of voting in the assemblies of the people, and in the courts, at first by casting pebbles into boxes, and afterward beans, white for the affirmative and black for the negative. If this mode of voting had secrecy specially in view, it accomplished it but imperfectly. The assemblies and courts were held in the daytime in public places, and the voters were separated from the popular audience only by a cordon of ropes. When,

therefore, the voters went up to the boxes and deposited their ballots, it was possible to know how they voted. Complete secrecy might have been designed in the court of the Areopagus, which made its decisions at night, and without the presence of an audience. Ostracism, which was a vote of the people for the expulsion of a citizen for a fixed number of years, was done by writing the name of the obnoxious party on a shell. It appears that the assembly of the people at Athens in a legislative capacity passed or rejected a law precisely as it was proposed, without amendment, as in modern times in France and in some of our own states a proposed measure has sometimes been submitted to the people for their approval or rejection.—At Rome secret voting by ballots or tickets was employed, the value of which was sometimes demonstrated by a result different from what might have been expected from popular opinion as openly expressed. Cicero, who did not favor the ballot, because of its tendency to diminish the power of the patricians, nevertheless admits that notwithstanding the laws had been prostrated, yet sometimes they would reappear in the silent suffrages of the people ("*judiciis tacitis aut occultis de honore suffragiis*"). Pliny objected to the ballot (*tacita suffragia*), as affording a screen to corruption; but Gibbon attests its value.—In modern times the ballot has been sometimes demanded for legislative bodies, but not often conceded, the prevailing view being that the action of such bodies ought as far as possible to be open to the observation and criticism of their constituents. It was in use in the Venetian senate, and during the reign of Charles II. was once adopted in Scotland for a short time. In many English corporate bodies, municipal as well as private, the ballot has long been in use; and perhaps it was in imitation of their elections, rather than from any settled conviction of its importance to a free election by the people, that it came to be employed in the New England colonies. Once planted there, it has never been abandoned, but on the contrary the system of open voting which was established in some of the more southern colonies has gradually given way to it. The ballot in the United States is a written or printed ticket having upon it the names of the persons for whom the elector desires to vote for the several offices to be filled at that election, with the proper designation of the office for which each is named. This in some states is so folded as to conceal the written or printed matter, and delivered to an inspector, who immediately deposits it in a sealed box, where it remains until the polls are closed, when a public canvassing of the ballots by the inspectors begins. In this mode complete secrecy is sought to be attained, and the courts have ruled that the elector cannot be compelled afterward in judicial proceedings to disclose how he voted. It being found that political managers sometimes resorted to tickets of a peculiar color, or

with marks on the back, in order that they might be able to determine and mark those who voted against them, the law in some states has forbidden the use of any other than ballots in plain white paper. The secret ballot has also been in use in France, Switzerland, Italy, and Greece. It is also now employed in the Australian colonies. The methods in use there are not uniform: in some the voter receives a ticket with the names of all the candidates upon it, from which he strikes off those he does not desire to vote for, and then deposits it in a box; in others, he designates his preference by making a mark opposite the names of his chosen candidates. A system somewhat resembling ballot voting prevails in other countries, but lacking the distinctive element of secrecy, and therefore not classed under this head. In German states the voting is by written or printed ticket delivered publicly to the officer, who reads off and records the vote immediately, and with as much publicity as if it had been given *exce vice*.—In England the ballot was proposed and received considerable support in the beginning of the 19th century, but it was not till 1830 that it became the subject of much discussion. In that year O'Connell proposed it in the house of commons, and it received 21 votes. Mr. Grote for several years afterward was its most conspicuous supporter, but it had the approval of Macaulay, Jobden, and at length Brougham, among others was noted. It was finally adopted under the leadership of the Gladstone ministry in 1872, with elaborate regulations to secure secrecy.

BALLOU. I. Hosea, an American clergyman, born at Richmond, N. H., April 30, 1771, died in Boston, June 7, 1852. He was the son of a Baptist clergyman, who was conscientiously opposed to receiving any remuneration for his professional services; and consequently he had no few advantages of education, that in learning to write he was obliged to use birch bark instead of paper, and charcoal instead of pen and ink. At the age of 19 he joined the Baptist church under his father's care; but having declared his belief in the final salvation of all men, he was excommunicated. He began to preach at the age of 21, and in 1794 was settled at Dana, Mass. In 1801 he removed to Barnard, Vt., where in 1804 he wrote his "Notes on the Parables" and "Treatise on the Atonement." In 1807 he became pastor of the Universalist church in Portsmouth, N. H., in 1815 removed to Salem, Mass., and in 1817 to Boston, where he became pastor of the second Universalist church, in which relation he continued for 35 years. In 1819 he commenced the "Universalist Magazine," which he conducted alone for several years, and afterward in conjunction with the Rev. Thomas Whittemore. In 1831, aided by his grand-nephew, Hosea Ballou, he commenced the "Universalist Expositor," a quarterly publication, to which he continued to contribute until his death. Among his published works, besides those

mentioned, are 26 "Lecture Sermons," 20 "Select Sermons," an "Examination of the Doctrine of Future Retribution" (1840), and a volume of poems, mostly hymns, many of which are embodied in the "Universalist Collection" edited by Adams and Chapin. He preached more than 10,000 sermons, none of which were written till after their delivery. Two of his brothers, Benjamin and David, also became Universalist preachers. Two memoirs of him have been published, one by his son, M. M. Ballou, the other by Thomas Whittemore (1854). Hosea, a Universalist clergyman, grand-nephew of the preceding, born at Halifax, Vt., Oct. 1, 1796, died at Somerville, Mass., May 27, 1861. In 1815 he became pastor at Stafford, Conn., and subsequently at Roxbury and Medford, Mass. In 1853 he was elected president of Tufts college, Somerville, Mass., and after visiting Europe for the purpose of studying the systems of collegiate education, he entered upon the duties of the college in 1855. In 1822 he had become one of the editors of the "Universalist Magazine," now published under the name of "The Trumpet," and in 1832, in conjunction with his uncle, he established the "Universalist Expositor," the title of which was subsequently changed to the "Universalist Quarterly." He wrote "The Ancient History of Universalism" (1829; 2d ed., 1843); edited Simond's "History of the Crusades" (1831); and published a "Collection of Psalms and Hymns for the Use of Universalist Societies and Families" (1837). III. Maria Murray, daughter of Hosea Ballou, of Boston, born in Boston in 1823. She has edited literary journals entitled "Ballou's Pictorial" and "The Flag of Our Union," and written a "History of Cuba" (1854), "Biography of the Rev. Hosea Ballou," "Life Story of Hosea Ballou," and "A Treasury of Thought; an Encyclopedia of Quotations" (1872). In 1872 he became one of the founders and chief editor of the "Boston Globe," a quarto daily journal. IV. Hosea, cousin of the preceding, born at Monroe, Mass., in 1811. He is author of a "Memorial of Bedford" and the "Divine Character Vindicated" and is a frequent contributor to the "Universalist Quarterly."

BALLSTON SPA, a post village, the capital of Saratoga county, N. Y., situated in a valley a branch of the Kayaderosawas creek, 7 m. W. of Saratoga Springs; pop. in 1870, 2,977. Its mineral springs were once extensively frequented, but have declined in popular estimation. It has a court house, bank, two weekly newspapers, and several churches. The Saratoga and Schenectady and Rensselaer and Saratoga railroads pass through the place.

BALLYMENNA, a market town of Ulster, Ireland, in county Antrim, on the river Braid, 1 m. N. N. W. of Belfast; pop. in 1871, 6,731. It is largely engaged in the linen manufacture and has weekly markets for the sale of linen, grain, and provisions. The Belfast and Northern Counties railway passes through it.

BALM OF GILEAD, a plant of the genus *amyris*, the *balsamodendron Gileadense* of De Candolle. Its leaves yield when bruised a strong aromatic scent. From this plant is obtained the balm of Gilead of the shops, also called balsam of Mecca or of Syria. This has a yellowish or greenish color, a warm and somewhat bitter aromatic taste, and a fragrant smell. It is valued as an odoriferous ointment or cosmetic by the Turks, who often adulterate it for the market. The amyris is a low tree or shrub, growing in several parts of Abyssinia and Syria. It has spreading, crooked branches, small bright green leaves growing in threes, and small white flowers on separate footstalks. The petals are four in number, and the fruit is a small egg-shaped berry, containing a smooth nut. To obtain the juice, the bark of the tree is cut at the time when its sap is in its strongest period of circulation. As the juices ooze through the wound they are received into small earthen bottles, every day's produce being poured into larger bottles and corked. When fresh, the smell of the balsam is exquisitely fragrant, but if left exposed to the atmosphere it loses this quality. The quantity of balsam yielded by one tree is said never to exceed 60 drops in a day. It is therefore very scarce, and can with difficulty be procured in a pure and unadulterated state, even at Constantinople. Its stimulating properties upon the skin are such

Balm of Gilead.

that the face of a person unaccustomed to use it becomes red and swollen after its application, and continues so for several days. The Turks use it as a cosmetic, and also take it internally, in minute doses, in water, to stimulate the stomach. It seems to have been as highly esteemed by the ancient inhabitants of Syria as it is by the modern Turks and Arabs. Josephus states that the balm of Gilead was one of the trees given by the queen of Sheba to King Solomon.—The *abies balsamea*, which furnishes Canada balsam, and the *populus balsamifera*, var. *candicans*, the buds of which are covered with a resinous varnish, are both sometimes known as balm of Gilead trees.

BALMES, Jaime Lado, a Spanish theologian and philosopher, born at Vich, Catalonia, Aug. 28, 1810, died there, July 9, 1848. He was ordained in 1832, and was for a time professor at the university of Cervera. He resisted the movements of the revolutionary party in Spain, though he sympathized with liberal institu-

tions. In his opinion, the hope of the future lay in the union between Catholicity and political liberty. His principal works are: *El Protestantismo comparado con el Catolicismo en sus relaciones con la civilizacion europea* (4 vols., Barcelona, 1842-'4), which passed through several editions, and has been translated into English and other languages; *El criterio* (Madrid, 1845; French and German translations, 1850-'52); and *Filosofia fundamental* (4 vols., Barcelona, 1846; French translation, 8 vols., 1852; English version by Henry F. Brownson, 2 vols., New York, 1857). A complete edition of his political writings appeared in 1847, and biographies of Balmes have been published in Spanish, French, and German.

BALMORAL, a summer residence of Queen Victoria, in the Scottish highlands, parish of Crathie, Aberdeenshire, on the right bank of the Dea, 44 m. W. S. W. of Aberdeen. The castle stands on a natural platform, at the foot of Craig-an-gowan, about 900 ft. above the sea. The estate was leased in 1848 and purchased in 1852 by Prince Albert. It comprises an area of over 100,000 acres, including 1,000 acres of woodland, and a deer park of 80,000 acres. The scenery is highly romantic, and the neighboring country is famous for its deer stalking, grouse shooting, and lake and river fishing. Near the Ben-a-bourd, one of the most picturesque mountains, is the monument to Prince Albert erected by the queen in 1863.

BALNAVES, Henry, a Scotch Protestant reformer, born at Kirkcaldy, Fifeshire, in 1520, died in Edinburgh in 1579. He studied in Scotland and Germany. His open profession in 1542 of the Protestant faith caused his dismissal from the office of secretary of state, after which he joined the English and was imprisoned in Blackness castle till 1544. He was implicated in the conspiracy resulting in the murder of Cardinal Beaton, declared a traitor, and excommunicated. At the siege of the castle of St. Andrews he was captured, and confined with Knox and others in the castle of Rouen, France, where he wrote a treatise on justification, which was annotated by Knox and published in Edinburgh in 1584, under the title of "Confession of Faith." On his release in 1559, he participated in the contest against Mary, became one of the negotiators of the treaty of Berwick, was reappointed to the bench in 1563, and one of the commissioners for the revision of the Book of Discipline. Subsequently he, Buchanan, and others were counsellors of Murray in the case of Mary Stuart.

BALSAM, in botany, a class of plants forming the genus *impatiens*, of the natural order *geraniaceae*. It has 135 species, most of which are natives of the East Indies and China, but some have long been known in European gardens. The generic characteristics of the balsams are a succulent stem filled with a watery juice, simple leaves growing without stipules, irregular flowers with one of the petals spurred, five stamens, distinct stigmas, and a capsule with

the valves, and remarkable for the elastic force with which it bursts and expels the seeds.

Garden Balsam.

The *I. hortensis*, balsamine, or garden balsam, a beautiful and popular annual, sometimes improperly called lady's slipper, with finely variegated white, pink, red, purple, and lilac flowers, is the best known member of this genus. This loves a moist rich soil, and is raised best from the seed in a moderate hot-bed. The juice of some of the species of *impatiens*, mixed with alum, is used by the Japanese to dye their finger nails red.

BALSAMS. By the French chemists this word is applied only to those resinous vegetable juices which contain benzoic acid; and of these there are but six, namely, the balsam of Peru, the balsam of Tolu, dragon's blood, benzoin, storax, and liquidambar. But by the Germans and English the term is not thus limited in its signification, being applied to all resins obtained from trees and shrubs, as also to some pharmaceutical preparations, dividing them into two classes—one containing benzoic acid, and the other not. The former class, consisting of the six named, are aromatic, resinous substances, composed of resin, benzoic acid, and a volatile oil, the last, according to the quantity present, tending to give liquidity to the substance. They are soluble in alcohol, and water being added resin is precipitated, making the fluid milky. In ether they are only partially soluble, and not at all in water. The peculiar smell of the balsams is lost by exposure to the air. Their taste is described as hot and acrid. The plants which furnish them belong to the orders *styracées*, *leguminosæ*, and *balsamacées*. The second class of balsams are the semi-liquid and resinous juices composed only of resin and a volatile oil, and obtained mostly from plants of the orders *coniferae*, *terebinthaceæ*, and *leguminosæ*. The turpentine, and Canada, copaiba, and guaiacum balsams belong to this class. They do not differ essentially in their properties from

the other balsams. The use of balsams is principally in medicine, but they also enter into the composition of varnishes, and are employed for some other purposes, which will be mentioned in the description of each one. Benzoin and turpentine will be treated of under their own titles.—A full history and description of the balsam of Peru, by Dr. Pereira, may be found in the "Pharmaceutical Journal" (English); and an able paper, made up of this, is published by Dr. Muspratt in his work on chemistry, with which will be found drawings and botanical descriptions of the plants producing the balsams. So much error and uncertainty has prevailed in the accounts of this substance, that very elaborate investigations have been made by Dr. Pereira and others to define its true character, and that of the plants producing it. There appear to be two balsams in Peru, one called the white balsam and the other the black, which is the real balsam of Peru of commerce. Both are obtained from the *myrospermum pubescens* of DeCandolle, the one from the fruit by pressure, the other by incision from the stem; and both are procured exclusively "from the so-called Balsam Coast in Central America," the Pa-

Balsam of Peru (*Myrospermum pubescens*).

coast of San Salvador, between lat. 18° and 20° N. Sonsonate appears to be the most important district for the production of the balsam, and the tree which there yields it is possibly a different species from the *myrospermum pubescens*, and has been temporarily called by Dr. Pereira the *myrospermum* of Sonsonate. The balsam exudes from incisions in the trunk of this tree, and is said to be an admirable remedy for effecting the speedy cure of wounds. Some of balsam is made from the flowers, oil of balsam, an excellent anodyne, from the seeds and nuts, and white balsam from the capsules. The tincture or essence of balsam, called *samito*, is extracted from these. The method practised by the Indians of preparing the w-

and black balsams are very differently described by different authorities, and these descriptions are given in the paper referred to. The black balsam is a sirup of the consistency of honey, of a deep red-brown color, translucent, of a strong smell, and an intolerably acrid bitter taste. Owing to its high price it is found profitable to adulterate it, and this is done with olive oil, oil of turpentine, and copaiba. It is tested by mixing a few drops of it with twice as many of concentrated sulphuric acid, and then adding water; if pure, a little resin is obtained. Copaiba may be detected by the smell. When pure, 1,000 parts of balsam will, by the benzoic acid it contains, saturate 75 parts of crystallized carbonate of soda. The composition of the balsam, according to Stolze, is as follows:

Brown, slightly soluble resin.....	2-40	per cent.
Brown resin	20-70	"
Oil—cinnameline	30-00	"
Benzoic and cinnamic acids.....	6-40	"
Extract	0-60	"
Loss and moisture.....	0-20	"
	100-00	"

This balsam is used in perfumery, in the manufacture of sealing wax, lozenges, tinctures, pomatums, and as a substitute for vanilla in liqueurs, chocolate, &c.—Balsam of Tolu is obtained in New Granada, South America, in the region of Tolu and Turbaco, a few miles S. of Cartagena, and also along the Magdalena river. The tree which produces it is the *Myrospermum toluiferum*. The balsam differs very little from that of Peru, only it becomes resinified more easily. Their chemical composition is the same. When fresh it is of a reddish brown color, soft like turpentine, but gradually becomes harder. It has an agreeable odor like benzoin, and a sweetish taste. It is often

the mixture heated. If no resin is present, the odor of benzoic and cinnamic acid is perceived.—Dragon's blood is the product of an East India tree, called the *calamus draco*, and is also obtained in Africa and South America from a number of other trees. It is prepared in the form of drops and small balls of a dark red color, and is also put up in sticks and irregular-shaped cakes. Its use is for coloring varnishes, staining marble, preparing gold lacquer, and for tooth powders and washes. It was formerly used in medicine as an astringent, but is now regarded as inert.—Storax is rarely met with unadulterated with foreign matters; and the various mixtures sold by this name have caused uncertainty as to its real character. It is often confounded with liquidambar, but is distinguished from it by its peculiar vanilla-like odor, which, as well as the *styrax* family of plants, from which it is procured, connect it more closely with benzoin. The species of the tree is the *officinalis*; it grows

Styrax officinalis.

in Asiatic Turkey, and the shipments of this balsam are from Trieste. It is of liquid consistency, and of gray, brown, or black color, according to its purity. Its uses are in medicine as an expectorant, and as an ingredient in ointment.—Liquidambar is the resinous product of the common sweet gum tree of the United States. It is only, however, in the warm latitudes of Mexico and Louisiana that this tree yields its balsam. This is of thin consistence, yellowish color, agreeable smell, and acrid taste. It becomes thicker, of darker color, and contains a larger proportion of benzoic acid, as it increases in age. It may be used for the same purposes as storax, but is more highly esteemed and better known in Europe than in this country.—The Chinese lac, or varnish, is described by Dr. Ure as a balsam of the benzoic acid class, and derived from the bark of the *augia sinensis*.—The Canada balsam is the gum that exudes from the balsam

Balsam of Tolu (*Myrospermum toluiferum*).

adulterated with resin, which may be detected by the fumes of sulphurous acid, which are set free when sulphuric acid is poured upon it and

fir, *abies balsamea*, of the northern states. It is collected by breaking the vesicles which form on the trunk and branches, and receiving their contents in a bottle. Its color is whitish, slightly yellow, and its odor like that of the turpentine. Its analysis is thus given by Bonastre:

Essential oil	18.6	per cent.
Resin soluble in alcohol	40.0	"
Resin soluble with difficulty	38.4	"
Elastic resin	4.0	"
Bitter extract and salts	4.0	"
	100.0	"

It is used in the preparation and preservation of objects for the microscope, and in a few unimportant medicinal compounds.—The copaiba balsam is obtained from the *copaifera officinalis*, a tree of Brazil and Guiana. It is of

Balsam Copaiba (*Copaifera officinalis*).

yellowish color, semi-liquid consistency, a bitter sharp taste, and a disagreeable suffocating smell. It will dissolve one fourth its weight of carbonate of magnesia, and continue translucent. With alkalis it gives crystalline compounds. It contains an oil that dissolves caoutchouc. Its composition, according to Durand, is:

Volatile oil	83.00	per cent.
Copaiba acid	52.75	"
Brown soft resin	1.08	"
Water and loss	7.50	"
	100.00	"

Its use is principally in medicine, for altering the secretions of the mucous membranes by which it is excreted, namely, those lining the respiratory and urinary organs. The resin is said to be more active therapeutically than the oil. It is also used for hqueurs, and for making paper transparent. It is often largely adulterated with castor oil and with turpentine.—Mecca balsam, called also opobalsam, is the product of the *balsamodendron Gileadense* of the East. Its properties are similar to those of balsam of copaiba and liquid turpentine. (See BALM OF GILEAD.)

BALTA (formerly *Jbasfogrod*), a town of Russia, capital of a circle of the same name, in the government of Podolia, on the Kodyma, a tributary of the southern Bug, 180 m. S. E. of Kamnetz; pop. in 1867, 14,528. Its suburb on the S. side of the river, now in the government of Kherson, formerly belonged to Turkey, while the chief part of the town was in Poland. It has three Greek churches, a Roman Catholic church, a synagogue, two schools, and factories of candles, soap, and tallow. It carries on a brisk trade, principally in manufactured articles, horned cattle, horses, hides, wool, and cereals. Two fairs are annually held here. In 1780 the greater part of the place was destroyed by the Russians.

BALTACCHINI. I. *Saverio*, an Italian poet, born at Barletta, April 27, 1800. He was for some time a journalist, and has published *La gioietta*, *Claudio Vannini* (Naples, 1836), *Ugone di Cortona* (1838), and other poetry, and made translations from Byron and Shelle. In 1848 he was one of the chief editors of a scientific and literary periodical and of a political journal, and afterward he was for a time prominent in politics at Naples, and president of the committee of public instruction. II. *Michele*, an Italian historian and novelist, brother of the preceding, born in Naples, Feb. 11, 1803. His *Norelette morali* (1829) and *Istoria di Masaniello* (1831) have passed through many editions. He is also the author of a historical romance and of disquisitions on the life and writings of Campanella (1840-'43) and on the philosophy of Kant (1854).

BALTA LIMAN (anc. *Phidalia*, or *Portus Miliarum*), a bay and port on the European side of the Bosphorus, in lat. 41° 10' N. and lon. 29° 8' E., between Rumili Hissar and Therapia. It was formerly a place of rendezvous for the Turkish fleets. A convention was concluded here May 1, 1849, between Russia and Turkey in which it was stipulated that Russia should have for seven years an equal right with Turkey to interfere in the affairs of the Danubian principalities, and keep there 10,000 men as an army of occupation.

BALTARD. I. *Louis Pierre*, a French architect and engraver, born in Paris, July 9, 1765, died Jan. 22, 1846. He was architect of the Pantheon and of the Paris prisons, and executed the chapels of the houses of detention of St. Lazare and Ste. Pélagie, the greater part of the hall of justice in Lyons, and other remarkable buildings; was a member of the board of public works, and in 1818 became professor at the academy of fine arts. He left many superb works descriptive of monuments and illustrated by his own plates; published the "Athénæum," a journal of art; and excelled in the engraving of historical and miscellaneous subjects. II. *Victor*, son of the preceding, born in Paris, June 19, 1805. He studied under his father and in Italy, became architect of the government and of the city of Paris, and chief superintendent in the academy of fine

arta. He directed many court festivals, restored some of the principal churches of Paris, built the church of St. Augustine, which was opened in 1868, and was the architect of the central halls in Paris. He has continued the publication of the *Grands prix d'architecture*, which had been begun by his father; prepared under the patronage of the duke de Luynes the plates for a work on Norman and Swabian monuments in Italy; and published the text and designs of the *Villa Médicis* (1847-'8), and other works. One of his earlier productions, *Le théâtre de Pompéi*, executed in Italy in 1837, gained him a medal at the Paris exposition of 1855; and his *Projet de restauration de Saint Eustache* was greatly admired at that of 1859. He was chosen a member of the academy of fine arts in 1863. **III. Prosper**, brother of the preceding, born in Paris, Nov. 1, 1796, is also an excellent architect, and became in 1850 inspector of the new Louvre buildings. **IV. Jules**, a third brother, born in Paris, June 3, 1807, is a portrait painter.

BALTIC SEA (anc. *Pelagus Scythicum* or *Mare Suevicum*; Ger. *Ostsee*, eastern sea), an inland sea of N. Europe, nearly enclosed by Sweden, Russia, Germany, and Denmark, and communicating with the Cattegat and the North sea by the Sound and the Great and Little Belt. Its extremes of latitude are Wismar, in Mecklenburg, 53° 53' N., and Tornea, on the gulf of Bothnia, 65° 51' N. Its greatest length between these points is 900 m. Its width varies from 200 to 75 m. Its area, including the gulfs of Bothnia, Riga, and Finland, is estimated at about 150,000 sq. m. This is exclusive of the Cattegat and the Skager Rack, for which a further addition of 18,000 to 19,000 sq. m. must be made.—The direction in which the Baltic penetrates inland is extremely tortuous. From its straits it runs first E. to Memel, about 300 m., then N. as far as the latitude of Stockholm, 59° 21', a further distance of 260 m. It is to these portions that the term Baltic sea is in its limited sense restricted; for at this point it separates into two great gulfs. Of these the gulf of Finland runs nearly due E. between Finland and Esthonia, while the gulf of Bothnia runs a little E. of N. between Finland and Sweden. The gulf of Finland is 250 m. long, with a mean breadth of 60 to 70 m. That of Bothnia is about 400 m. long, with 120 m. of average width, although at its narrowest part it is not above 40 m. wide. Another important inlet is the gulf of Riga or Livonia, S. of the gulf of Finland, and extending between Livonia and Courland, 70 m. from E. to W., and about 90 m. from N. to S.—The Baltic is shallow. The greatest depth, between Gothland and Windau, was found in 1871 to be 720 ft. At a depth of 600 to 700 ft., at the latter end of July, the temperature was 38° to 36.5° F. No marine plants were found in this cold area, and only a few annelids. Life was very abundant to the depth of about 300 ft., while plants were seldom

found at a depth of more than 30 ft. The entrance to the sea is crowded with islands and shoals, and as the Baltic itself has no regular tides, the varying currents, depending upon prevailing winds and changing temperature, add to the difficulties of the navigator. The western portions of the sea have a depth of not more than 16 fathoms. Toward the east it deepens, and midway between Memel and Oeland there is found from 60 to 100 fathoms water. The gulf of Finland suddenly shoals from 50 to from 4 to 16 fathoms. The gulf of Bothnia has no greater average depth, but its navigation is less obstructed by shoals and sand banks.—The basin of the Baltic is difficult to determine accurately, as, with the exception of the mountains of Sweden and Norway on the north and northwest, all its other borders stretch away in vast plains, occupying a large part of Europe. This great district is exceedingly well watered; upward of 200 rivers flow into the Baltic; the lakes in its neighborhood, with many of which it is connected by rivers, are almost innumerable; and altogether this sea receives the drainage of nearly one fifth of Europe. The most peculiar part of this basin is in its S. W. corner. Here, although the nearest mountains are those of the Hartz, yet the basin of the Baltic is not above 20 or 25 m. wide. The Elbe, which runs within 50 m. of the Baltic, flows into the North sea; so also the Eider, which rises close to its shores. These and their tributaries belong to another system; yet so flat is the country that the different waters continually unite, and a canal 3 m. long has served to connect the Baltic with the Elbe, by joining a small affluent of the latter with the Stecknitz and Trave, between Lübeck and Lauenburg. The Baltic receives, among others, the waters of the lakes of Ladoga, Onega, and Mælar, and of the rivers Duna, Niemen, Vistula, and Oder. The rivers which flow from the south and southeast are the longest. The great amount of mud and sand carried down into the sea has considerably changed its soundings in various parts, filling up the mouths of many of the rivers and harbors, and generally raising the bed of the entire sea, creating many small islets and shoals, and rendering navigation, particularly along the Danish shores, difficult and dangerous.—Being a close sea, with its entrance protected from the approach of the tidal wave, the Baltic has no tides. There is, however, observed at irregular periods a rise in the water, equal sometimes to 3½ ft. This occurs at all seasons of the year, but chiefly in autumn or winter, or at a time of heavy rain, or during lowering weather. The water maintains its height for days, and sometimes weeks, and often overflows its usual limits. Dr. Schulten, a Swede, in 1804, by a series of close observations, ascertained that this rise was occasioned, not by heavy rains, winds, melting snow, or ice, to all of which it had been ascribed, but by the unequal pressure

the atmosphere upon different portions of the surface of the sea; the greatest height of the water corresponding to the greatest depression of the barometrical column, and the greatest variation of the barometer in that region, $2\frac{1}{2}$ inches, corresponding to a rise and fall of 84 inches in the water. The waters

of the Baltic are much less salt than those of the North sea or the Atlantic ocean; the relative proportion may be stated as about $\frac{1}{4}$ to that in the North sea. The entire sea is every year more or less encumbered with ice, and its straits are usually impassable from December to April. Severe frosts have made the sea several times passable on the ice in its widest parts, between Denmark and Prussia, especially in the 14th and 15th centuries. In 1809 a Russian army crossed the gulf of Bothnia on the ice.—There seems to be no doubt that the Baltic is decreasing. The innumerable lakes which lie between it and the White sea are but the remnants

of what was once a continuous sea. This is proven by the existence of similar animals in these lakes, although these are no longer salt. A gradual drainage is no doubt lessening the volume of all the bodies of water still left in the basin of the Baltic. It is in the south that the changes have been most remarked in modern times. Lübeck, which when originally built was a seaport town, is now 12 m. from the shore. The isle of Rügen is nearly joined to the German shore, and annually extends its bounds, while the names of its various parts show that not long since that which is now one large island was a cluster of small islets. Olaf Wallin, a Swedish mathematician, calculated the rise of the shore at one inch per annum, and this is probably not too high.—The Baltic is extremely rich in fish of various kinds. Seals are found in considerable numbers, and are valuable for their oil and skins. Whales are sometimes seen. Along the shores of East Prussia and the isle of Rügen quantities of amber are collected. The countries surrounding the Baltic are all rich in useful natural products, and its waters are therefore crowded with the ships of all nations.—The ancients were but slightly acquainted with the Baltic. The origin of the name Baltic is not certainly known, some etymologists deriving it from the Danish *belt*, a girdle; some from the Lithuanian *baltis*, white, in allusion to the great quantity of snow which usually falls in its neighborhood. Others have referred it to the Balti, the family name of the kings of the Visigoths. The name, however, is old, and appears to have been first used by Adam of Bremen, who described the sea in the 11th century. The most important ports on the Baltic and its various arms are St. Petersburg, Riga, Memel, Königsberg, Danzig, Gdansk, Lübeck, Copenhagen, Carlscrona, and Stockholm.

BALTIMORE, a northern county of Maryland, bounded N. by Pennsylvania and S. by the Patuxent; area, 716 sq. m.; pop. in 1871, 10,741, of whom 47,921 were colored. The larger portion of the surface is undulating with wooded ridges enclosing fertile valleys and with bold hills often rising to a height of 800 ft. above tide water. The principal varieties of rock are granite, gneiss, hornblende, limestone, and a ledge of primitive rock running through the southeastern portion of the county. On the Great and Little Gunpowder the Patuxent, Gwynn's and Jones's falls are large cotton, woollen, and carpet factories, furnaces, foundries, paper and flour mills. Copper and iron are found in considerable quantities, and in this and Harford counties are the most productive mines of chrome in the United States. In the neighborhood of Texas and Cockeysville are extensive quarries of marble, from which came the large monuments of the capitol at Washington, and the fine-grained alum marble used in building the patent office. The soil is moderately rich. The chief productions in 1870 were 264,564 bushels of wheat, 31,182 of rye, 856,754 of Indian corn, 375,063 of oats, 201,754 of potatoes, 35,791 tons of hay, and 544,688 lbs. of butter. The value of the principal manufactures in 1866 was: flour and meal, \$2,425,987; cotton, \$2,113,414; machinery, \$1,100,000; woollens, \$435,250; iron, \$612,594; paper, \$297,400; hides and leather, \$294,981; liquor, \$162,277. The county seat was transferred in 1854 from Baltimore to Towson town.

BALTIMORE, a city of Baltimore, ranking fifth in the United States population, situated in lat. 39° 37' N., 76° 37' W., on an arm of the Patuxent from Chesapeake bay, 178 m. from Philadelphia, 36 m. by rail N. E. of W. S. W. of Philadelphia, and 181 m. from New York. The population in 1800, 26,514; 1810, 35,538; 1820, 60,625; 1840, 102,813; 1850, 212,418; 1870, 267,354. It was whites and 39,558 colored natives of the United States and foreign countries. The arm on which the city is situated is long, varying in width from $\frac{1}{2}$ to 1½ m., having its extreme breadth opposite the eastern part of the city, a suburb called Canton. This inlet gives an easy access to the city, and a harbor sufficiently capacious to contain 2,000 vessels. The harbor is divided into an outer and inner bay; the inner bay is styled the basin and has but 12 feet of water. The outer bay consists of a harbor between Fell's Point and Canton on the north and east, and Whetstone Point opposite, on the south, and is capable of floating the largest merchant ships. Owing to the accumulation of deposit for many years the harbor had at one time become shoal in numerous parts, but by proper dredging it has been made available for steamers of the largest class. The entrance to the port is defended by Fort M'Henry, situated on a point of land between the harbor and the Patuxent. It was successfully defended against the British

It was whites and 39,558 colored natives of the United States and foreign countries. The arm on which the city is situated is long, varying in width from $\frac{1}{2}$ to 1½ m., having its extreme breadth opposite the eastern part of the city, a suburb called Canton. This inlet gives an easy access to the city, and a harbor sufficiently capacious to contain 2,000 vessels. The harbor is divided into an outer and inner bay; the inner bay is styled the basin and has but 12 feet of water. The outer bay consists of a harbor between Fell's Point and Canton on the north and east, and Whetstone Point opposite, on the south, and is capable of floating the largest merchant ships. Owing to the accumulation of deposit for many years the harbor had at one time become shoal in numerous parts, but by proper dredging it has been made available for steamers of the largest class. The entrance to the port is defended by Fort M'Henry, situated on a point of land between the harbor and the Patuxent. It was successfully defended against the British

fleet in 1814 by Col. George Armistead and the force under his command. It was on this occasion that the famous song of the "Star-Spangled Banner" was composed by Francis S. Key, while a prisoner on board one of the British vessels. Fort Carroll, an immense fortification on Soller's Point flats, about 8 m. below the city, after involving the government in a heavy expenditure, has been roofed over and abandoned.—The general appearance of Baltimore is striking and picturesque. It is regularly laid out, its surface is undulating, its streets are of good width, and there is ample sewerage. An aspect of cheerful elegance prevails; the larger mansions are generally in good taste, and not crowded together, and the dwellings of the poor are generally neat and thrifty. There are very few of the large tenement houses common in other cities. The

light and cheerful appearance of the city is greatly owing to the quality of the brick used in building. The clay is of fine texture and agreeable color, and when taken from the kilns is neither a very dull nor a glaring red. The Baltimore county marble, a fine, hard, and beautifully white species of limestone, extensively employed in building churches, public buildings, and in some private residences, adds also materially to this effect. The chief points of view are known as Federal hill and Patterson park. The former stands on the south side of the inner basin, crowned by a signal station, and commands an extensive prospect of the shipping, the city to the north and west, and the river and bay. The park, comprising about 56 acres, lies to the east of Fell's Point, and overlooks the principal docks and ship yards, Canton, and the surrounding country.

Baltimore, from Federal Hill.

On the N. side of the city is Druid park, a fine pleasure ground of 600 acres, with an undulating surface, partly in wood and partly in open meadow. It has recently been purchased at a cost of about \$800,000, and its architectural decorations are as yet but few. Its chief charm is in its secluded walks, rides, and bridle paths. The annual revenue of the park is derived from a tax of one fifth of the gross receipts of the city passenger railways. Within the borders of Druid park is Druid lake, the last of the chain of costly lakes and reservoirs recently constructed to supply the city with pure water. From main elevations in Druid park, and especially from the head of Druid lake, fine views of the city and river can be obtained.—Besides the main streets, three great avenues on the east, north, and west have been surveyed, and are partly graded, paved, and built upon. These are at least 150 feet

wide, planted with trees, and form an elevated drive around the city. There are 12 public squares. The largest of the public buildings is the exchange, which contains the custom house, post office, Merchants' bank, exchange, reading rooms, a vast rotunda for public sales, &c. The Athenæum is of the Italian style of architecture; it contains the rooms of the historical society and the mercantile library association, a very flourishing institution, with a large number of members, and 26,000 volumes on its shelves. The Maryland institute "for the promotion of the mechanic arts" is a large structure, 355 ft. long by 60 wide; it is built upon piles, and over the centre or Marsh market. An annual exhibition of the products of American mechanical industry is held in the main hall, which is 260 ft. long. It also contains a library, lecture rooms, school of design, chemical school, &c. The new city hall, now

early finished (1873), is one of the finest municipal structures in the country. It occupies entire square, on Holliday, North, Lexington, and Fayette streets, and is 125 ft. in height to the top of the centre building and 2 to the top of the dome. The renaissance style predominates. The material used for the outer walls is Maryland marble, with an inner lining of brick, and the building is fire-proof. The entire cost will be \$3,000,000. The court-maze, on Monument square and Lexington street, has ample accommodations for three courts besides various offices. Near it is the cord office, a fire-proof building of solid masonry. The jail, built in 1864, and containing the modern improvements in prison discipline, is a substantial structure of hammered iron, flanked by square towers, with a high wall on the sides and rear. The penitentiary, a large brick building, adjoins it on the southeast. The city contains 189 churches, viz.: 21 Protestant Episcopal, 18 Presbyterian, 23 Roman Catholic, 55 Methodist Episcopal (of which 6 are colored), 8 Methodist Protestant, Independent Methodist, 6 African Methodist, 6 Reformed, 1 Christian, 9 Baptist, 19 Evangelical Lutheran, 3 Evangelical Association, 2 Independent, 1 Seamen's Union Bethel, Friends', 1 Universalist, 1 Unitarian, 3 Swedenborgian, 9 Jewish synagogues, and 6 United Brethren. Many of the churches are very fine. The Roman Catholic cathedral, the most imposing, is in the form of a cross, and surmounted by a lofty dome and two bell towers. The church of St. Ignatius Loyola, St. Alphonsus, and many others, are rich in architecture and decorations. Many of the Protestant churches are elegant. Of other public buildings, the state tobacco warehouses well repay inspection.—The total number of charitable institutions is 23. The more prominent of these are the new state insane asylum; the Mt. Hope tract; the Maryland institution for the instruction of the blind, in the northern part of the city; St. Mary's industrial school for girls; the orphan asylums of St. Anthony Padua and of St. Vincent de Paul; and the Baltimore infirmary, under the supervision of the Sisters of Charity. The church, on Broadway near Baltimore street, belonging to the Episcopal church, and the Union Protestant infirmary, are under the management of ladies. In the W. part of the city is an elegant edifice called the aged widows' home, and near it is a similar structure for aged men. The house of refuge and city almshouse are situated near the Frederick turnpike, about two miles from the city. During the year 1871 over \$600,000 was bequeathed by wealthy citizens to charitable purposes.—St. Mary's college, a Roman Catholic institution under the charge of the Sulpicians, with a theological seminary, was founded in 1791, and sustained itself with vigor for many years, embracing very extensive grounds and buildings, a Gothic chapel, and a library of 10,000

volumes. The seminary had 70 pupils in 1871. The college was suppressed in 1851. Loyola college, in another part of the city, supplies its place for Roman Catholics; this is under the charge of Jesuits, and was opened in 1853. In 1871 it had 158 students and a library of 21,000 volumes. The Roman Catholic female seminary of Notre Dame was chartered in 1864, and in 1871 had 170 pupils. Baltimore college was chartered in 1808, and subsequently united to the medical school under the title of the "University of Maryland," but the scientific department, independent of the school of medicine, alone went into operation. This academy was not generally flourishing, and in 1854 was finally given up, and a scientific school established in the building. The medical school, on the contrary, has always been active; at one time it stood highest in the United States, and is now in excellent condition; in 1871 it had 10 instructors and 17 students. It has a massive building on Lombard street, completed in 1812. The Washington university was established in 1828, but has never been very flourishing, and its medical school, which in 1871 had 9 instructors and 17 students, is the only department ever organized. The Baltimore female college (Methodist Episcopal) was chartered by the state in 1849, and in its course of study and power of conferring degrees is similar to the colleges for male students; it had 175 pupils in 1871. The convent of the Visitation has a very large female school under charge of the sisterhood. The first public school was opened in 1839. By one of the sections of the act providing for public education throughout the state, passed by the legislature in 1870, the control of the public school system of Baltimore is vested in the mayor and city council. The entire management of the schools is intrusted by the mayor and council to a board of 20 commissioners, one from each ward, elected annually. On Jan. 1, 1872, there were under the authority of this board the city college, 2 female high schools, 18 male and 19 female grammar schools, 26 male and 31 female primary schools, 10 day and 3 evening colored schools, and 2 schools unclassified; total number of schools, 112. Male teachers, 70; female teachers, 508; total number of teachers, 578. Number of paying pupils, 11,637; free, 13,730; total on roll Jan. 1, 1872, 25,367. Number in all the schools during 1871, 34,972; number in colored schools, 2,048; increased attendance over 1870, 7,316. The total amount expended for school purposes in 1871 was \$583,106. To those who can afford it, a charge of \$1 a term of 12 weeks is made for each pupil; all others are admitted free on application to the board of education. The Bible is daily read in all the schools, the version of King James to the Protestants, and the Douay version to the Roman Catholics, in separate apartments. The principal libraries are the state law library, containing 8,000 vols.; Odd Fellows', 21,136; and mercantile,

26,000. There are published in the city 9 daily newspapers, of which 8 are in German; 1 tri-weekly; 16 weekly, of which 8 are in German; 9 monthly; and 1 quarterly, the "Southern Review." The Peabody institute was founded by the munificence of Mr. George Peabody. His first gift of \$800,000, subsequently increased to \$1,000,000, is to establish a gallery of the finest works of art, a library of the first class, and, during certain seasons of the year, concerts and lectures. The institute, a marble building facing the Washington monument, contains the concert hall on the first floor and the library on the second floor. The library numbers nearly 20,000 volumes of standard works, and is increasing at the rate of from 4,000 to 5,000 volumes annually. It is a library of reference, and its books are free to all for use within the rooms. To the east of the present building a lot has been purchased upon which an academy of art will be erected. Johns Hopkins, a wealthy citizen, has deeded his residence and grounds near the city limits, on the Harford road, to trustees, to be held in trust after his death for a university, and has further provided for its liberal endowment.—From her several monuments, Baltimore is frequently designated as the "monumental city." In 1809 the legislature granted permission to erect a monument to George Washington. This was erected at the intersection of Charles and Monument streets, on a lot of ground given for the purpose by Col. John Eager Howard. It is a Doric column of white marble, rising from a base 50 ft. square and 85 ft. high. The shaft of the column is 160 ft. high, and is surmounted by a colossal statue of Washington 15 ft. high. The Battle monument is in the centre of Monument square, formed by the intersection of Calvert and Fayette streets. This is also

Washington Monument.

of white marble, and is 58 ft. high. It was erected to the memory of the citizens who fell in the defence of Baltimore, Sept. 12 and 13,

VOL. II.—17

1814. It consists of a square base with a pedestal ornamented at each corner with a sculptured griffin. A fasciated column rises from the base, with bands, upon which are inscribed the names of those who perished. A statue representing the genius of Baltimore surmounts the column. On North Broadway a plain marble pediment and shaft, surmounted by a statue of Thomas Wilkey, commemorates the founder of the order of Odd Fellows in the United States.—The bank of Maryland was established in 1790. The failure of this institution in 1834 caused riots in the succeeding year, when the mob sacked several houses belonging to prominent directors of the bank. In 1792 a branch of the United States bank was established in Baltimore, the charter of which expired in 1835. In 1795 the bank of Baltimore was chartered; in 1804 the Union bank of Maryland; in 1806 the Mechanics' bank; and in 1810 the Franklin, Marine, Farmers' and Merchants', and the Commercial and Farmers'. Other banking institutions were chartered subsequently, and there are now 14 national banks, with an aggregate capital of \$11,241,985; 8 state banks, with \$2,563,018; and 7 savings banks. There are 28 insurance companies, chiefly fire, with an aggregate capital of \$3,501,585, besides numerous agencies. The city has 52 hotels, 9 markets, and 8 lines of city passenger railways.—Baltimore is divided into 20 wards, and is governed by a mayor and city council, consisting of 20 members in the first branch and 10 in the second. In 1769 the "Mechanical" fire company was organized, and purchased their first engine for \$250. The paid fire department now comprises 9 engines and 8 hook and ladder companies. The expenses of the department for 1871 to Nov. 1 were \$125,197 89. The fire inspector reports 156 fires within the city limits in the same period; loss, \$475,894 87; loss by fire in 1870, \$482,717 07. In connection with the fire department there is a fire alarm telegraph with 94 stations, ramifying to every portion of the city; its cost for 1871 was \$15,249 84. The police force is governed by a board of three commissioners appointed by the legislature. Under this board are a marshal, deputy marshal, 4 captains, 8 lieutenants, and 489 uniformed patrolmen. The city is chiefly supplied with water from Roland lake, about 7 m. distant, and 225 ft. above tide. Mount Royal reservoir is near the N. limits of the city, 150 ft. above tide.—On July 4, 1828, the corner stone of the Baltimore and Ohio railroad was laid by Charles Carroll of Carrollton. This road now extends to Columbus, Ohio, a distance of 518 m., and is one of the grandest works of its kind in the world. The other railroads centring here are the Baltimore and Susquehanna, usually called the Northern Central; the Philadelphia, Wilmington, and Baltimore; the Washington branch of the Baltimore and Ohio; the Western Maryland; and the Baltimore and Potomac. The last-named road was opened for travel in 1872.

For the use of several of these railroads an immense tunnel traverses the city, with open cuts at intervals, from the western limits to tide water at Canton. There is also a railroad from Annapolis, the state capital, which joins the Washington branch road. The "Tide-water canal" has never proved productive; but the Chesapeake and Ohio canal has of late years been prosperous.—Baltimore suffered severely during the civil war, but since that time has rapidly increased both in population and commercial activity. Two lines of European steamers now start from her harbor; and through her two great arteries of traffic, the Baltimore and Ohio and the Northern Central railroads, this city is successfully competing for the trade of the west and northwest. The coasting trade is also extending. In 1871 there were inspected at Baltimore 187 steamers, with a tonnage of 40,752. Of the vessels trading to her port 398 were American, 358 British, and 58 North German. The total exports for 1871 were \$18,000,000, an increase of nearly 50 per cent. over 1870. The principal articles exported were flour and meal, grain, tobacco, cotton, rosin, oil cake, petroleum, bacon, butter, cheese, and lard. The principal articles imported were coffee, sugar, guano, hides, iron, tin plates, cotton, flour, grain, and naval stores. The receipts of Cumberland coal for 1871 were 1,458,920 tons; of grain, 11,774,303 bushels; of cotton, 112,089 bales; of naval stores—spirits turpentine 22,852 bbls., rosin 79,352 bbls., tar 11,302 bbls., pitch 1,941 bbls. The inspections of flour were 1,128,028 bbls.; of tobacco, 49,571 hhds.; of leather, 352,646 sides. Importations of sugar, 126,619 hhds., 49,129 bags, 55,044 boxes; of coffee, 558,995 bags. The canning of oysters, fruits, and vegetables is estimated to reach the annual value of \$5,000,000. The boot and shoe trade is also becoming one of importance. New cotton factories are building and old ones adding to their capacity; number of spindles in 1872, 137,000; number of bales of cotton used, from 40,000 to 50,000. The productive industry of Baltimore comprises 2,261 establishments, employing 28,178 hands, with a value in products of \$51,106,278. The assessed value of property within the city limits, which is much below its real value, is \$207,181,550. The debt of the city is \$27,809,025 47. From this are to be deducted \$12,023,006 25, on which the interest is provided for by various works of public improvement, and \$10,786,886 16 invested in other productive investments; actual debt, \$4,999,071 06; unproductive investments, \$4,477,864 79.—It was not till 1729 that the assembly of Maryland passed an act entitled "An act for erecting a town on the north side of the Patuxent in Baltimore county," although settlements had been made at an earlier date, the first of which was by Charles Gorsuch, a Quaker, who in 1662 patented 50 acres of land on Whetstone Point, opposite the eastern section of the present city. In 1682 David Jones, the

first settler on the N. side of the harbor, gave his name to the small stream which now divides Baltimore into "old town" and "new town." On Jan. 12, 1730, a town of 50 acres was laid out W. of Jones's falls, and called Baltimore in honor of Cecilius Calvert, Lord Baltimore. In the same year William Fell, a ship carpenter, having purchased a tract E. of the falls, called it Fell's Point. In 1739 a new town of 10 acres, in 20 lots, was laid out on the east of the falls, and called Jonestown, in honor of David Jones, the first settler. This name has long been forgotten, and as a settlement existed there before that of Baltimore, it was called "old town." Jonestown was united to Baltimore in 1745, dropping its own name, and two years afterward Baltimore, which properly lay up about the head of the "basin," near the foot of the present South Charles street, was extended as far eastwardly as Jones's falls, under an express provision that there was nothing in the act recognizing a right to "elect delegates to the assembly as representatives from the town." This was the earliest manifestation of that singular jealousy which has ever since been shown in the legislature by the Maryland county members against the city of Baltimore. In 1752 Baltimore contained but 25 houses and 300 inhabitants. In 1756 several of the unfortunate Acadians took refuge in Baltimore, and were hospitably received. The county town was removed from Joppa to Baltimore in 1767, and the courts and records were established there; during the next year provision was made for the erection of a court house and prison. The court house stood upon the site of the present Battle monument in Calvert street, but much higher, and the whipping post was to be seen adjoining till 1808, when the old court house was pulled down. In 1773 William Goddard began the first newspaper in Baltimore, entitled the "Maryland Journal and Baltimore Advertiser." In the same year communication was opened with Philadelphia by means of stage coaches and sailing packets, and a theatre was also erected on Albemarle street. In 1775 Baltimore contained 564 houses and 5,934 inhabitants. In 1776, Philadelphia having been taken by the British, congress established itself in Baltimore, in Jacob Fite's building, on the S. E. corner of Baltimore and Liberty streets. John Adams says of this building in his journal: "The congress sits in the last house at the west end of Market street (as Baltimore street was formerly called), on the south side of the street; a long chamber with two fireplaces, two large closets, and two doors. The house belongs to a Quaker, who built it for a tavern." The place where this "last house at the west end" once stood is now in the very heart of the city. In 1780 the first custom house more was established; before the registers and clearances were obtained at Annapolis. In 1784 the first market house stood near the intersection of Mark

street, having been found inadequate to supply the wants of an increasing population, was superseded by three new ones: the centre or Marsh market, the Hanover, and the Fell's point market. At the same time, 1784, the streets were lighted with oil lamps, and three constables and 14 watchmen were appointed for the security of the town. At the close of the revolutionary war the commerce and trade of the city rapidly increased, and a large number of intelligent merchants settled here. Some of the most enterprising of these were from the north of Ireland, of Scotch descent, and by their exertions and wealth Baltimore became famed as a commercial port. Lines of packets and stage coaches were established for communication with points on the shores of Chesapeake bay, as well as in the interior of the state; in 1787 turnpikes were authorized to Washington, Frederick, and Reistertown, but were not fully completed till 1809. In 1789 the course of Jones's falls within the city, which ran along the site of the present court house, was altered by cutting a new channel from Bath street to Gay street bridge, and the old bed of the stream was filled up. In 1792 a large number of refugees from Santo Domingo came to the city, where many of their descendants still reside. In 1796, the population being about 10,000, and the town having attained a high degree of prosperity, it was erected into a city, the corporation being styled "the mayor and city council of Baltimore," and James Calhoun was elected as the first mayor. Since that date the city has rapidly increased in population. On April 19, 1861, a body of federal troops, comprising a portion of the 6th Massachusetts regiment and the 7th Pennsylvania, while passing through Baltimore on their way to Washington, were attacked by a mob with missiles and firearms. In the conflict which ensued 9 citizens were killed and 8 wounded, and 2 soldiers were killed and 23 wounded. For several days great excitement prevailed in the city, which caused President Lincoln, at the instance of the mayor of Baltimore and the governor of Maryland, to issue an order that no more troops destined for Washington should be brought through Baltimore. Communication with the city and the removal of stores therefrom were suspended by order of the mayor and board of police. On May 13 Gen. Butler, who had taken possession of the Relay House on the 5th, with a body of federal troops, took military possession of Baltimore. He was succeeded by Gen. Banks, and on July 19 Gen. Dix assumed command of the troops stationed at Baltimore, and the city thenceforth remained peaceful and tranquil.

BALTIMORE, Lord. See CALVERT.

BALTIMORE BIRD, or Baltimore Oriole (*gphantes Baltimore*, Vieill.), a bird belonging to the family of *sturnidae* (starlings), and peculiar to the American continent, which it inhabits from Canada to Brazil. It is the most beautiful of our summer visitors, and is universally ad-

mired, both for the richness of its plumage and the sweetness of its song. It is also called "golden robin," "hang bird," and "fire bird." The adult male has the head, neck all round, fore part of the back, wings, and tail, black; quills, excepting the first, margined with white; the whole under parts, the lesser wing coverts, and the posterior part of the back, bright orange, tinged with vermilion on the neck and breast; the tips of the two middle tail feathers, and the ends of the others, of a dull orange; bill and feet, light blue; iris, orange; length, $7\frac{1}{2}$ inches; extent of wings, 12 inches. This is the plumage of the third year, before which the colors are less bright, and more or less mixed with olive, brown, and white. The female is half an inch shorter, with the head, neck, and fore part of the back brownish black, mixed with dull yellow; hind part of the back light brownish yellow, brightest on the rump; lower parts duller than in

Baltimore Oriole.

the male. The orioles enter Louisiana, probably from Mexico, in early spring, and gradually make their way north, to return in autumn. Their motions are very lively and graceful. They are often seen clinging by the feet in search of insects, which form their principal food in the spring. Their song consists of from four to ten loud, full, and mellow notes, very agreeable to the ear. The nest is placed at the bottom of a very skilfully constructed network of strings and fibres, suspended, like a pouch, from the end of a branch, and shaded by overhanging leaves. The eggs are from four to six in number, about an inch long, of a pale brown color, spotted, dotted, and lined with dark brown. The period of incubation is 14 days. In Louisiana two broods are reared in a season. During migration their flight is high and straight, and mostly during the day. (See ORIOLE.)

BALTZER, Johann Baptist, a German Roman Catholic theologian, born at Andernach, July 16, 1803, died in Bonn, Oct. 1, 1871. He left the university of Bonn in 1827, was ordained in Cologne in 1829, received his diploma as doctor of divinity at Munich in 1830, and subsequently became professor at Breslau. He was a disciple of Hermes, but afterward inclined to the philosophical school of Anton Günther. The holy see requested him to relinquish his professorship, but he would not resign, though he discontinued his lectures. His course was approved by the ecclesiastical authorities of Berlin, but his subsequent protest against the Vatican resulted in his suspension. In 1853 he went to Rome at the request of Cardinal Schwarzenberg for the purpose of preventing the proposed condemnation by the pope of Günther's writings. One of his early works is *Hinweisungen auf den Grundcharakter des Hermeneutischen Systems* (Bonn, 1833); and among his subsequent writings, indicating his partial conversion to Günther's teachings, is *Beiträge zur Vermittelung eines richtigen Urtheils über Katholicismus und Protestantismus* (3 vols., Breslau, 1839-'40).

BALTZER, Wilhelm Eduard, a German clergyman and author, born at Hohenleisse, Prussia, Oct. 24, 1814. He studied in Leipzig and Halle, became a tutor, and was chaplain of the hospital of Delitzsch from 1841 till the beginning of 1847, when he founded at Nordhausen a free religious community, after having failed to have his nomination to various dioceses confirmed by the authorities. In 1848 he was elected to the Frankfurt preliminary parliament, and afterward to the Prussian national assembly. He continues to preside over the community at Nordhausen (1873), and has acquired great influence by his sermons and publications. In 1868 he founded a society and a journal for the promotion of vegetarianism; and he published in 1870 on the same subject *Die sittliche Seite der naturgemässen Lebensweise*. His writings include *Das sogenannte Apostolische Glaubensbekenntnis* (Leipzig, 1847); *Allgemeine Religionsgeschichte* (Nordhausen, 1854); *Alte und neue Weltanschauung* (1852-'9); *Das Leben Jesu* (2d ed., 1861); *Von der Arbeit* (1864); *Das preussische Verfassungsbüchlein* (4th ed., 1864); *Gott, Welt und Mensch* (1869); and *Religionslehrbuch für Schule und Haus freier Gemeinden* (1st part, containing *Lehrbuch für den ersten Unterricht*, 2d ed., 1870).

BALZE, Jean de la, a French prelate and statesman, born at Verdun about 1422, died in Ancona in October, 1491. Having become a priest, he ingratiated himself with the bishop of Poitiers, became his executor, defrauded his heirs, trafficked in preferments, and succeeded in gaining the confidence of Louis XI., who made him secretary, almoner, bishop of Evreux, and eventually prime minister. About 1466 his efforts for the abolition of the "Pragmatic Sanction" gained for him from Pope Paul

II. a cardinal's hat. Having been detected in a treasonable correspondence in 1469, the king confined him at the castle of Loches in an iron cage, from which he was released after years at the solicitation of Pope Sixtus IV. who showered wealth and honors upon him, and sent him as legate to Paris. Upon the death of Sixtus (1484) he fled from France, but Pope Innocent VIII. made him bishop successively of Albano and of Preneste, and protector of the order of Malta.

BALFFLI, Gastone, an Italian prelate, born at Ancona, March 29, 1788, died in Imola, Nov. 11, 1866. He spent a considerable time as nuncio in South America, and is said to have been accompanied by the abbé Mastai Ferretti, afterward Pius IX., whom he succeeded as bishop of Imola, and was appointed cardinal Dec. 21, 1846, and archbishop in 1860.

"*Religious History of America*" (Rome, 1858) contains new and interesting documents, which he found chiefly at Bogotá. A French translation of his "Divinity of the Church manifested by its Charity, or Universal Outline of Roman Catholic Charity," was published in 1858 by the abbé Postel (3 vols., Paris).

BALZAR, Étienne, a French historian, born at Tulle, Dec. 24, 1680, died in Paris, July 1718. He studied jurisprudence at Toulouse, where he became secretary of the archbishop. In 1697 Colbert made him his librarian. In 1670 he was appointed professor of canon law in Paris, retaining these offices till 1707. Louis XIV. placed him in 1707 at the head of the royal college, but, displeased with his *Histoire générale de la maison d'Autriche* (10 vols., 1708-'9), caused his work to be suppressed, threw him into prison, and confiscated his property. He was set at liberty in 1711, but did not recover his position. Besides 1,000 MSS. in the national library of Paris, he had 45 printed works, including *Regum Francorum Capitularia* (new ed., 2 vols., Paris, 1780), *Miscellanea* (7 vols., 1678-1715; new ed., 2 vols., Lucca, 1761). He was a prominent champion of the liberties of the Gallican church. His *Vies des papes d'Aignon* (3 vols., 1698) was placed on the Index by the Roman curia. He rendered great services to literature by collecting authentic MSS., comparing them with printed editions, and publishing annotations full of erudition. His house was a favorite resort of scientific and literary men, who were assisted in every way. He introduced the custom of long banquets for the promotion of intellectual intercourse, which became so fashionable during the 18th century.

BALZAC, L. Honoré de, a French novelist, born at Tours, May 16, 1799, died in Paris, Aug. 20, 1850. On leaving school he was placed in a notary's office. He soon became discontented with this position, and left it against the wishes of his father, to devote himself to literature. He had no facility in the art of composition, and his style was unformed. Before the age of 23, however, he had published half a dozen

novels and romances. These and many more in the next seven years, including attempts in almost all varieties of prose fiction, appeared under different assumed names, as Horace de St. Aubin, Lord R'hoone (anagram of Honoré), and Veillergré (pseudonyme of his collaborator Lepoiterin Saint-Alme). Abounding in defects of plot, incident, and style, they only give here and there a rare gleam of the excellent qualities that shine in his later writings. Some of them were written under the pressure of poverty, and merely to sell. Of their inferiority Balzac was always as conscious as his critics; nor would he consent that they should bear his name. The larger part of them have been reprinted since his death under the title of *Œuvres de jeunesse*. In 1826 he associated with himself a printer of the name of Barbier, for the purpose of carrying on an enterprise in which printing, publishing, and writing were combined, and paper-making was to have been added. It soon proved a lamentable failure, after having been long enough in operation to involve Balzac in debts that harassed him for years afterward, and from which in the end he relieved himself by the products of his pen. The first volume to which he signed his name was *Le dernier Chouan*, published in 1829, a historical novel, written in La Vendée, amid the scenes so faithfully described in its pages. His next work, *Physiologie du mariage*, drew public attention to the originality and subtlety of the author's genius; *La peau de chagrin*, in 1831 (included in his *Contes philosophiques*), increased the general admiration. From this time to the close of his life he continued to produce in rapid succession that remarkable series of romances, novels, and tales to which he gave the general title of *Comédie humaine*, including his celebrated *Scènes de la vie privée*, *Scènes de la vie de province*, *Scènes de la vie parisienne*, &c.; *Études philosophiques*, and *Études analytiques*. He proposed to himself nothing less than the complete delineation of every phase of modern French society. This great work, with all its natural limitations and manifold defects of execution, yet remains a marvellous monument of genius and industry. Portions of it considered as independent works, such as *Eugénie Grandet*, *César Birotteau*, *Le père Goriot*, and *Les illusions perdues*, are masterpieces in themselves. Among his other works are: *La fille aux yeux d'or*; *Mémoires de deux jeunes mariées*; *Les parents pauvres*; *Le contrat de mariage*; *Vautrin*; and *Contes drôlatiques*. According to his sister, between 1827 and 1848 he wrote 97 works, containing nearly 11,000 pages, and thrice as large as ordinary octavo volumes. Most of his works have been translated into the principal foreign languages. Among the many biographies of him, the most interesting are those by his sister Laure and Théophile Gautier (Paris, 1859). His best works are distinguished for depth, acuteness, and boldness of observation, but his minute accuracy of external description and ful-

ness of detail often become wearisome, clog the movement of the story, and detract from the interest that should centre round the main figures. He is sometimes gross even to cynicism, which he mingles with traits of exquisite purity and delicacy; but both the grossness and delicacy generally reside in his subjects. He rarely projects his own personality. It has been regretted that he had no high ideal; but that did not enter into his system of art. He aimed only to present the realities of life. He advances no theory, pretends to no moral teaching. Treating largely of female emotions, he found among women his warmest admirers. On occasion of the publication of his *Médecin de campagne* in 1835, he received a complimentary letter from the countess Evelina Hanska, a Polish lady, which was the commencement of a long and intimate correspondence. After her husband's death, Balzac went to Poland and married her (1848). His health was already seriously impaired by excessive work and by drinking coffee in large quantities as an habitual stimulus. A few months after his return from Poland, and after having fitted up his house in the rue Fortunée (Champs Élysées) with exquisite works of art for a permanent residence, he died of hypertrophy of the heart, and was buried at Père Lachaise, amid an immense concourse of people, Victor Hugo pronouncing the funeral oration. **II. Laure de**, sister and biographer of the preceding, born in 1800. She married M. Allain, surnamed Surville, an engineer. She wrote fairy tales and other stories for her children, which have acquired great popularity. Her brother's novel, *Un début dans la vie* (1842), was founded upon one of her tales entitled *Le voyage en Coucou*. She published in 1858 *Balzac, sa vie et ses œuvres*, containing his correspondence and many interesting details of his life.

BALZAC, Jean Louis Guez, seigneur de, a French writer, born in Angoulême in 1594, died at Balzac, Feb. 18, 1654. His father, a nobleman of Languedoc, and a favorite of Henry IV., assumed the name of De Balzac after a small estate on the Charente. He was a pupil of Malherbe, accompanied Cardinal de la Valette to Italy, and became his agent in Rome; and on his return to Paris, when his correspondence had established for him a high literary reputation, he became one of the most admired visitors of the hôtel Rambouillet, a favorite of the bishop of Luçon, afterward Cardinal Richelieu, and a member of the newly established French academy. His rapid success excited much jealousy, especially among the old school of prose writers and the order of the Feuillants, whose general, Father Goulu, published a most virulent attack upon him. Balzac, weary of these assaults, left Paris for his country seat, and was hence called the hermit of the Charente. Toward the end of his life he often retired for religious meditation to the Capuchin convent of Angoulême, where he had two rooms built for his own use. He distributed large amounts among the poor, and be-

queathed funds to the academy for an annual prize in rhetoric, which is still distributed. He was greatly admired by Christina of Sweden, to whom he dedicated his *Aristippe*. His *Prince*, a fulsome eulogy of Louis XIII., and written in the pompous style characteristic of *Le Socrate chrétien* and of most of his works, was censured by the Sorbonne. He contributed much, however, to improve prose writing, especially by his *Lettres* (new ed., 3 vols., Paris, 1806). A complete edition of his writings by Cassaigne in 2 vols. folio appeared in Paris in 1665, and a select edition by A. Malitourne in 2 vols. 8vo in 1823. D. F. Moreau de Méran published *Pensées de Balzac* in 1807. About 200 of his MS. letters to Chapelain have lately been published by the committee of historical monuments, and included in a volume entitled *Mélanges*.

BAMBARRA, a district in the N. W. central part of Africa, between lat. 10° and 15° N. and lon. 6° and 9° W. The eastern part is a nearly level plain, subject to overflow by the rivers, which turn a considerable portion of it into marsh. The western portion is hilly, and includes the eastern sides of the Kong mountains. The climate is sultry except in the hilly portions. The rainy season begins in the middle of June, and continues with violent winds and thunder until November. The principal river is the Joliba or Niger, which descends from the mountains near the western boundary. Numerous villages lie upon the banks of this stream. Bambarra produces a great variety of garden vegetables; the indigo plant, which grows spontaneously; the butter tree, which yields an ash-gray butter, an article of trade; and some singular fruits, one of which, the *rhamnus lotus*, is acid in taste and resembles gingerbread in color. Many districts have extensive forests and fine pastures. Horned cattle, sheep, goats, and horses of a fine breed are numerous. Poultry abounds. The rivers supply an abundance of fish, which, when dried, is an article of considerable trade. The aborigines, who are the peasantry of the country, are barbarous. The Moors, who have established themselves in the towns along the Joliba, exercise a great degree of authority with the petty sovereigns of the country, and with the Mandingoes and Foulahs, two large negro tribes from the Kong mountains, who are Moslems. They compose the great part of the population of the towns, and are mechanics and merchants. The towns inhabited by these tribes and the Moors are independent of the rule of the petty independent chiefs. Bambarra has a very active trade. The Mandingoes export ivory. The Moors carry on extensive commerce through the Sahara with the countries along the Mediterranean. Besides gold, the principal articles of commerce are slaves, ivory, and coarse cotton cloth, which are exchanged for salt from the desert, tobacco, hardware, &c. Chief town, Sego; other important towns, Bammakoo, Nyamina, and Samanding.

BAMBERG, a town of Bavaria, in the circle of Upper Franconia, on the Ludwig's canal and the river Regnitz, about 4 m. above its confluence with the Main, 33 m. N. N. W. of Nuremberg; pop. in 1871, 25,748, including 3,000 in the garrison. The inhabitants are chiefly Roman Catholics. The town is well built on eminences in a delightful and fertile region, and is divided by the Regnitz, which is crossed by five bridges. The ditches of the old ramparts have been converted into gardens and promenades, the finest of the latter being the parks of the Theresienheim on the Ludwig's canal. The most remarkable public buildings are the cathedral, one of the finest in Germany, rebuilt in Byzantine style with monuments of the emperor Henry II. and his consort Cunigunda and of Pope Clement II., and with paintings by Tintoretto and Vandyke; and the former university and present parish church of St. Martin, built by the Jesuits at the end of the 17th century, noted for its internal beauty, with a college and library. The collegiate church of St. Stephen is Protestant. The town contains an infirmary founded by Bishop Erthal, several medical schools, and a botanical garden; a lyceum, once a university and afterward an academical gymnasium, with complete courses of theology, philosophy, and medical science; a normal school and many other schools. The royal library contains nearly 60,000 volumes, and there are many learned, artistic, and philanthropical institutions and associations. The principal corporation is that of the gardeners, with over 700 members and a triennial prize for officinal plants. The export of plants, vegetables, fruits, and seeds, and especially of hick ice, is considerable. There are over 60 breweries. Cotton weaving employs over 1,500 persons. The transit trade has been much increased by railways as well as by the Ludwig's canal, which, extending from the Regnitz to the Altmühl, unites the Main, and through it the Rhine, with the Danube. The view from the ruined castle of Altenberg is among the finest in Franconia. The town is supposed to have derived its name and origin in the 9th century from this castle of the counts of Babenberg, where Philip of Swabia, the competitor of Otho IV. for the crown of Germany, was murdered in 1208 by Otto of Wittelsbach. Bamberg was formerly an independent bishopric; the 61st and last prince-bishop, Buseck, who died in 1805, retired with a pension of 40,000 florins after the secularization of the see in 1801. The bishopric then included an area of 1,400 sq. m. and a population of 200,000. It is now an archbishopric, with jurisdiction over the bishoprics of Würzburg, Eichstätt, and Spire. The Bamberg conferences of 1834 related to the addition of the middle German states to the Austro-Prussian union.

BAMBOCCIO (little child, or simpleton), the Italian nickname of PIETER VAN LAER or LAAR, a Dutch painter, so called either from his funny

appearance (according to some accounts he was a cripple), or because he chose his subjects from low life (*bambocciate*), born at Laaren, near Naarden in 1618, died in Haarlem in 1678. He spent 16 years in Rome, living and working with Poussin and Claude Lorraine, and acquiring celebrity by his pictures of the wild haunts of robbers, of mobs at public gatherings and festivals, and other delineations of low life in Rome and its vicinity. In such subjects he was the best artist of his day, but Wouverman's superior finish was said to have affected him to such a degree that he killed himself. Many of his pictures are in Vienna, Augsburg, and Florence. He etched plates from his own designs, and excelled as a violinist.

BAMBOO (*bambusa arundinacea*), a genus of arborescent grasses found in Asia, and in the West Indies, but more extensively used in China than any other country. It has a hard woody texture where the plant has attained any considerable growth, with hollow jointed stems. These are externally coated with siliceous matter, and the plant sometimes secretes the same substance between the joints in lumps, when it is called *tabasheer*. The Chinese reckon an endless variety of it, one Chinese botanist observing that he could not name all the kinds, but would enumerate 88 of the principal varieties. The bamboo occupies an intermediate place between grasses proper and trees, from its size frequently appearing like a tree, but displaying gramineous affinities in its internal structure. Like all grasses, it is nourished from the pith, and starts from the ground at nearly the same

tances between the joints from 4 to 6 inches in some varieties, and in others, highly prized, from 4 to 5 feet. The leaves are small and oval, without much diversity of form, but some-

Bamboo Leaves, Flowers, and Fruit.

times of a reddish and bluish hue. The color of the stems is generally yellow, but the Chinese possess secret arts of changing this to chestnut, black, &c.; the black bamboos are cultivated in the gardens of the rich like any other rare plants, and the emperor is said to have an officer connected with his palace whose sole duty is to attend to the bamboos in the imperial gardens. The culture varies greatly according to the soil, the exposure, and the variety of the plant. It generally requires a sandy soil, where the roots will easily penetrate, and it is extensively grown along the shores of rivers, partly to give support to the banks, although the plant dies if its roots touch the water. It is always propagated by suckers, for it requires 80 years or more to reach the blossoming period, when the plant produces a profuse quantity of seed and dies. Often all the mature bamboos in a large district flower at once and then die, only the rootstocks remaining to send up new shoots. The seeds are edible, and in 1812 a famine was averted in Orissa by the general flowering of this grass. In 1864 the bamboo flowered in the Soopa jungles, and about 50,000 people gathered the seed, camping in the jungle for several weeks. Planting generally takes place in the spring and autumn, and requires very slight care; four or five years elapse before a plantation is considered ready to cut, and for this the winter season is deemed the best, as the wood is then the hardest.—The bamboo may indeed be styled the national plant of China, and the uses to which it is put by the natives are almost innumerable. The young and tender shoots are boiled and eaten, or preserved by the confectioners, and as sweetmeats are delicious. The roots serve many curious purposes.

Bamboo.

diameter it bears in maturity. It usually grows to a height of 40 or 50 feet, and beyond that size is regarded as extraordinary. In diameter it varies from 1 to 8 inches, and in the dis-

The tubes are in constant use in many departments of human industry; not only are entire houses and boats made of them in some cases, but various kinds of ornamental screenwork for interior decoration; also the yards of vessels and the tacking poles by which boats are impelled in calm and shallow waters. The straightest of the tubes have been used for astronomical purposes, and cheap aqueducts are in common use, formed by fitting the ends together. Sheds are made from the bamboo by softening it in water and flattening the sections, and these when split finer are made into rain cloaks. Floats to tie on the backs of little children who live in the boats on rivers, as well as the poles by which strong coolies carry burdens, come alike from the plant. Water wheels, fences, rope, chairs, tables, bookcases, boxes, hats, umbrellas, pipe sticks, fans, fan cases, cups, measures for grain, shields, pike and spear handles, and paper, all are formed from bamboo. The pith is used for lamp wicks, and exquisite carvings inlaid with gold and silver, and far more elegant than ivory work, are produced from the hard stems. From the large quantity of silex in the wood, thin slices make good knives. In the islands of the Indian ocean, the bamboo, like the breadfruit tree and the cocconut, enters largely into the industrial arts of all the various races. The Battaks and the Redjungs of Sumatra write on small polished joints of bamboo, about one inch in diameter, beginning at the top and descending spirally to the bottom. In Barmah the bamboo is so extensively used in the construction of houses, that large cities, such as Rangoon and Prome, are composed almost entirely of bamboo. These houses are lashed together, not nailed, and easily struck and removed like tents.—The family *bambusaceæ* comprises 20 genera and 170 species already described. Of these only one is found in America north of Mexico, none in Europe, and but one is native to Africa; and only one is common to both hemispheres, differing in this respect from all other grasses.

BAMBOOK, a country in the interior of Africa, between lat. $13^{\circ} 30'$ and $14^{\circ} 30'$ N. and lon. $10^{\circ} 30'$ and $12^{\circ} 15'$ W. It is about 140 m. in length, and 90 in breadth. It is rugged, though the greatest elevation nowhere exceeds 600 ft., and is watered by the head streams of the Senegal. The higher region is barren and naked, but the lower supports an exuberant vegetation. The baobab, tamarind, and palm trees reach the greatest dimensions. The soil produces almost without culture maize, millet, cotton, melons, and a great variety of leguminous plants. Rice is yielded by the low lands, which are subject to overflow. Large herds of cattle roam over the plains. Lions and elephants are numerous. Bambook has rich gold mines, whose product is exchanged for salt. The inhabitants are Mandingoes of a very low type, and extremely numerous. Bambook was once invaded by the Portuguese, the ruins of whose forts and houses are still to be seen.

BAMIAN, Bamyān, or Bāmiān, a valley, and ancient town of Afghanistan, about 60 m. N. W. of Cabool. The valley lies between Hindoo Koosh and the mountains of Herat, is important as the only route practicable for artillery across the Himalaya into Independent Turkistan. It is about 1 m. wide, 12 m. long, bounded on each side by almost perpendicular steep, and crowded with remains of antiquity. The town occupies the sides of the detached Ghoolghoola hill, in the middle of the valley, site of the old city of Ghoolghoola, destroyed by the Mongols under Genghis Khan in 1219. Among the relics are gigantic figures cut in rock on the hill, and supposed to be idols, some of which are over 120 ft. high. There are caverns excavated in the rocks, extending in series for upwards of 8 m. The highest elevation of the Bamian pass is about 8,500 ft., further south are passes as high as 12,000 ft. About 8 m. W. of the town are the ruins of a castle of Zohak, believed to have originated from that mythical conqueror, and where other relics were lately found.

BAMPTON LECTURES, a series of lectures or sermons preached before the university of Oxford since 1780, according to the will and endowment of the Rev. John Bampton, rector and canon of the cathedral of Salisbury. The income of the endowment is £120 per annum. Bampton lectures consist of eight annual courses, for ever, on one or more of the following themes: 1. The divine authority of Scriptures. 2. Divinity of Christ and of the Holy Ghost. 3. The articles of the Christian faith as comprehended in the Apostles' and Nicene creeds. 4. The authority of the writings of the primitive fathers as to the faith and practice of the primitive church. 5. An attempt to confirm the Christian faith, and confute heretics and schismatics. One person is chosen annually, who is to deliver the annual course between the commencement of the month in Lent term and the end of the week in Act term. The lecturer is to be chosen by the heads of the colleges; he must have taken the degree of M. A. either from Oxford or Cambridge; is never to be chosen a second time; and the lectures are to be delivered at St. Mary's church. Within two months after the delivery of the lectures, 30 copies are printed for distribution to the universities, the mayor of Oxford, and the Bodleian library. They are, however, generally published.

BAN (Hun. *bán*, a corruption of the Slav. *pan*, lord), the title of the governor of Croatia and Slavonia; formerly also of the governor of various other provinces belonging to the Hungarian crown.

BAN, a proclamation; in old English civil law, applied most commonly to an excommunication or curse publicly pronounced against those who had been or should be guilty of certain specified offences. In Germany sometimes persons, cities, or districts were placed under the ban of the empire by some public authority.

proclamation, and thereby political rights and capacities were taken away, and in case of individuals they were cut off from society and deprived of rank, title, privileges, and property.—The ban and arrière ban of France was the entire feudal levy of the realm, raised by public proclamation (ban) of the king, denouncing penalties against all who should fail to appear. The ban comprised all the great vassals, holding of the king for homage; the arrière ban included all the vassals or tenants of the second class. The whole ban and arrière ban, therefore, constituted the entire military force of the crown of France during the feudal ages, and prior to the establishment of standing armies. It could only be called out by the king in person, and usually only when he was himself in the field, although the leading of it often was given to the constable, or some other high officer of France. The calling out of the ban and arrière ban usually implied the invasion of the soil of France; the revolt of some great feudatories; or, in some serious way, the supreme peril of the crown and state. It was attended with solemn ceremonies, and on the assemblage of the powers by the displaying of the *oriflamme*, or sacred banner of the monarchy, green, langued with tongues of gold, emblematical of the fiery tongues of the Pentecost, by the count d'Harcourt, who was the hereditary holder of that office.

BANANA (*musa*), the most important of tropical fruits, now common in the tropics of both hemispheres. When the cutting or shoot is planted (and it requires deep rich earth and

leaf stems or petioles. At the end of nine months a deep purple bud appears in the centre of the leaves; its constantly lengthening stem soon pushes it beyond the leaves, and it hangs down like a huge heart. As the purple envelopes of the bud fall off rows of buds are disclosed, extending two thirds around the stem. Each miniature fruit has a waxen yellow blossom with a large projecting stigma at the end. The female flowers come first on the stem, and nearer the end are the smaller male flowers; both are full of good honey. Three or four months are required to ripen the fruit, and during the process the rows of male flowers have withered and dropped away, the ovaries of the female blossoms have swollen into bananas 6 to 14 inches long, and the huge bunch, containing several hundred fruits, hangs from the now withering plant, which soon dries up if left to itself. From its base spring up offshoots which may be transplanted, and if the stem is cut down as soon as the fruit is gathered, the round bulbous rootstock sends up new leaves, and a second plant matures much sooner than do the offshoots. Although most banana bunches hang down in maturity, a variety is found on the Society Islands whose very large bunches of deep orange-colored fruit stand up erect, forming ornamental rather than useful objects; for their taste even when cooked is acrid and disagreeable. The Brazilian banana is tall, rising to a height of 15 or even 20 feet, and the fruit is yellow and excellent, rather vinous in flavor. The Chinese banana seldom exceeds five feet in height, the leaves of a silver hue, and the fruit aromatic. The *fei* or Tahitian banana is similar to the Brazilian, but not so tall, and the fruit is angular, yellow, turning black when fully ripe, and the flesh is salmon-colored or buff, and slightly acid. A variety with a red skin is brought from the West Indies, and a very small banana is found in Africa and the East Indies. The botanical distinction of species is probably not well founded, as at present two, *M. sapientum* and *M. paradisiaca*, are supposed to comprise all the edible varieties; and the popular names banana and plantain are often confounded, the latter being applied to the cooking varieties. Usually no seeds are found in the pulp, but at Akyab and along the coast of Arracan a kind is common full of seeds. These seeds are black, rough, as large as cotton seeds, and like these enveloped in a fibrous coat. The Spaniards, from the fancied resemblance of the transverse section to a cross, supposed the banana to have been the forbidden fruit, and that Adam saw in eating it the mystery of redemption by the cross. Bananas are eaten raw, either alone or cut in slices and with sugar and cream or wine and orange juice. Cooked when green or ripe, they are fried alone or in butter, baked with the skins on, or made into puddings or pies. They may be cut into strips and dried, or pounded into a paste; in the latter form they are the staple food of many

Banana.

much moisture to grow in perfection), it soon sends up two leaves, tightly rolled together until the green roll has grown two or three feet, when the blades unfold. These leaves are followed by others, until the stems of the leaves have formed a smooth trunk some eight or ten inches thick, composed wholly of the concentric

rican tribes. The amount of nourishment very great, and Humboldt states that the land which produces 1,000 lbs. of potatoes will yield 44,000 lbs. of bananas; a surface ring wheat enough to feed one man will, on planted with bananas, feed 25. The young shoots are cooked as greens, but the old ones (from 6 to 10 ft. long and 12 to 14 in. in diameter) and stem are full of a watery, acrid juice, which stains white cloth an indelible black or dark brown. The fibres of the leaves make a fine fabric of great beauty, known as a fine kind of grass cloth. The plants are set closely in cultivation, and the bunches are gathered before they are quite ripe and hung up in a cold place, or better still, buried in the earth. A plantation will yield all the year round by timely planting, but the crop is much more abundant at one season. The bunches may weigh 80 or even 100 lbs. when ripe.

BANANA ISLANDS, three small islands on the west coast of Africa, 80 m. S. W. of Sierra Leone, near Cape Shilling, named after the largest, 4 m. long and 1 m. broad; lat. 8° 8' N., lon. 18° 15' W. They are high, fertile, inhabited, and separated from Sierra Leone on account of the similarity of the climate. The Rev. John Newnham, the friend of Cowper, spent some time here in the service of a slave-dealer.

BANANAL, an island in the river Araguay, province of Goyaz, Brazil, also known as Ilha Anna. It is 200 m. long by 35 broad, covered with a dense forest, and said to have in its centre a navigable lake, 90 m. long by 30 m. broad. It is very fertile, and derives its name from the increase of the banana plants introduced by its discoverer in 1778. There are several Brazilian villages of the same name.

BANAT (Hun. *Bánát*), a district governed by Hungary, a part of S. Hungary, comprising the counties of Torontál, Temes, and Krassó, and, in a wider sense, the divisions of the Military Frontier adjoining these counties, thus bounded by the Theiss, S. by the Danube, N. by the Carpathian mountains, and E. by the mountain ranges which separate Hungary from Wallachia and Transylvania; area, in the wider sense, about 10,000 sq. m.; pop. about 1,800,000, including Magyars, Germans, Wallachs, Rascians or Servians, Jews, Bulgarians, and gypsies. About one-third of the Banat is very hilly, the rest is level, and in parts swampy. The interior is well watered by the Temes, Karna, and Bega. The Bega canal, nearly 90 m. long, is within the district. The Banat, though not unfrequently visited by both droughts and inundations, is one of the most fertile regions of Europe, especially in wheat, maize, millet, tobacco, sunflower, and fruit. Excellent wine is produced in moderate quantities; game and fish are plentiful. The minerals include iron, copper, and also some gold, silver, and zinc; coal, however, is the principal mineral production. The Romans formed several settlements in the Banat, on account of the mild climate. Devastated by the Turks, it was wrested from them

in 1716 by the Austrians, who governed it for some time as a military district, Temesvár being its capital. The Banat proper was separated from Hungary in 1849 to form with the county of Bács a new Austrian crownland under the name of Voivodina or Serb waywode. The principality of Banat of Temes; but it was reunited to the kingdom in 1860. In the summer of 1872 the Banat was desolated by inundations of uncommon magnitude.

BANBURY, a market and borough town in Oxfordshire, England, on the river Cherwell, 65 m. N. W. of London; pop. in 1871, 4,100. It has a considerable trade. The manufacture of agricultural implements has become important, and the town has much improved within 20 years. The large church is an imitation of St. Paul's cathedral. Banbury tarts and Banbury cheese are famous all over England.

BANCA, an island of the Malay archipelago, between lat. 1° 30' and 3° 8' S., and lon. 105° 9' and 106° 51' E., bounded N. and E. by the China sea, S. by the Java sea, and on the W. separated from Sumatra by the strait of Banca, 135 m. long, one of the chief highways of European commerce in the eastern seas; area, about 5,000 sq. m.; pop. in 1869, 59,000, including about 23,000 Chinese and 150 Europeans. Banca is chiefly known by its inexhaustible tin mines, the annual product of which was estimated in 1872 at about 9,000,000 pounds, chiefly exported from Batavia. The digging, washing, and smelting of the alluvial tin ore are entirely in the hands of the Chinese population, who receive advances from the Dutch government, which exercises a monopoly of the produce. Of the indigenous population, about one-third are the *orang ganyang*, mountain men, savages whom the Dutch have not been able to civilize to any extent. They are scattered about in separate families, and subsist chiefly upon the spontaneous products of the forest and the meat of wild hogs. On the coast are the Sikas tribes, similar to the Bajaks or sea gypsies in habits, though differing from them in language. They dwell in boats and live by fishing and piracy. The Chinese are subjected to severe restrictions by the government, and none are allowed to remain beyond a certain period. The Chinese fleet arrives with the N. W. monsoon, with sometimes 2,000 and 3,000 coolies. They are directly governed by their *kapallars*, or captains, as in other parts of the archipelago, who are appointed by the government. The island is crossed by a chain of mountains, the highest peak of which is about 2,800 ft. high. This chain has the same direction as that of the Malay peninsula, and is of the plutonic part of Sumatra, running from N. W. to S. E., and the same geological formation. The main component of the mountains is granite, containing tin, gold, and iron. Next to the granite, and in situations of less elevation, there occurs an extensive formation of red ironstone, the laterite of geologists, and in the lowest lands an alluvial formation.

intermixed with sandstone and breccias, among which occur the washings of tin and gold. The soil of Banca is decidedly sterile. Besides tin mining, the only industry consists in the limited cultivation of rice and of a few fruits and vegetables. The whole island is covered with forests, the marshy parts being impenetrable. The most valuable products of the forest for trade are eaglewood, ebony, and chiefly beeswax. Of animals, there are two species of wild hog, the same as those of Java, which are very numerous, a stag, the pigmy deer or kanchil, and the Malayan bear. The principal port is Minto or Muntok, formerly the seat of the Dutch governor (who now resides at Banca Kota), and of a small garrison; it is situated on the shore of the safest roadstead on the straits of Banca, in lat. 2° S., lon. $105^{\circ} 5'$ E., and contains about 3,000 inhabitants, chiefly Chinese.—This island attracted no attention till the discovery of its tin in 1709. The sultan of Palembang endeavored to establish a monopoly of it; but the Dutch sent an expedition to force a treaty upon him, securing to themselves the right of preëmption at a very small price. The island was occupied by the English during the Napoleonic reign in Holland, but restored to the Dutch after the restoration of the house of Orange. The Dutch in 1818 restored the old sultan Badr-Oodin, whose treachery brought on a bloody war of two years, ending in 1821 with the triumph of the Dutch, who have since held the island.

BANCROFT, Aaron, an American clergyman, born in Reading, Mass., Nov. 10, 1755, died in Worcester, Mass., Aug. 19, 1839. He was educated in the Calvinistic system, but was subsequently led to a belief more nearly resembling that of Arminius, Grotius, and Locke. When the American revolution broke out, he often took a place in a company of "minute men," and, though then a collegian, was a volunteer at Lexington and Bunker Hill. He graduated at Harvard college, studied theology, and began at once to preach. Of the next five years of his life, three were passed in Nova Scotia. In 1785 he was settled permanently in Worcester. Besides occasional sermons, chiefly in defence of religious liberty, he printed in 1800 a eulogy on Washington, and in 1807 a life of Washington, which was reprinted in England in 1808, and has been very widely circulated in the United States. In 1822 he published a volume of doctrinal sermons, directed chiefly against the dogma of unconditional election. His protest against Calvinism long preceded the rise of the Unitarians, and though in the latter part of his life he was president of the American Unitarian association, he would never discard the name or the system of Congregationalism. He was a doctor of divinity of Harvard college.

BANCROFT, Edward, an English naturalist and physician, died in 1821. He resided long in America, where he was intimately associated with Franklin and Priestley. He wrote an

"Essay on the Natural History of Guiana" (London, 1769), which contained much information at that time new, particularly an account of the woorali, or vegetable substance employed by the Indians to poison their arrows. He also published "Experimental Researches concerning Permanent Colors, and the Best Means of Procuring them" (2 vols. 8vo, 2d ed., London, 1813), which was translated into German.

BANCROFT, George, an American historian and statesman, son of the Rev. Aaron Bancroft, born in Worcester, Mass., Oct. 3, 1800. He pursued his preparatory studies at Exeter, N. H., and in 1818 entered Harvard college, where he gave special attention to metaphysics and morals, and acquired a strong predilection for the writings of Plato. He graduated in 1817, and almost immediately started for the universities of Germany. In Göttingen, where he remained for two years, he studied under the most learned professors of the time, including Eichhorn, Heeren, and Blumenbach, with nearly all of whom he had close personal acquaintance. He applied himself to German, French, and Italian literature, the oriental languages and the interpretation of the Scriptures, ecclesiastical and other ancient history, natural history, the antiquities and literature of Greece and Rome, besides pursuing a thorough course of Greek philosophy. He selected history as his special branch of study. Having received at Göttingen in 1820 the degree of doctor of philosophy, he repaired to Berlin, where he continued his studies, and became intimate with Schleiermacher, Wilhelm von Humboldt, Savigny, Lappenberg, Varnhagen von Ense, and other distinguished literary persons. He also carefully observed the administration of the Prussian government in many of its departments. In the spring of 1821 he began a journey through Germany and other parts of Europe. He had already in a Göttingen vacation seen Dresden, and had made the acquaintance of Goethe at Jena. At Heidelberg he spent some time in study with the historian Schlosser. In Paris he became acquainted with Cousin, Alexander von Humboldt, and Benjamin Constant. He passed a month in England, travelled on foot through Switzerland, and spent eight months in Italy, forming an acquaintance with Manzoni at Milan, and a friendship with Chevalier Bunsen at Rome, where he also knew Niebuhr. In 1822 he returned to America, and accepted for one year the office of tutor of Greek in Harvard university. During this year he preached several sermons, yet he seems not long to have entertained the thought of entering the clerical profession. In 1823, in conjunction with Dr. Joseph G. Cogswell, he established the Round Hill school at Northampton. He published at this time his translation of Heeren's "Politics of Ancient Greece," and a small volume of poems, and he was also busily meditating and collecting materials for a history of the United States. In 1826 he delivered at Northampton an oration, in which he avowed

a principles to be for universal suffrage and uncompromising democracy. He was elected in 1830, without his knowledge, to the legislature of Massachusetts, but refused to take his seat, and the year after he declined a nomination, though certain to have been elected, for a senate of his state. In 1834 appeared the first volume of his "History of the United States." In 1835 he drafted an address to the people of Massachusetts, at the request of the young men's democratic convention, and was for a time actively engaged in political speaking, and in drawing up resolutions and addresses. He removed in this year to Springfield, where he resided three years, and completed the second volume of his history. In 1838 he was appointed by President Van Buren director of Boston. Duties were at that time paid by bonds, and unpaid bonds had accumulated to a large amount as debts to the government; but not a single bond taken during the term of Mr. Bancroft was unpaid at the time when he resigned the office, and his collections amounted to several millions. He was at this period a frequent orator in political assemblies, and pursuing his studies zealously, and was particularly interested in the philosophical movement subsequently known as transcendentalism. In 1840 the third volume of his history was published. In 1844 he was nominated by the democratic party for governor of Massachusetts, and, though not elected, received more votes than any candidate has received either before or since on the purely democratic ticket. During the canvass he was in the city of New York, studying manuscripts and documents illustrative of our early history. After the accession of Mr. Polk to the presidency in 1845, Mr. Bancroft entered the cabinet as secretary of the navy. He signalized his administration of this office by the establishment of a naval academy at Annapolis. The improvement of education in the navy had been desired by some of his predecessors, but little had been done to promote it, and Mr. Bancroft was the first to design a school for the naval service, corresponding to the military school at West Point. At his request the secretary of war, with the approval of the president, made over to the navy department the military fort grounds at Annapolis, and the school was once set at work by Mr. Bancroft, who received for the purpose all the appropriations which he asked. He was also influential in obtaining additional appropriations for the Washington observatory, and in introducing some new professors of great merit into the ranks of instructors. A reform in the system of promotion in the naval service being required by many, he planned a method by which promotion should depend not on age alone, but also on experience and capacity; but his scheme was never fully developed or applied. While secretary of the navy Mr. Bancroft gave the order to take possession of California, and was carried into effect before he left the

naval department. During his term of office he also acted as secretary of war *pro tem.* for a month, and gave the order to Gen. Taylor to march into Texas, which caused the first occupation of Texas by the United States. In 1846 Mr. Bancroft exchanged his position in the cabinet for the office of minister plenipotentiary to Great Britain. He successfully urged upon the British ministry the adoption of more liberal laws of navigation. The arrest of some Irish Americans gave him an opportunity also to vindicate the rights of naturalized American citizens; and at his demand they were set free. During his residence in England he made many friends among the men of letters of that country. In 1849 the university of Oxford made him a doctor of civil law, and he had before been chosen correspondent of the royal academy of Berlin, and also of the French institute. He used the opportunity of his residence in Europe to perfect his collections on American history. He made several visits to Paris, to study the archives and libraries of that city, being aided in his researches by Guizot, Mignet, Lamartine, and De Tocqueville. In England the ministry opened to him the records of the state paper office, embracing a vast array of military and civil correspondence, and also the records of the treasury. In the British museum, also, and in private collections, he found valuable manuscripts. He returned to the United States in 1849, took up his residence in New York, and began to prepare for the press the fourth and fifth volumes of his history, which were published in 1852. The sixth volume was issued in 1854, the seventh in 1856, and the eighth soon after. Up to 1866 he declined any public office, though several were tendered him, and resided in New York, engaged in literary labor. In February of that year, at the request of Congress, he delivered an address in memory of Abraham Lincoln. The ninth volume of his history also appeared during that year. On May 14, 1867, he was appointed minister to Prussia, and accepted the office, in 1868 he was accredited to the North German confederation, and in 1871 to the German empire. Under his auspices, important treaties concerning the naturalization of Germans in America were concluded with the various states of the confederation in February, 1868. In August of the same year Mr. Bancroft received from the university of Bonn the honorary degree of Doctor Juris, and in September, 1870, he celebrated the 50th anniversary of receiving his first degree at Göttingen. On this occasion he was congratulated by many German societies and faculties, as well as by prominent men of several nations. He still gives much of his time to labor on his unfinished "History of the United States," and has the tenth and last volume nearly ready for the press (1878). Mr. Bancroft is a member of many American and foreign learned societies. Besides the works mentioned above, he has published numerous essays in the "North

American Review" and other periodicals, a collection of which has been made under the title of "Miscellanies" (New York, 1855). Mr. Bancroft's "History of the United States" occupies a very prominent place not only in the historical literature of his own country, but in that of the world, since it is everywhere a recognized authority concerning the period which it covers. It is not merely a narrative, but a philosophic treatise, dealing with causes and principles as well as events, and tracing with remarkable skill the progress of enlightenment and liberal ideas. It has been translated into various languages, and is especially popular in Germany.

BANCROFT, Richard, an English prelate, born at Farnworth in September, 1544, died in London, Nov. 2, 1610. He was chaplain to Sir Christopher Hatton, and afterward to Archbishop Whitgift, through whose and Lord Burleigh's influence Elizabeth nominated him in 1597 bishop of London. The queen employed him in 1600 on a diplomatic mission to Germany, and he attended on her deathbed. James I. promoted him in 1604 to the archbishopric of Canterbury. For nearly a generation he preached against popery; took a prominent part in the disputation before James at Hampton Court between the church of England and the Presbyterian or Puritan party, the measures of the government being afterward formed according to his views; became one of the commissioners for regulating the affairs of the established church and repressing the publication of obnoxious works; and was a member of the privy council, and shortly before his death chancellor of Oxford. He published in 1593 "Dangerous Positions and Proceedings, published and practised within this Island of Brytaine, under Pretence of Reformation, and for the Presbyterian Discipline," and "A Survey of the pretended Holy Discipline."

BANDA ISLANDS, a cluster of ten small islands belonging to Holland, in the Molucca group of the Eastern archipelago, in the Banda sea, about 50 m. S. of Ceram, between lat. 8° 50' and 4° 30' S., and lon. 128° 30' and 130° E.; area, about 130 sq. m.; pop. about 6,000, including Papua negroes, Chinese, and Dutch. About 800 of the natives are Christians. Lontar, or Great Banda, the largest of the group, is about 12 m. long and 2½ m. wide. It is almost uninhabitable on account of unhealthiness. Neira, or Banda Neira, 120 m. E. S. E. of Amboyna, is the seat of the Dutch authorities, and contains the forts Nassau and Voorzigtigheid, and the old castle Belgica, a good harbor, and extensive stores. The Gonong Api or Fire mountains, N. of Banda Neira, derive their name from the volcanic cone Api (fire), about 2,000 ft. high, which constantly emits smoke and sometimes cinders and ashes. There have been many disastrous eruptions, and in 1852 an earthquake caused great loss of life and property, and obliged the inhabitants to seek refuge in Amboyna. The chief value of the islands is

for the production of nutmegs. The plantations, which cannot be divided or sold, were worked by slaves until the proclamation of emancipation, Jan. 1, 1860, since which time they have been cultivated partly by Java convicts. The number of persons employed exceeds 2,500, and the trade is virtually monopolized by the Dutch East India company. The annual average production is estimated at 700,000 lbs. of nutmegs and 180,000 lbs. of mace. Sago and cacao are also produced.—The islands were discovered in 1512 by Antonio Abreu, a Portuguese, whose countrymen seized them in 1524, but were expelled in 1600 by the Dutch. Shortly afterward the Dutch ordered the wholesale execution of the indigenous Malay settlers for the murder of Admiral Verhoeven and 45 naval officers. The English conquered them March 8, 1796, restored them to the Netherlands after the peace of Amiens in 1801, and reoccupied them from 1810 to 1814; but the final restoration to the Dutch authorities was delayed till 1817, owing to a difference respecting the partition of the expenditures which had accrued in the interval.

BANDA ORIENTAL. See URUGUAY.

BANDARRA, Gonzalo Annes, surnamed the Portuguese Nostradamus, born at Trancoso, province of Beira, died in Lisbon in 1556. He was a cobbler, addicted to improvising religious verses and prophecies, and was in 1541 persecuted by the inquisition, but allowed to return to his trade. A clandestine edition of what purported to be his improvisations (*Trovas redondilhas*) was printed in 1581; this has been regarded as spurious, and a rival edition appeared in Paris in 1608. A Portuguese missionary in Brazil, Antonio Vileira, was visited with severe punishment by the inquisition for predicting the resurrection and triumphant reign of John IV., in accordance with Bandarra's prophecies of a fifth empire of the world. This led to new editions of the predictions, especially one issued in Nantes, and they have been associated with the sect of the Sebastianists, who had many followers at the time of the French invasion, and who from a mystical interpretation of these prophecies predicted the return of King Sebastian to the throne for 1808. Bandarra having been altogether illiterate, the work ascribed to him must have been penned by another hand. Writers of the 17th century called him the holy cobbler (*o sapateiro santo*).

BANDEL, Joseph Ernst von, a German sculptor, born at Anspach, May 17, 1800. He studied at Nuremberg, Munich, and Rome, and is best known for his colossal national monument of the German hero Arminius, on the summit of the Grotenberg, near Detmold. The statue is of copper, 95 feet high. The work was begun in 1838, and suspended for want of funds, after a Gothic temple had been erected for the pedestal, and the statue itself had been made in detached pieces. An association was formed in 1862 for the collection of subscriptions. The king of Prussia in 1869 contributed 2,000 tha-

but more money is required for the completion of the work. In the delicacy and elegance of his works in marble, Bandel is hardly prior to Canova. Among his best works are statues of Shakespeare and Goldoni for the opera theatre.

BANDELLO, Matteo, an Italian novelist, born Castelnovo Scrivia, near Alessandria, in 1600, died in Agen, France, about 1669. He was Dominican, accompanied his uncle, general of this order, on his travels in Italy, and was cher in Milan of Lucrezia Gonzaga, whom he celebrated in his *Canti della lode della S. crezia Gonzaga* (Agen, 1645). In 1625, siding with the French, he had to fly from Milan, and found an asylum with Cesare Sforza, an Italian general in the French service, after whose death he remained an inmate of his family at Agen. Appointed in 1650 by the king of France bishop of Agen, he accepted it of the emolument of this office, its duties being discharged by the bishop of Grasse, while he prepared for publication his *Novelle*, or tales, MSS. of which had been recovered by his friends from the incendiaries of his Milanese residence. They were used by Shakespeare in *Romeo and Juliet*, "Twelfth Night," and *Much Ado about Nothing*; by Massinger in *"Picture"*; and by Beaumont and Fletcher in *"The Maid of the Mill"* and *"The Triumph of Death."* He translated the *Hecuba* of Euripides, and wrote poetry (*Rime*, Turin, 1816); his fame rests on his *Novelle*, published in Lucca in 8 vols., 1554 (4th vol., Lyons, 1578); the complete editions are those of London (4 vols., 1740; 9 vols., 1791-'3) and Milan (9 vols., 18-'14). The most recent Italian edition is that of Turin (4 vols., 1858).

BANDERA, a S. W. county of Texas, watered by the Rio Medina; area, 938 sq. m.; pop. in '0, 649, of whom 18 were colored. Stock raising is the principal industry. Sheep and cattle are easily raised, and hogs thrive on the soil, which is abundant. The chief products in 1870 were 15,678 bushels of Indian corn, 5,530 lbs. of wool, and 9,095 of butter. There were 281 horses, 898 milch cows, 5,108 other cattle, 3,208 sheep, and 856 swine. Capital, Bandera City.

BANDETTINI, Teresa, an Italian poetess, born in Lucca, Aug. 12, 1763, died April 5, 1837. She was at first a ballet dancer, but soon left the stage and acquired celebrity as an improvisatrice. In 1789 she married Signor Pier Landucci, a gentleman of Lucca. Great honors were showered upon her in Rome and other cities by the people as well as by poets and academies; and she was equally admired for her accomplishments and virtues. Her works include *Rime diverse* (1788); *La Morte di Lucrezia*, a poem in four cantos; and *Il Polidoro*. She was versed in several languages, and translated from the Latin and Greek with ease.

BANDICOOT (*perameles*), a marsupial animal of small size, inhabiting the stony regions of the interior of S. E. Australia. Its appearance

is somewhat rat-like, and in its long snout shrew-like. The teeth are sharp and numerous, the incisors being 5 above and 3 below, the canines 1, the premolars 3, and the molars 4, on each side in each jaw. The head is elongated, the back arched, and the mode of progression, from the union of the 2d and 3d toes of the hind feet, the smallness of the hind thumb and outer fore toe, and separation from the others, consists of a gait between a jump and a run; the marsupial pouch opens backward. The most common species, the banded bandicoot (*P. fasciata*), is about 18 inches long, of a blackish yellow color, banded on the hinder parts; it runs with great speed, lives upon roots, seeds, insects, and grubs, and its flesh is esteemed by the natives. The long-nosed bandicoot has, as its name imports, a longer and sharper snout, and a harsh fur of a brownish and blackish color above and white below; the body is 18 inches long and the tail 5. It prefers vegetable food, and is sometimes

Banded Bandicoot (*Perameles fasciata*).

destructive in the gardens of the colonists, its long and powerful claws enabling it to dig up roots with great facility. The bandicoots make a nest of dried grass and leaves, carefully concealed at the foot of a dense bush.—The *chaeropus*, an allied animal of New South Wales, has two toes of equal length on the fore feet, with sharp hoof-like claws resembling those of a pig; the tail is long and rat-like. It is a slender, graceful animal, with very large ears; it is of the size of a small rabbit, and its fur is very soft; its speed is considerable, and it eats both vegetable substances and insects.

BANDIERA, Attilio and Emilio, Italian patriots, born respectively in 1817 and 1819, executed at Cosenza, July 25, 1844. They were lieutenants in the Austrian navy, and were the sons of an Austrian vice admiral of a noble Venetian family. Joining the conspiracy for Italian freedom, they took refuge in Corfu in March, 1844, whence with 20 others they effected a landing in Calabria June 16; but being betrayed by one of their number, they fell into the hands of the Neapolitan forces near San Giovanni in Fiore. The two brothers were summarily executed. Their patriotism and heroic spirit created a strong sympathy in their favor in England, where Sir James Graham,

then postmaster general, was severely censured for his supposed share in their fate by opening and disclosing their correspondence with Mazzini. In France, Deschamps and Louise Collet wrote poetry in their honor, and in Italy, Mazzini's work on their martyrdom had a wide circulation, as well as Ricciardi's *Storia dei fratelli B. e consorti* (Florence, 1863).

BANDINELLI, Baccio, an Italian sculptor, born in Florence in 1487, died there in 1559. He was the son of an eminent goldsmith, studied sculpture and painting, and eventually devoted himself exclusively to the former art. Among his best works are a statue of Orpheus, copied from the Apollo Belvedere; a group of Adam and Eve; a copy of the famous group of the Laocoön, in regard of which he boasted of having surpassed the original, which gave rise to Michel Angelo's remark, *Chi va dietro ad alcuno, non può mai passare inanzi*, "He who follows another, can never pass before him;" the "Descent from the Cross," the "Martyrdom of St. Lawrence," the "Massacre of the Innocents," and the colossal Hercules and Cacus, besides many fine bass-reliefs. His works display a great knowledge of anatomy and much fertility of imagination, but are deficient in grace and elasticity. He was of an envious nature, and was charged with having destroyed one of Michel Angelo's celebrated cartoons. He was patronized by the popes and by Charles V., and left a large fortune.

BANDON. I. A river in the county Cork, Ireland, rises in the Carberry mountains, near Dunmanway, and after an E., N. E., and S. E. course of 40 m. enters the Atlantic, forming Kinsale harbor. It is navigable for vessels of 200 tons to Innishannon, 10 m. inland. II. Or **Banden-bridge**, a town of Ireland, county Cork, situated on both sides of the Bandon, 15 m. S. W. of Cork; pop. in 1871, 6,074. It is well built of stone, has several schools, and was once a prosperous manufacturing town.

BANDTKE, or Bandtkie. I. Jerzy Samuel, a Polish historian, born in Lublin, Nov. 24, 1768, died in Cracow, June 11, 1835. He was educated in Germany, was a private tutor in St. Petersburg, teacher and rector at Breslau, and librarian and professor in the university of Cracow. He wrote a Polish-German dictionary and grammar, a history of printing in Cracow and in Poland, and other works, the principal of which is his *Dzieje narodu polskiego* ("History of the Polish Nation," 3d ed., 2 vols., Breslau, 1835). II. Jan Wincenty, brother of the preceding, born in Lublin in 1783, died in Warsaw in 1851. He was for over 20 years professor of jurisprudence at the university of Warsaw, and published editions of the *Jus Culmense* (Warsaw, 1814), and the *Jus Polonicum* (Breslau, 1831), and a history of Polish law (*Historia prawa polskiego*, Warsaw, 1850).

BANER, Johan, a Swedish general, born near Stockholm, June 23, 1595, died in Halberstadt, May 10, 1641. His father, one of the councillors of Charles IX., gave that king some of-

fence, and was executed at Linköping in 1600. Under Gustavus Adolphus the son took an active part in the conflicts with Russia and Poland, and in the thirty years' war, distinguished himself at Leipsic (1631), where he defeated the right wing of the imperialists under Pappenheim, contributed toward the conquest of Augsburg and Munich, became commander of an important section of the Swedish army, and succeeded in conjunction with Horn in expelling Aldringer from Bavaria. After the death of Gustavus Adolphus he was invested by Oxenstierna with the supreme command of the army. He won a brilliant victory at Wittstock, Sept. 24, 1636, and a still more decisive triumph at Chemnitz in 1639, after which he overran and devastated the whole of Germany, his harsh and overbearing nature intensifying the calamities of the war. His attempt in 1641 to seize the emperor and diet at Ratisbon was frustrated by the difficulty of crossing the Danube. He was overtaken by illness on his return from the expedition, and his death was attributed by some to poison and by others to his licentious and intemperate habits. He had few superiors in reckless daring and gallantry in the field. The king of France called him his cousin, and the emperor endeavored in vain to secure his services by offering him a princely title with Wallenstein's estates as a fief.

BANFF, or Bamff, a parliamentary borough, seaport, and the chief town of Banffshire, Scotland, on the left bank of the Deveron (crossed by a fine stone bridge of seven arches), near the entrance of that river into the Moray frith, 117 m. N. of Edinburgh, and 38 m. N. W. of Aberdeen; pop. in 1871, 7,439. It is a fine town, and has been a royal burgh since the end of the 14th century; thread, linen, hosiery, soap, and leather are manufactured. Herring, cod, and salmon fisheries are active, the salmon being sent to London, packed in ice. Corn and cattle are likewise exported. There are about 100 registered vessels.

BANFFSHIRE, or Bamf, a county in the N. of Scotland, bordering on Moray frith; area, 686 sq. m.; pop. in 1871, 62,010. The surface, more than half of which is uncultivated, is mountainous except near the coast; Ben Mac Dhui (4,362 ft. high) and Cairngorm (4,060 ft.) lie partly within the county. The rivers Avon and Spey form portions of the western boundary, and the Deveron part of the eastern. The lowlands are fertile; cattle-breeding is the principal industry. Many of the inhabitants are engaged in fishing, weaving, bleaching, flax-dressing, tanning, and distilling. Cairns or tumuli are found in the county.

BANG, or Banj, a narcotic made of the leaf of a kind of hemp (*cannabis Indica*), used by the orientals as a means of intoxication. It is generally chewed. It is also sometimes given with tobacco, or in coffee or other drinks, and is used to drug persons with.

BANGALORE, a fortified city of southern India, in the state of Mysore, 175 m. W. of Ma-

ras: pop. in 1867 estimated 140,000, mostly Hindoos. It was founded by Hyder Ali, under whom it rose rapidly. Lord Cornwallis took it by assault in 1791, and after the English withdrew Tippoo Saib partially dismantled the citadel and drove away the wealthy merchants by his heavy exactions. On the death of Tippoo the territory, though ruled by a native sovereign, came under British protection, and revived rapidly. The town has considerable trade with all parts of S. India in salt, sugar, pices, metals, dyestuffs, silk, cotton, and wool. Silk and cotton tissues are woven for home consumption. The town is on an elevated site, and is a place of resort for invalids.

BANGKOK, the capital of the kingdom of Siam, situated on the river Menam, about 20 m. from its mouth, in lat. $13^{\circ} 58' N.$, lon. $100^{\circ} 4' E.$; pop. about 500,000, more than one third of whom are Chinese, 120,000 Siamese, and the rest Malaya, Burmese, Arabs, and Hindoos. The Menam is here about 1,800 ft. wide, and sufficiently deep for vessels of large size. When the capital was first established at Bangkok the houses were built on the banks of the river; but so frequent were the invasions of cholera that one of the kings commanded his people to build on the river itself for the purposes of better ventilation and drainage. The privilege of building on the banks now is reserved to the members of the royal family, the nobility, and persons of political influence. A double and sometimes a triple row of floating houses extends for miles on the river. These are wooden structures built on rafts of bamboo linked together with chains, which are made fast to piles planted in the bed of the stream. The stores are situated together with the houses or form parts of them, and every house has a canoe attached to it. Some of the prisons are grated and hung like bird cages over the water, and in those on land the prisoners are chained together in gangs. In Bangkok there are 20,000 priests supported by the voluntary contributions of the public. There are also American and Roman Catholic missions here. On the land the pagodas and the *stupa-chak-dae* or minarets that crown some of the temples are elaborately ornamented with mosaics of fine porcelain inlaid with ivory, gold, and silver, while the doors and windows are overlaid with sculptures of grotesque figures from the Buddhist and Brahminical mythology. Near the grand palace are three high columns of elegant design inlaid all over with variegated stones, and very richly gilt. These monuments mark the graves of several kings of Siam. The royal palace is a citadel surrounded by triple walls and fortified with bastions. Each of the separate buildings is cruciform, and the new palace forms with the old one the arms of a cross. On one side of the palace are the temples and monasteries dedicated to the sleeping idol, and on the other the palace and harem of the second king. The sleeping idol is a reclining figure 150 ft. long

and 40 ft. high, entirely overlaid with plate gold, and the soles of its feet covered with bas-reliefs inlaid with mother-of-pearl and chased with gold, each separate design representing one of the many transmutations of Buddha. Near this temple is the palace of the white elephant, and further on the temple of the emerald idol. The latter is a remarkable and beautiful structure, with Gothic doors and windows richly ornamented with gold, and the roof supported by lofty octagonal columns, the ceiling covered with mythological symbols and figures, the altar is a pyramid 100 ft. high terminating in a fine spire of gold. The emerald idol is about 12 inches high and 8 in width. The gold of which its hair and collar are composed is mixed with crystals, topaz, sapphires, diamonds, and other precious stones. Three miles below the capital are the royal dockyard under the supervision of English shipwrights. The heat in the summer months is intense. Trade is mostly carried on by water. The principal articles of commerce are lac, ivory, rice, cotton, opium, silk and silk stuffs, sugar, guava, birds' nests, mungo, dainties, coffee, coconuts, black pepper, hides, horses, tobacco, ginseng, tea, tin, sandal, rosewood, and eagle wood. There are numerous factories of iron, and leather. The foreign trade is nearly monopolized by the government. The value of the exports in 1869 was \$5,906,880, of which \$2,276,860 was carried in Siamese and the rest in foreign vessels. The invoice value of cargo imported was \$3,759,850, of which \$2,722,700 was carried in Siamese vessels. The country surrounding Bangkok contains rich iron mines and extensive forests of teak.

BANGOR, a city, seat of justice of Penobscot county, Maine, and a port of entry, on the west bank of the Penobscot river, at its junction with the Kenduskeag, about 55 m. from the ocean and 60 m. N. E. of Augusta; pop. in 1860, 16,407; in 1870, 16,289. It has a small and capacious harbor, accessible at the highest tides, which rise 17 feet, to the largest vessels. The city is situated on both banks of the Kenduskeag, connected by a fine stone bridge toward which the principal streets converge. There is also a bridge 1,890 ft. long across the Penobscot, connecting Bangor with Brewer. Many of the streets are broad and well shaded with elm trees. The chief public building is the custom house, a handsome granite structure which cost \$100,000. Bangor is, next to Chicago, the greatest depot of lumber on the continent, 200,000,000 feet being frequently received in a year. The head waters of the Penobscot traverse immense forests of pine, spruce, and hemlock. The cutting and hauling of this timber to the river in the winter, driving it down, booming, sawing, and rafting it, and loading it on vessels in the harbor, give employment to a large number of men. About 2,000 vessels are annually engaged in this trade, during the eight or nine months in which the river is free from ice. The city is also the centre of

fine agricultural district. The Bangor theological seminary (Trinitarian Congregational), originally established in 1816 at Hampden, 6 m. below the city, occupies an elevated position, overlooking the city and the Penobscot river. In 1870 it had 4 professors, 24 students, a library of 18,000 volumes, and an endowment of \$120,000. There are 17 churches (7 Congregational, 2 Baptist, 2 Methodist, 1 Free-will Baptist, 1 Universalist, 1 Unitarian, 1 Episcopal, 1 Catholic, and 1 Second Advent), 53 public schools, 6 national banks, 3 state banks, 2 savings banks, and 1 daily and 1 weekly newspaper. The Bangor library association, founded in 1848, has 11,000 volumes. The value of real and personal estate in 1860 was \$6,015,601, and in 1870, \$9,851,561. The city is connected with Portland, Boston, and other points on the coast by two lines of steamers. By a branch of the Maine Central railroad it has railroad connection with Waterville, Belfast, Augusta, Bath, Portland, &c. The European and North American railway is to form the only all-rail route between Bangor (where it connects with the Maine Central railroad) and St. John, New Brunswick, a distance of 200 m. The imports for the year ending June 30, 1871, amounted to \$51,094, and the exports to \$163,885. The clearances for foreign ports were 29 American vessels, of 5,777 tons, and 56 foreign, of 6,232 tons; entrances, 4 American vessels, of 1,089 tons, and 47 foreign, of 4,414 tons. In the coast trade 284 vessels, with an aggregate tonnage of 190,237 and 6,216 men, entered, and 22 vessels of 8,618 tons cleared. The number of vessels registered, enrolled, and licensed was 192, with an aggregate tonnage of 26,659; and there were 9 vessels, of 526 tons, engaged in the cod and mackerel fishery.—Bangor was incorporated as a town in 1791, and as a city in 1834. It was named by the Rev. Seth Noble from the tune "Bangor."

BANGOR. I. A city and parliamentary borough of Carnarvonshire, Wales, situated at the head of Beaumaris bay on the Menai strait, 2½ m. from the Britannia bridge, and 9 m. N. E. of Carnarvon; pop. of the city in 1871, 6,738. It exports slates, and is much resorted to for sea bathing. A cathedral of the 15th and 16th centuries, occupying the site of a church supposed to have been built in the 6th century, a free school founded in the time of Elizabeth, and an episcopal palace, are its most interesting buildings. II. A seaport town of Ireland, county Down, on Belfast Lough, 12 m. E. N. E. of Belfast; pop. in 1871, 2,525. It has fisheries, and is a place of resort for bathing. It was the seat of a famous monastery supposed to have been destroyed by the Danes in the 9th century.

BANGES, Nathan, D. D., an American clergyman, born at Stratford, Conn., May 2, 1778, died May 3, 1862. He entered the itinerant ministry of the Methodist Episcopal church in 1801. After seven years of labor in the Canadian provinces, and a term of ministerial ser-

vice in the Albany district, he was appointed to the city of New York in 1810. He was elected in 1820 agent of the Methodist book concern, and editor of the books published by this house. After an official term of eight years, he was chosen editor of the "Christian Advocate and Journal." In 1829 he was elected bishop of the Methodist Episcopal church in Canada, but declined the appointment. From 1832 to 1836 he was editor of the "Methodist Magazine" and "Quarterly Review," having also been continued in the editorial supervision of the books published by the book concern since 1820. From 1836 to 1841 he was secretary of the Methodist missionary society, and then became president of the Wesleyan university, at Middletown, Conn. Resigning this office, he returned to the regular pastoral work, and remained a member of the New York conference to the time of his death. Dr. Bangs was the author of numerous controversial works, among which are "The Errors of Hopkinsianism," "Predestination Examined," "Reformer Reformed," "Life of Arminius," &c. He also wrote the "Life of the Rev. Freeborn Garrettson," "History of Missions," "Original Church of Christ," "Letters on Sanctification," and a "History of the Methodist Episcopal Church" (4 vols. 12mo), a standard work.

BANIALUKA, a fortified town of Turkey in Europe, in the province of Bosnia, on the left bank of the Verbas, 90 m. N.W. of Bosna-Serai; pop. about 15,000. It contains 40 mosques, several colleges, public baths, a cathedral, and a powder mill.

BANIAN, or *Banyan* (*Ficus religiosa* or *Indica*), a fig tree of the East Indies, remarkable for its manner of growth and longevity. The fruit is red and not much larger than a pea, and the seeds are minute, but covered with a hard testa which protects them from the digestive organs of the birds who seek the fig as food. The birds plant the seeds in crevices of stones or buildings, or on trees, and with the necessary moisture they germinate in these places, sending their roots into and widening the chinks, or down the moist bark of the tree on which the seed has been dropped, and the plant grows rapidly into a broad, spreading, although not very lofty tree, whose horizontal branches send down roots as slender fibres until they reach the earth, when the growth is reversed and the depending rootlet becomes an ascending trunk equalling or even surpassing the parent stem. A famous banian stood on the banks of the Nerbudda which could shelter 7,000 men, and others cover more than 13 acres. They are frequently found near temples and on the mounds where the Hindoo widows have performed suttee, as the birds are attracted to these places. The figs, although small, are abundant, insipid in taste, and of mild medicinal properties. The leaves are of a bright green and form a dense shade, effectually preventing the growth of underbrush. They are about five inches in length and four

Banian Tree.

in width, and are downy on both sides when young, becoming smooth and brilliant as they grow. The Brahmins use the leaves as plates and dishes. The bark is supposed by the Hindoos to be a powerful tonic; and they use the white gum of the tree as a cure for the tooth-ache, or apply it as a healing plaster to the feet when chafed or bruised. Bird-line is also made from this gum. The wood of the tree is porous and almost useless.

BANIM. I. John, an Irish novelist, born in Kilkenny, April 3, 1798, died near Kilkenny, Aug. 1, 1842. In his youth he went to Dublin and afterward to London to seek literary employment, was befriended by Shiel, and in his 24th year won a brilliant success by his tragedy of "Damon and Pythias," played by Macready and Kemble at Covent Garden. Soon afterward he began with his brother Michael a series of novels illustrative of Irish life, which appeared in 1825 under the title of "Tales by the O'Hara Family," and were followed in 1826 by a second series, "The Bit o' Writin'," "Boyne Water," "The Denounced," "The Nowlans," "The Smuggler," and other stories appeared at short intervals, and nearly all became very popular. Banim died in poverty, and in his latter years was supported chiefly by a pension from the government. II. Michael, brother of the preceding, born in August, 1796. He assisted his brother in the "Tales by the O'Hara Family," and is the author of "The Croppy," "Father Connell," "Crohoore of Bill-hook," "The Ghost-hunter," "The Mayor of Wind Gap," &c.

BANISTER, or **Halifax Court House,** a post village of Halifax co., Virginia, on the Banister river, 10 m. above its confluence with the Dan, and 120 m. by rail S.W. of Richmond; pop. in

1870, 3,731. The Richmond and Danville road passes through it, and the river is navigable for bateaux from its mouth to Meads, 10 m. above Banister. Six miles from the place there is a plumbago mine.

BANJERMASSIN, or **Banjarmassin.** I. A state of S. E. Borneo, governed by a sultan subordinate to the Dutch government; vaguely estimated at about 300,000, nearly all Mohammedans. It borders on the strait of Macassar, and is bounded W. by the Barito river. A range of mountains, some of them 3,000 ft. high, runs through the district. Diamonds, and excellent coal are found, the natives are noted for their skill in making all kinds of arms. Pepper is the most important product of the soil. The trade is controlled by the Chinese. The Dutch seized here in 1747, and in 1787 made a treaty with the sultan by which their supremacy was recognized in consideration of their aid in repelling an invasion from Celebes. The British East India company seized Banjarmassin in 1811, but restored it in 1817. II. The capital town of the preceding state, and capital of the Dutch residency of the S. and E. coast, situated on the left bank of the river Banjer, about 15 m. from its mouth in the Java sea; lat. 23° S., lon. 114° 37' E.; pop. about 15,000. The houses are raised on piles, the site being frequently inundated, and most of the traffic is carried on in boats. There is a fort, which encloses the Dutch resident's house, barracks, &c. Pepper, benzoin, bezoar, rattans, iron, birds' nests are exported. The imports include rice, salt, sugar, opium, gunpowder, silk, &c.

BANJO (corrupted from *bandora*, a species of guitar), a musical stringed instrument now esteemed by the negroes of the south.

United States. Its capacity is limited to the performance of simple tunes, and it is purely an instrument of accompaniment. Its head and neck are shaped like the guitar, while the body is a circular frame like the head of a drum, over which parchment is stretched in place of a sounding board. Five strings, of which the fifth is shorter than the others, pass over this parchment, and are played with the fingers.

BANK, in trade and business, a place of deposit for money. In nearly all languages the words for bank and banker are derived from those meaning table, bench, or counter: *τραπεζίτης* among the Greeks, *mensarius* among the Romans, and *banchiero* among the Italians of the middle ages. The banker was originally a changer, and he stood in the market place and furnished such different kinds of money as were demanded. By degrees he took funds on deposit, made advances upon securities, merchandise, pledges, titles to property, family papers, &c., and became finally what we now know as a banker. The lending of money with the taking of interest for its use is a custom which dates from the earliest antiquity of which there are records. Constant reference is made to it in both the Old and the New Testament. In ancient Greece the business of receiving money on deposit and lending it out was an important one, and the money changer stood high in credit and in the confidence of both the government and the people of Athens. The state bank of New Ilum, of the precise nature of which we are not informed, in the second century before Christ, borrowed money for the state, and paid for its use 10 per cent.—Banks are designed to afford safe places of deposit for the money of individuals, corporations, or governments; for facilitating the exchange of money from the hands of parties who have payments to make to those of such persons as are to receive them, thus becoming clearing houses for the communities in the midst of which they are situated; and for extending aid to business by granting loans or discounts on notes, bonds, stocks, or other securities. These institutions are of three kinds, and may be classed as follows: Banks of deposit receive on deposit the money of individuals, corporations, or governments, and hold it subject to the draft of its owner or owners, or under such other agreement as may be entered into. Banks of discount furnish loans upon drafts, promissory notes, bonds, or other securities. Banks of circulation pay out their own notes, which may or may not, according to circumstances, be payable in coin on demand. Banks which exercise the last of these functions generally unite the first and second.—The bank of Venice, the first establishment of the kind in Europe, was founded in 1171, and owed its existence to wars and the necessity for the government obtaining the means for conducting them. Having exhausted every other resource, the state was obliged to resort to a

forced loan from its most opulent citizens. Then was organized the chamber of loans, which by degrees assumed the form under which, as the bank of Venice, "it was for many ages the admiration of Europe, the chief instrument of Venetian finance, and the chief facility of a commerce not surpassed by that of any European nation." Funds once deposited in the bank could not be withdrawn, but were transferable at the pleasure of their owners upon its books. So thoroughly did the bank credits become the means through and by which the financial operations of the people were conducted, that during its entire existence, with but slight exceptions, these credits were at a premium over coins, which latter were clipped and worn, as well as of various countries and uncertain values. That the people were well satisfied with this institution and its workings may be inferred from the fact that "no book, speech, nor pamphlet have we found," says an eminent economical writer, "in which any merchant or dweller in Venice ever put forth any condemnation of its theory or its practice." The bank of Venice continued in existence without interruption until the overthrow of the republic in 1797, by the revolutionary army of France.—The bank of Genoa was projected in the year 1845, but did not go into full operation till 1807. It was for centuries one of the principal institutions of its class in Europe. Within a space of less than 60 years—first in 1746, and again in 1800—it was twice pillaged by a foreign foe, in the latter instance by the French army under Masséna. From the effects of this disaster it has never recovered, and it has ceased to perform the functions of a bank.—The bank of Barcelona was established in the year 1401, that city having been during the middle ages one of the most enterprising and flourishing of the trading cities of Europe. Here it was that the system of negotiation of bills of exchange was first instituted.—The bank of Amsterdam was founded in the year 1609, Holland being then possessed of an important foreign trade. It was a bank of deposit only, and the money in its possession was transferred on the books of the institution at the pleasure of its owner or owners. The primary object of the establishment of the bank was to give a standard or certain value to bills which might be drawn upon Amsterdam—rendered necessary by the depreciation of the coins, owing to their having been worn or clipped. Here these coins were received on deposit, and had their value established by weight and fineness. It was not the design on founding the institution that the funds should at any time be lent out, but should remain in its vaults. However, the directors having lent to the governments of Holland and Friesland and to the East India company 10,500,000 florins, the fact became known on the invasion of the French army in 1794, and produced the ruin of the institution. The amount of treasure in the vaults of the bank in

1778 was estimated by Mr. Hope at 88,000,000 florins.—The bank of Hamburg was established in the year 1619. This institution is a bank of deposit and circulation, which circulation is based upon fine silver in bars. The stock of the bank arises out of the deposits, which are confined solely to silver. The bank of Hamburg differs essentially from any other banking institution in the world. The difference at which it receives and pays out the silver deposits, about one half of 1 per cent., constitutes the charge of the bank for custody of the funds intrusted to it. Although in some respects it has undergone changes in its management since it was instituted, still the plan is essentially the same as it was in 1710. It has been felt, as well by the mercantile community of Hamburg as by those directly interested in the bank, that changes are necessary to conform to the present state of business. It is deemed desirable that the bank should be enabled to make better use of its surplus capital, which owing to restrictions is almost valueless. Its deposits, Oct. 10, 1872, were 80,766,666 thalers. The bank of Rotterdam was established in 1635; the bank of Stockholm in 1638.—*British Banks.* The bank of England was established in 1694, William and Mary then being on the throne. To the war with France, and the extreme difficulty experienced by the government in raising funds for conducting that war, is the institution of this monopoly due. The idea originated with William Paterson, a merchant of London, who readily saw that the government, which had been paying interest at the rate of from 30 to 40 per cent. per annum, would without much hesitation grant exclusive and almost unlimited privileges to such parties as would in turn furnish it with a fixed and permanent loan, at a reasonable rate of interest. The plan, being brought to the attention of the king, was submitted to the privy council, when the details were completed, and it was laid before parliament. There, however, it met with the violent opposition of a formidable party. Nevertheless, the bill was carried by the government, and on April 25, 1694, became a law. It was provided that the capital, £1,200,000, should be permanently lent to the government at 8 per cent. per annum, and that in addition to the interest an allowance of £4,000 per annum should be made by the government for the management of the debt. So popular was the scheme, and so great was the desire of the public to become proprietors of the bank, that within ten days after the books were opened the entire capital was subscribed. The corporate title under which this institution commenced operations, and has continued to the present day, is "The Governor and Company of the Bank of England." The bank was opened for business on Jan. 1, 1695, the stockholders having previously elected a governor, a deputy governor, and a board of 24 directors. Those several parties were required by law to hold stock as follows: gov-

ernor £4,000, deputy governor £2,000, and rector £2,000. The charter was granted eleven years, and the officers were required to be elected annually between March 25 and April 25, after the year 1696. The bank immediately issued notes, none of which were, however, of a smaller denomination than 100 sterling, and commenced discounting bills of exchange at rates varying from 3 to 6 per cent, distinction being made in favor of persons who used the bank as a place of deposit. Within two years the institution experienced considerable trouble, under the influence of which notes fell as low as 80 per cent. below par. Although notes to the amount of £480,000 were redeemed, it was found necessary in 1708 to increase the capital £1,000,000 sterling. This increase had the effect within a few months of causing the stock not only to cover a discount of from 40 to 50 per cent. but to sell at a premium of 12 per cent. Since first this institution was founded, its capital and the loan to the government have been nearly identical in amount. In 1833, however, the debt to the bank was reduced about £2,500,000. The following table gives the capital of the bank at various periods, and the dates of the several renewals of the charter, with the amount of government debt at each period:

Date.	Capital.	Date of renewal.	Amount of debt.
1694.....	£1,200,000	1694.....	£1,200,000
1697.....	2,201,171	1697.....	1,200,000
1708.....	4,400,000	1708.....	2,200,000
1709.....	5,000,000	1710.....	2,200,000
1710.....	5,000,000	1710.....	2,200,000
1719.....	5,000,000	1719.....	2,200,000
1722.....	5,000,000	1722.....	2,200,000
1742.....	5,000,000	1742.....	2,200,000
1748.....	10,700,000	1748.....	2,200,000
1788.....	11,600,000	1788.....	2,200,000
1844.....	14,500,000	1844.....	2,200,000

The management of the entire public debt of Great Britain is placed in the hands of the bank of England, for which service it has received compensation, which has from time to time varied in amount according to circumstances. During the year 1845 this compensation was £98,111 19s. 10d. In addition to the permanent debt of the government to the bank, latter contracted with the former on March 1, 1823, to pay at stated intervals between 1823 and 1828 certain pensions and annuities arising out of the then recent wars, amounting to £1,080,419. This is termed the "dead weight." In consideration of this the bank was to receive from the government an annuity of £585,740 for 44 years. On Feb. 26, 1797, an order was issued by the privy council to the bank restraining it from the further payment of specie. On the following day the officers of the bank issued a notice, in which they stated that in consequence of the foregoing order they "think it is their duty to inform the proprietors of the bank stock as well as the public at large, that the general concerns of the bank are in the most affluent and flourishing situation, and such as to preclude every doubt as

the security of its notes." At the same time they announced their determination to continue their usual discounts. The fact was, the order in council simply prohibited the bank from doing that which it was entirely out of the question for it to do. On Feb. 27, the same day on which the bank suspended specie payments, parliament approved the order in council. Notes of the denomination of £1 sterling were immediately prepared and issued, and all fractional parts of a pound were refused payment by the bank. This suspension, while it was absolutely necessary to prevent the ruin of the bank, was of equal importance to every business interest throughout the kingdom. The government, while it interposed for these important ends, was equally interested in the welfare of the institution with which it was so intimately connected in all its financial concerns. It was then struggling through its tremendous efforts against the power of France and Napoleon, and the bank was to it what the heart is to the animal organism, its circulating notes what the blood is to that organism—the very source of vitality and power. Although every assurance was given that this measure was intended to be merely temporary, it was continued from time to time until May 1, 1823, when the resumption of specie payments took place, for which preparation had gradually been made within the previous four years. This was not, however, accomplished without widespread disaster, the details of which are painful to read even at this distant day. This was the case, too, with gold at the following rates of premium in the under-mentioned years: 1816, 2½ per cent.; 1816, October to December, under 1 per cent.; 1817, 2½; 1818, 5; 1819, 6½; 1820 and 1821, par. On the renewal of the charter in 1844, Sir Robert Peel, then prime minister, having become satisfied of the dangerous influence exerted in its ever varying and never stable system, first of expansion and then of contraction, in its loans, thought to provide a remedy. The principal feature of this measure was to limit the circulation so that it would be regulated by the amount of coin and bullion in the vaults of the institution. Accordingly, he brought in a bill which became a law on July 19, 1844, entitled "An act to regulate the issue of bank notes, and for giving to the governor and company of the bank of England certain privileges for a limited period." The following abstract of parts of that law will give an idea of such provisions as refer to the bank of England: § 1. Provides for "the issue department of the bank of England," which shall provide the notes payable on demand, and shall, from Aug. 31, 1844, be kept wholly separate and distinct. § 2. That on Aug. 31, 1844, the bank shall transfer to the issue department securities to the value of 14 millions, the debt due by the public to be deemed part; that the banking department shall transfer to the issue department all the gold coin and gold and silver bullion not required; that the issue department

shall deliver to the banking department such an amount of notes as with those in circulation shall equal the securities, coin, and bullion transferred to the issue department; that the bank may not increase, but may diminish the amount, and again increase it to any sum not exceeding 14 millions. § 3. That the bank shall not retain in its issue department at one time silver to any amount greater than one fourth the gold held at the same time. § 4. That notes may be demanded for gold bullion at the rate of £3 17s. 9d. per oz. of standard gold. § 6. Provides for a weekly statement of the affairs of the bank. § 7. That the bank shall be exempt from stamp duty on its notes. § 8. That the bank allow £180,000 per annum out of the amounts payable by government for the exclusive privileges of banking. § 9. That the public shall receive such profit as may be obtained by an increase of circulation beyond the amount provided by section 2. § 10. That no other banks of issue be allowed but such as were in existence May 6, 1844. § 11. That no banker in England or Wales shall issue any bill of exchange or promissory note payable on demand, excepting such bankers as were in existence May 6, 1844. That no company now consisting of six or less than six partners shall, if they exceed that number, be allowed to issue notes. The important provisions of this act were that the bank might issue £11,000,000, for which the public debt due the bank should be security, and £3,000,000 on exchequer bills and such other government securities as it might hold, but that for every pound sterling issued beyond the £14,000,000 the bank should hold an equal amount in gold and silver. An examination of the operations of the bank will, we think, demonstrate the fact that Sir Robert Peel entirely misapprehended the causes at work in producing the fluctuations complained of, and that he applied the restrictions to that particular branch which varied but little in a series of years. The real cause of trouble was to be found in the loans, which have been irregular in the extreme and at times productive of great injury. This injury has not alone been confined to Great Britain, but has extended in a greater or less degree to every country with which intimate business relations existed. That this act has had no effect in mitigating this crying evil, will be clearly seen in the fact that these fluctuations have never been more violent than since its passage. The British public had long shown entire confidence in the circulating medium, and no legislation to effect this object was necessary. Within the 28 years which have elapsed since its passage, the operation of this law has three times been suspended, as doubtless it will be again whenever it is rendered necessary so to do. The first of these was on Oct. 25, 1847, the second on Nov. 12, 1857, and the third on May 11, 1866, on which latter day the bank raised the rate of discount to 10 per cent, it having been 6 per cent. nine days before. In its efforts to save

itself and comply with the absurd provisions of the bank act, it spread ruin and desolation around it, and years have been necessary to enable the country to recover from the effects

of the panic thus created. While the notes of the bank are legal tender elsewhere, they are not such in payments by the bank itself. Its condition on Oct. 16, 1872, was as follows:

ISSUE DEPARTMENT.			
Notes issued.....	£84,823,700	Government debt.....	£11,015,100
		Other securities.....	8,204,500
		Gold coin and bullion.....	19,898,700
	£84,823,700		£39,118,300
BANKING DEPARTMENT.			
Proprietors' capital.....	£14,000,000	Government securities.....	£12,900,000
Reserve.....	5,148,478	Other securities.....	51,200,571
Public deposits, including exchequer, savings banks, commissioners of national debt, and dividend accounts.....	2,810,196	Notes.....	1,200,700
Other deposits.....	19,640,773	Gold and silver coin.....	600,000
Seven-day and other bills.....	400,000		
	£42,187,196		£64,701,271

—Prior to the establishment of the bank of England, banking in London was conducted first by the Jews, who were succeeded by the Lombards, who were in turn supplanted by the goldsmiths. The latter lent money at rates much below those charged by their predecessors, and they issued promissory notes payable on demand, or at a certain period after date. These bankers deposited their funds at the royal mint in the tower of London. This practice was discontinued when Charles I., being in want of money, seized the amount thus deposited, £200,000, by which means the bankers were utterly ruined. During the civil war the business of the goldsmiths largely increased, and during the commonwealth, as well as subsequently, various plans were devised by different individuals for the establishment of public banks. No action was, however, taken to mature and carry out these plans until the establishment of the bank of England. After the seizure of the funds by Charles I., it was the practice of the goldsmiths to deposit their surplus means in the exchequer, which funds were drawn once a week, to meet such demands as might be made upon their owners. Charles II., in 1672, being in want of money, closed the exchequer, and seized the funds belonging to the goldsmiths, amounting to £1,828,562, on which there accrued 25 years' interest, making thereby a sum total of £3,831,818. No consideration was given for any part of this large sum, except £604,268, for which government loan was issued, forming the basis of the present national debt of Great Britain. As may readily be imagined, the goldsmiths were ruined irretrievably by this infamous proceeding.—The earliest country bank established in England, of which there exists any record, was at Newcastle-on-Tyne, in 1755. This was a bank of issue. From that period the number of these institutions increased. On the renewal of the charter of the bank of England in 1706, the bank obtained the privilege of banking to the exclusion of all copartnerships of more than six persons. In consequence of this law, the various joint-stock banks in existence at the time were compelled to wind up their affairs. In 1825, however, an act was passed allowing

copartnerships of more than six persons to carry on business in England as bankers 65 miles from London, with the provision that each stockholder should be liable for the entire debt of the bank. Notwithstanding the provision of this law, which would seem to prevent any joint-stock bank being established within 65 miles of London, in 1834 the London and Westminster bank was founded, and has been in operation ever since, although not without having troubles to encounter. Litigation with the bank of England, and other difficulties, at first beset it, but through all of these it passed, and has met with high success. Since the establishment of this institution, various others of the kind have been founded in and about London. By the issue act of 1844, no bank in any part of the United Kingdom which did not on May 6, 1844, issue notes, was allowed thereafter to exercise that privilege. By an act passed during the same year, with reference to joint-stock banks in England, so many restrictive clauses were introduced as practically to prevent any new institutions of the kind from being established. Within a recent period, however, the passing of a new act more liberal in its provisions has recognized limited liability, and under it 80 institutions are in operation throughout the United Kingdom at the present time (December, 1872). Perhaps nowhere in the world does the history of banking show greater instability than in England, where during this century joint-stock banks have failed by scores. Their profits have in many instances been very large, but their risks being correspondingly great, their failures have been most disastrous.—Great freedom has always existed in Scotch banking than in that of England, and consequently there has been greater security—those institutions, unlike the great monopoly, trading upon their own capital. The earliest bank established was the bank of Scotland, founded in 1695; followed in 1727 by the royal bank of Scotland, in 1746 by the British Linen company, in 1810 by the Commercial bank, and in 1825 by the National bank. In addition to these, joint-stock banks with limited liability have been allowed freely to be established

These banks have passed readily through commercial crises which have destroyed large numbers of such institutions in England.—Various attempts to establish a public bank in Ireland were from time to time made, and, meeting with opposition in the Irish parliament, were defeated. It was not till 1782 that a bill was passed incorporating the "Governor and Company of the Bank of Ireland," which institution commenced business in Dublin, June 1, 1788, and is still in successful operation. This was succeeded by the Belfast bank in 1808, the Hibernian bank of Ireland in 1825, the Provincial bank of Ireland in 1834, the National bank, and others, all of which are joint-stock banks.—The notes in circulation in the United Kingdom, other than those of the bank of England, in September, 1873, were as follows: England, £5,067,910; Scotland, £5,318,560; Ireland, £7,242,081; total, £17,618,551.—*The Bank of France.* In 1716 a bank was founded in Paris under this name, which was two years subsequently changed to the Royal bank. Under this organization it remained till 1803, when, having been unsuccessful, it was placed upon its present organization as the bank of France, with a capital of 45,000,000 fr., which was in 1806 increased to 90,000,000 fr. At present the capital is 182,500,000 fr., and the charter of the bank extends to Dec. 31, 1897. It is a bank of deposit, discount, and circulation, issuing its own notes, and having an exclusive monopoly of this privilege for the entire country. It is a public institution, the government appointing a governor and two deputy governors, all of whom must be stockholders in the bank. The affairs of the institution are managed by a council general of 20 members, who are elected by 200 of the principal stockholders. No bills are discounted having more than three months to run before maturity, and as a general thing must be guaranteed by three approved signatures, though in some instances two are accepted. The governor annually makes a report of the condition of the affairs of the bank, with statements in detail of its issues, assets, loans, and other particulars. The annual dividends are limited to 5 per cent.; all profits over that amount being invested in 5 per cent. consolidated stock, to be divided among the stockholders at the expiration of the charter. In 1848 banks existed at Rouen, Lyons, Havre, Lille, Toulouse, Orleans, Marseilles, Nantes, and Bordeaux; but by the provisional government these were united to the bank of France. The bank has now 62 branches in various parts of France. In August, 1870, specie payments were suspended, and have so continued to the present time (December, 1872); but the premium on gold has never been over 1 per cent. In October, 1872, the bank had of notes in circulation 2,524,140,010 fr., held cash in hand 786,534,812 fr., treasury bonds and *rentes immobilières*, 1,450,367,500 fr.—*Belgian Banks.* The oldest of these is the *société générale*, founded Aug. 28, 1822, capital 50,000,000 florins. It

was a bank of discount, and managed the finances of the government till after the separation of Belgium from Holland, when it resigned that function to the bank of Belgium. This latter institution, organized originally with a capital of 20,000,000 francs, was in 1838 compelled to suspend payment, a difficulty out of which it was extricated by the government. However, in 1839 it suspended again. In 1841 its capital was increased by 10,000,000 fr., the subscribers to the new stock receiving 5 per cent., while the old stockholders were to have but 4. In addition to this rate of interest, the bank has paid a semi-annual dividend. Up to 1850 it had charge of the affairs of the government, when it resigned them to the National bank of Belgium, founded May 5, 1850. This institution, which is a joint-stock bank, has a capital of 25,000,000 fr. It is a bank of deposit and exchange, and is allowed to issue notes to three times the amount of the coin in its coffers, and issues them of the denominations of 20, 50, 100, 500, and 1,000 fr. In this bank the *société générale* took 10,000,000 of the capital, and the bank of Belgium 15,000,000, both agreeing to cease their issues of notes and abandon their discount business, although retaining their organization and receiving deposits. Oct. 9, 1872, the National bank of Belgium held of specie 123,625,000 fr., had made discounts and advances 284,400,000 fr., and had a circulation of 258,550,000 fr. It pays large dividends to its stockholders.—*Netherlands.* The bank of the Netherlands was first chartered in 1814, with a capital of 5,000,000 florins, which was increased to 10,000,000 in 1819 and 15,000,000 in 1838. Subsequent changes have been made, the last in 1863, when it was rechartered. On Oct. 14, 1872, the condition of the bank was as follows: coin and bullion, 117,768,000 fl.; discounts and advances, 106,056,000 fl.; notes in circulation, 163,832,000 fl.; deposits, 36,456,000 fl.—*Austria.* The National bank of Austria was founded in Vienna in 1816, for the purpose of restoring the finances and credit of the government, which were greatly impaired. It has the exclusive privilege of issuing circulating notes. Its capital is 110,250,000 florins, and its condition, Oct. 9, 1872, was as follows: coin and bullion, 138,760,000 fl.; discounts and advances, 186,480,000 fl.; circulation, 319,190,000 fl. Its charter extends to 1876, and it loans to the state, in consideration of the privileges granted it, 80,000,000 fl. without interest. The rate of discount varies between 4 and 5 per cent. per annum; it issues bills of 5, 10, 100, and 1,000 fl.; and it has 22 branches in different parts of the empire.—*German Empire.* The Royal bank of Prussia was established at Berlin, June 17, 1765, as an exchange and loan bank, with a capital of 400,000 thalers. Dec. 31, 1871, its capital was: bank shares, 20,000,000 thalers; state active capital, 1,906,800; and it had a reserve fund of 6,000,000 thalers, giving an actual working capital of 27,906,800. It held deposits of 20,-

577,088 thalers; notes either in circulation or in the hands of the bank or its branches, 860,723,312; bills of exchange, 114,858,512; Lombard loans, 22,617,865; gold and silver coin and bullion, 277,628,846. Its total transactions, receipts, and disbursements for 1871 amounted to 6,365,839,600 thalers. At the close of 1871, the Prussian branch comprised the chief bank at Berlin and 168 branches in the several provinces of the state, including Alsace and Lorraine. For the year the average rate of discount was 4.18 per cent., Lombard rate 5.18 per cent. Although this institution is a government one, it does not possess monopoly privileges, but other banks are permitted throughout the kingdom. Indeed, much freedom in banking, under certain restraints, has been for years past permitted in northern Germany. The popular or cooperative banks established under the initiative of Schulze-Delitsch have proved a highly important and most beneficent class of institutions in enabling workmen to combine their means for mutual financial assistance in business in a small way. Their study is a subject worthy of the attention of the workmen of this country. They are established without the assistance of capitalists, and make advances only to their members.—The Royal bank of Nuremberg, Bavaria, is an old institution, which does a business of exchange, discount, loan, and deposit. It is connected with the state, and its affairs are managed by finance ministers. It has several branches. No publication of its affairs is made. The Loan and Exchange bank of Bavaria began operations in 1835, and was chartered for 99 years from 1834. It lends on goods, and discounts bills of exchange, Bavarian securities, and specie, and effects fire and life insurance. Its issue is limited to 8,000,000 florins, 2,000,000 being based on specie.—The bank of Leipzig, Saxony, was founded in 1839, with a capital of 1,500,000 thalers, which has since been increased, provision also being made for a large reserve. The Saxon bank in Dresden was founded in 1805, and on Dec. 31, 1871, held of coin and bullion 9,215,000 thalers, treasury and other notes 1,400,000 thalers, bills of exchange 11,678,000 thalers, Lombards 4,282,000 thalers, and had notes in circulation 20,988,000 thalers.—There are four banks at Stuttgart, Württemberg. There are also banks at Königsberg, Frankfort, Cologne, Darmstadt, Weimar, Brunswick, Bremen, Dessau, and other points in the German empire, issuing circulating notes.—*Switzerland.* Basel and Geneva have long been famous for the character and wealth of their banks, but the earliest Swiss bank of issue, that of St. Gall, only dates from 1838. At the end of 1869 there were 19 such banks in that country—those of St. Gall, Zürich, Vaud, Basel, Geneva (bank of Commerce and bank of Geneva), Thurgau, Glarus, Neuchâtel, Fribourg, Aargau, Valais, Lucerne, Soleure, Bern, Ticino, Grisons, and Schaffhausen. They make dividends of from 4½ to 7½ per cent. Their condi-

tion, Dec. 31, 1869, was as follows: circulation 18,468,122 fr.; deposits, 49,166,405; specie 19,880,922; capital, 73,857,784; loans (exclusive of those of the bank of St. Gall, capital 5,858,612 fr.), 71,667,706.—*Italy.* The oldest existing bank in Italy is that of the Monte Paschi of Siena, founded in 1092. The National bank of Italy, created by royal decree Nov. 14, 1849, was the result of a union between the two banks at Genoa and Turin, the former founded in 1844, the latter in 1846. Its charter lasts till Dec. 31, 1899, and its capital, originally 40,000,000 lire, is now 100,000,000. By act of Sept. 2, 1866, circulation of bank notes was limited to 700,000,000 lire. They are a legal tender by act of May, 1860. The bank has gradually extended its action over Italy, and has seats in Genoa, Turin, Milan, Naples, Palermo, Florence, and Venice, had in 1870 branches in all parts of the kingdom. It is a bank of discount, deposit, and circulation. Its condition in 1870 was as follows: Discounts 828,668,172 lire; average circulation, 775,877,712. On Oct. 31, 1869, it had specie and bullion 178,000,000 lire. The state is a large debtor to this institution, and its financial operations are mainly conducted by the aid of it. There are also the following: Bank of Naples, bank of Palermo, National bank of Tuscany, Credit bank of Tuscany, Mercantile Establishment of Venetia, Anglo-Italian bank (founded in London in 1864), Farmers' Credit bank of Pavia, National Discount bank of Tuscany, General bank of Genoa, Italian Credit bank of Turin, Discount and Silk bank of Turin, &c. In August, 1871, there were in Italy 39 credit institutions and banks (the National bank and its branches counting as 1), and 87 people's banks. Of the former 31 publish reports showing a paid-up capital of 86,141,268 lire; and of the latter 51 give reports showing a paid-up capital of 17,501,888 lire.—*Spain, Portugal, Denmark, Sweden and Norway, Russia, and Greece.* All have their banking systems, more or less intimately connected with the fiscal operations of their respective governments.—*BANKS IN THE UNITED STATES.* *The Bank of New America.* During the war of the revolution the country being extremely poor, with few industries but agriculture, and quite devoid of the precious metals, from a heavy and continued adverse foreign trade, the congress of the United States experienced great difficulty in providing the requisite means for carrying on hostilities. On May 10, 1775, soon after the battle of Lexington, congress made preparation to issue continental paper, \$2,000,000 of which were put in circulation on June 1 following. From month to month these issues, which in the aggregate reached \$300,000,000, depreciated, until eventually they became entirely valueless, notwithstanding the passage of laws making them a legal tender for the payment of debts. On May 17, 1781, a plan of a national bank was submitted to congress.

by Robert Morris of Pennsylvania, the principal provisions of which were as follows: The capital to be \$400,000, in shares of \$400 each; that each share be entitled to a vote for directors; that there be 12 directors chosen from those entitled to vote, who at their first meeting shall choose one as president; that the directors meet quarterly; that the board be empowered from time to time to open new subscriptions for the purpose of increasing the capital of the bank; statements to be made to the superintendent of the finances of America; that the bank notes payable on demand shall by law be made receivable for duties and taxes in every state, and from the respective states by the treasury of the United States; that the superintendent of the finances of America shall have a right at all times to examine into the affairs of the bank. On May 26 congress passed the following: "Resolved, that congress do approve of the plan for the establishment of a national bank in these United States, submitted for their consideration by Mr. R. Morris, May 17, 1781, and that they will promote and support the same by such ways and means, from time to time, as may appear necessary for the institution and consistent with the public good; that the subscribers to the said bank shall be incorporated agreeably to the principles and terms of the plan, under the name of 'The President, Directors, and Company of the Bank of North America,' so soon as the subscription shall be filled, the directors and president chosen, and application for that purpose made to congress by the president and directors elected." On Dec. 31 following congress passed "an ordinance to incorporate the subscribers to the bank of North America." The first president was Thomas Willing, and the bank became at once a most important auxiliary in aid of the finances of the government, and so continued to the conclusion of the war. This institution was also incorporated by the state of Pennsylvania, on April 18, 1782. The bank commenced business in January, 1782, with a capital of \$400,000, of which \$254,000 had been subscribed by the government. In the year 1785, when an ill feeling had arisen between the government of the state of Pennsylvania and the bank, the former repealed the charter which it had granted in 1782. The bank, however, continued its operations under the charter granted by the general government till 1787, when it was rechartered by the state of Pennsylvania. It has from time to time been rechartered, and now exists under the national system with a capital of \$1,000,000, and a surplus of \$1,000,000.—*The First Bank of the United States*. On the organization of the government of the United States under the constitution, Alexander Hamilton, in his masterly report on the finances in 1790, urged upon congress the importance of establishing a bank of the United States. This measure, although it met with vigorous opposition in the house

of representatives, passed that body Feb. 8, 1791, having on Jan. 20 passed the senate with but slight resistance. The following abstract of the 12 clauses of the charter will give an idea of the act: 1. The capital shall be \$10,000,000, to be divided into 25,000 shares of \$400 each. 2. Any person, copartnership, or body politic may subscribe for such number of shares as he, she, or they may think proper, not exceeding 1,000, except as regards the subscription of the United States. The subscriptions, except those of the United States, shall be payable one fourth in gold and silver, and the remaining three fourths in certain 6 per cent. stocks of the United States. 3. The subscribers are incorporated under the name and style of "The President, Directors, and Company of the Bank of the United States," and to continue till March 4, 1811. The bank is authorized to hold property of all kinds, inclusive of its capital, to the amount of \$15,000,000. 4. Twenty-five directors are to be elected by a plurality of the votes cast, on the first Monday in January of each and every year, for one year only, and the directors are empowered to choose one of their number for president. 5. As soon as the sum of \$400,000 is received on account of the subscriptions, in gold and silver, on proper notice being given, the bank may be organized. 6. The directors are authorized to choose such other officers, clerks, and servants as may be necessary for the bank, and shall otherwise manage the affairs of the bank. 7. This clause prescribes the "rules, restrictions, limitations, and provisions which shall form and be fundamental articles of the constitution of said corporation." 8. If the corporation, or any person or persons for or to the use of the same, shall buy or sell any goods, wares, or merchandise whatsoever, contrary to the provisions of this act, such person or persons shall forfeit and lose treble the value of said goods, wares, and merchandise, one half to the United States, and the remainder to the informer. 9. If the corporation shall lend to the government of the United States any sum of money to an amount exceeding \$100,000, or to any state to an amount exceeding \$50,000, or to any foreign prince or state (unless previously authorized by law), all and every person concerned in any way in causing the same to be lent shall for each and every offence, on conviction, forfeit and pay a sum treble the value of said loan or loans—one fifth to the informer, and four fifths to the United States. 10. Bills or notes of the bank payable in coin shall be taken in payments to the United States. 11. The president of the United States may within 18 months from April 1, 1791, cause a subscription to be made to the stock on behalf of the United States for an amount not exceeding \$2,000,000, to be paid out of the moneys which shall be borrowed by virtue of either of two certain acts providing for the payment of the debt of the United States, "borrowing from the bank an equal

to be applied to the purposes for which the said moneys shall have been procured; and in 10 years in equal annual installments, or at any time sooner, or in any other proportions that the government may think fit. 12. That no other bank shall be established by any future law of the United States during the continuance of the corporation hereby created, for which the faith of the United States is hereby pledged." The bank was established in Philadelphia, with branches at different points. The dividends of the bank averaged from 8 to 10 per cent. per annum, being much below those of the bank of North America in previous years; which, in the words of a distinguished writer, now "gradually declined as other banks sprang into existence." In 1806, three years prior to the expiration of the charter, application was made to congress for a renewal of the charter, and Mr. Gallatin, the then able head of the treasury department, in obedience to a resolution of the senate, reported to congress upon the memorial. Mr. Gallatin proposed some changes in the new act of incorporation, and highly recommended the reincorporation of the bank, for which he gave his reasons in a clear and conclusive manner. Nothing, however, was done. From time to time the matter was brought to the attention of congress, until Feb. 5, 1811, when a bill was brought forward, but was on Feb. 20 defeated by the casting vote of Vice President Clinton. The bank was now obliged to wind up its affairs, which was done without at all disturbing the country. Within about 18 months the stockholders had received 88 per cent. on their stock. On finally closing its business, the notes yielded to the stockholders a premium over the par value of $8\frac{1}{2}$ per cent. An application had previously been unsuccessfully made to the legislature of Pennsylvania for the recharter of this institution, with a capital of \$5,000,000.—*Second Bank of the United States.* During the war of 1812-'15 the government, which was embarrassed for the want of means, had received important aid from the banks. By this means the banks, with the exception of those in New England, were, in August and September, 1814, driven to a suspension of specie payments. The finances of the government were now in a terrible condition, when, on Oct. 1, Alexander J. Dallas was called to the head of the treasury department. Never before had there been greater need of a master mind in an important office. Within less than a fortnight the new secretary communicated to congress a report of extraordinary ability, in which he strongly recommended the establishment of a national bank, as the remedy required again to bring the finances into order. Various plans for a bank were brought forward in congress, which resulted in nothing, until, on Jan. 20, 1815, a bill was passed. This bill was vetoed by President Madison, on the ground that it could not accomplish the objects rendered necessary by the state of the revenue and the

condition of the country. On April 2, 1816, however, a bill for a bank of the United States, which had previously passed the house of representatives, was adopted by the senate, and receiving the signature of the president, became a law. The corporate title of this institution was "The President, Directors, and Company of the Bank of the United States." Its capital was to be \$35,000,000, composed of 350,000 shares of \$100 each; \$7,000,000 of the stock was to be subscribed by the United States, and the remaining \$28,000,000 by individuals, companies, or corporations. The charter was to extend to March 3, 1836, and the bank was authorized to organize and commence business as soon as \$3,400,000, exclusive of the subscription of the United States, was paid in. It was prohibited from lending on account of the United States more than \$500,000, or to any state more than \$50,000, or to any foreign prince or power any sum whatever, without the sanction of law previously being obtained. The bank went into operation Jan. 7, 1817, and through its agency the other banks throughout the country were enabled and induced to resume specie payments. An unsuccessful effort was made in 1818 to repeal the charter, on the ground of alleged mismanagement. President Jackson in his message of December, 1829, intimated that "constitutional difficulties" might interfere to prevent its recharter, and expressed the desire that congress might take the matter into early consideration. Committees of both houses reported favorably to a recharter, but no application was made by the bank until the session of 1831-'2. On July 4, 1832, a bill rechartering the bank was sent to the president, who on the 10th of the same month returned it with a message stating his objections to it. An effort now being made to pass the bill over the veto of the president, but without success, the bank on March 3, 1836, ceased to act under the charter granted by the United States, but was in the same year rechartered by the state of Pennsylvania, with the same capital. On Oct. 9, 1839, the United States bank suspended specie payments for a second time, having previously suspended in 1837, a measure which was adopted immediately by all the banks throughout the state of Pennsylvania, and eventually, with comparatively limited exceptions, throughout the country. On Jan. 18, 1840, in compliance with an act of the legislature, it resumed specie payments—to suspend finally on Feb. 4. On winding up its affairs, after payment of its debts, there remained nothing to its stockholders, the entire capital having been sunk.—*State Banks.* Prior to the passage of the act "to provide a national currency," &c. by congress, in 1864, the charter of all banks of issue and deposit was by the several states. No fewer than 1,400 of these state institutions existed in 1856-'7. In the New England states at that date there were 507 banks and branches with a capital of \$114,611,752. An important feature in New England banking at that time

was the "Suffolk bank system," through which the notes of all New England banks were collected and redeemed at the Suffolk bank in Boston, each bank making a stipulated deposit for that purpose, amounting in the aggregate to \$300,000.—*National Banks.* The exigencies of the civil war, 1861-'5, requiring that the government of the United States should have other than the ordinary demand among the people for the absorption of the bonds which it was from time to time issuing, led to the law of 1864 entitled "An act to provide a national currency, secured by a pledge of United States bonds, and to provide for the circulation and redemption thereof." This act was approved June 3, 1864, and provides among other things for a separate bureau in the treasury department, the chief officer of which shall be denominated the comptroller of the currency, and it shall be under the general direction of the secretary of the treasury; that associations for carrying on the business of banking may be formed, consisting of not less than five persons; that no association shall be organized under this act with a less capital than \$100,000, nor in a city whose population exceeds 50,000 with a less capital than \$200,000, but that banks with a capital of not less than \$50,000 may, with the approval of the secretary of the treasury, be established in any place the population of which does not exceed 6,000; that such associations shall have existence for 20 years, and may exercise the general powers of banking companies; the capital shall be divided into shares of \$100 each; that stockholders shall be equally and ratably liable to the extent of the stock for the debts and contracts of the bank; that every association, preliminary to the commencement of banking business, shall transfer United States bonds to an amount not less than \$30,000, and not less than one third of the capital stock paid in; that upon the proper examination being made into the affairs of the proposed institution, it shall be entitled to receive from the comptroller of the currency circulating notes equal in amount to 90 per cent. of the current market value of the bonds transferred, but not exceeding 90 per cent. of the par value of said bonds; that notes to an amount not exceeding \$300,000,000 may be issued under this act; that these notes shall be received at par in all parts of the United States in payment of taxes, excises, public lands, and all other dues to the United States, except for duties on imports, and also for all salaries and other debts and demands owing by the United States to individuals, corporations, and associations within the United States, except interest on the public debt, and in redemption of the national currency; that the rate of interest to be charged shall be that allowed by the laws of the state or territory where the bank is located, or in the absence of any such rate, not exceeding 7 per cent.; that each of the banks in St. Louis, Louisville, Chicago, Detroit, Milwaukee, New Orleans, Cincinnati,

Cleveland, Pittsburgh, Baltimore, Philadelphia, Boston, New York, Albany, Leavenworth, San Francisco, and Washington city shall at all times have on hand in lawful money of the United States an amount equal to at least 25 per cent. of the amount of its notes in circulation and its deposits, and that all others shall keep a reserve of not less than 15 per cent.; that every association shall pay to the treasurer of the United States in the months of January and July $\frac{1}{4}$ per cent. each half year on the average amount of its notes in circulation, and a duty of $\frac{1}{4}$ per cent. each half year upon the average amount of its deposits, and a duty of $\frac{1}{4}$ per cent. each half year on the average amount of its capital stock beyond the amount invested in United States bonds; that any state bank may become a national bank under this act. By an act amending the foregoing act, approved March 3, 1865, it was provided that notes shall be issued to associations according to capital as follows: to each not exceeding \$500,000, 90 per cent.; to each whose capital exceeds \$500,000, but does not exceed \$1,000,000, 80 per cent.; to each whose capital exceeds \$1,000,000, but does not exceed \$3,000,000, 75 per cent.; to each whose capital exceeds \$3,000,000, 60 per cent.; and that \$150,000,000 of the entire amount of circulating notes authorized to be issued shall be appropriated to associations in the states, in the District of Columbia, and in the territories, according to representative population, and the remainder shall be apportioned by the secretary of the treasury among associations formed in the several states, in the District of Columbia, and in the territories, having due regard to the existing banking capital, resources, and business of such state, district, or territory. By an act to provide ways and means for the payment of compound-interest notes, approved March 2, 1867, it was provided that temporary loan certificates, bearing 8 per cent. per annum interest, may be issued to an amount not exceeding \$50,000,000, and used for this purpose; and further, that said certificates may constitute for any national bank a part of the reserve provided for by law, provided that not less than three fifths of the reserve of such bank shall consist of lawful money of the United States. By a further act approved July 25, 1868, provision was made for the issue of an additional amount of \$25,000,000 of temporary loan certificates. By an act approved July 12, 1870, it was provided that \$54,000,000 additional circulation may be issued to national banks; that the circulation of no bank thereafter organized shall exceed \$500,000; that at the end of each month an amount of certificates of indebtedness equal to the amount of notes issued during that month shall be called in, paid, and cancelled. This act also provides for the issue of circulating notes redeemable in coin to such banks as may be instituted, the circulation of no such bank under said act to exceed \$1,000,000, these notes to be secured by pledge of United

ates bonds. This act further provided for the redistribution of \$25,000,000 of bank circulation to banks in states not having their proper proportion, to be taken from banks in states having circulation in excess. This, however, was not to be done until the full amount of \$54,000,000 of new circulation provided for by this act had been applied for and issued. Under the provisions of this act four gold banks have been authorized: one in Massachusetts, with a capital of \$200,000—circulation issued, 120,000; and three in California, with an aggregate capital of \$2,800,000—circulation issued, \$1,491,100. By means of a provision in an act to amend an act entitled 'An act to provide internal revenue,' &c., approved March 8, 1865, congress effectually drove from circulation the notes of all banks chartered under state laws by taxing all such circulation paid out by them 10 per cent. per annum. On Oct. 8, 1872, there were in operation in the United States 1,919 national banks, and their condition was as follows:

ASSETS.	
Interest and discounts	\$672,220,104 25
Redemptions	4,877,819 19
United States bonds to secure circulation	202,044,400 00
United States bonds to secure deposits	15,479,758 08
United States bonds and securities on hand	12,342,550 00
Other stocks, bonds and mortgages	28,589,331 73
Due from redeeming and reserve agents	80,717,971 20
Due from other national banks	24,434,598 87
Due from state banks and bankers	12,974,873 01
Real estate, furniture, and fixtures	22,378,408 17
Current expenses	6,810,428 79
Reserves	6,544,848 54
Checks and other cash items	14,916,794 84
Exchanges for clearing houses	110,094,815 37
Due of other national banks	15,734,998 00
Due of state banks	58,196 00
National currency	2,151,747 00
Notes	18,229,758 79
United tender notes	103,074,104 80
Clearing-house certificates	8,992,000 00
United States certificates of deposit	4,710,000 00
Three per cent. certificates	1,550,000 00
	\$1,758,287,094 24
LIABILITIES.	
Capital stock	\$479,889,174 00
Surplus fund	110,387,819 45
Undivided profits	48,889,794 80
National bank notes outstanding	222,675,027 00
State bank notes outstanding	7,547,169 00
Dividends unpaid	2,149,749 81
Individual deposits	623,390,871 45

Due to state banks and bankers	28,739,073 93
Coin and bills redeemed	5,549,491 00
Due payable	9,040,548 00
	\$1,758,287,094 24

The distribution of national banking capital throughout the country is very unequal, and based upon no sound or equitable principles. This is shown by the fact that Boston, with a population of 250,000 and a manufacturing industry of \$111,000,000 per annum, has 48 banks with a capital of \$48,600,000 and circulation of \$26,059,468; while Philadelphia, with a population of 674,000 and a manufacturing industry of \$325,000,000 per annum, has but 9 banks with a capital of \$18,225,000 and a

circulation of \$11,333,620.—In several of the states banks exist under state charters, but without circulation. In the state of New York there are 70 state banks, having on Sept. 21, 1872, a combined capital of \$24,845,040; circulation (not yet sent in for redemption), \$126,937; deposits, \$78,805,491; loans, \$66,076,861; and specie, \$1,261,772. In Pennsylvania, and especially in Philadelphia, the effort has been made, and to some extent with success, to supply the great deficiency of national banks with state banks—the former being quite inadequate to the present large and rapidly extending manufacturing business and trade of that city.—*Banks of Canada.* The condition of the Canada banks, Sept. 30, 1872, was as follows: paid-up capital, \$44,157,690; circulation, \$24,422,451; deposits, \$57,581,646; specie, \$6,601,380; loans to government, \$557,238—to corporations and individuals, \$109,521,798.—*Clearing House.* The clearing house is an institution founded, not merely upon the idea of saving time and trouble in the use of the precious metals, but also of circulating notes. All the banks and bankers associated as members of a clearing house are for this purpose, as it were, but one individual. The clearing house of London, the first of its kind, originated among the bankers of that city, whose transactions in the checks, bills, and drafts drawn upon each other became so large as to call for the daily and even hourly use of vast sums in bank notes by all of them. Appreciating how readily the debits and credits respectively due or held by them might be set off the one against the other, they formed the clearing house, where up to 4 o'clock each day all drafts, bills, &c., drawn upon each individual member were taken. The system of the London clearing house has recently been much extended and improved, and all balances are settled by checks drawn upon the bank of England—no bank notes being required at all. Clearing houses exist in New York, Philadelphia, Boston, and other cities of the United States. The system in that of Philadelphia is equal and in some respects superior to that of any other in the United States. The clearings are made each morning at 8.30, just before which hour a messenger and a clerk from each bank are at the clearing house. The clerks take their seats inside a series of desks arranged in the form of a hollow oval. Each messenger brings with him from his bank a sealed package for each other bank, containing all the checks or drafts on such bank. The name of the bank sending and that of the bank to which it is sent are printed on each package, and the amount sent is written thereon. The messengers take their places near the desks of their respective banks, and they have with them tabular statements of the amount sent to each bank and the aggregates. These are exhibited to the respective clerks and noted by them on the blank forms. At 8.30 precisely the manager calls to order and gives the word, when all the mes-

sengers move forward from left to right of the clerks, handing in to those clerks the packages addressed to their respective banks, and taking receipts for them on their statements. When the circuit is completed all the packages have been delivered and received, and the amounts and the aggregates, both debtor and creditor, noted by the clerks. When the clerks find all correct the messengers take the packages received, and return to bank. The several clerks then pass round a memorandum of the debits, credits, and balance, each of his respective bank. When these memoranda have made the circuit, each clerk has on his statement the debits, credits, and balance, whether debtor or creditor, of each bank. If these debits and credits and debtor and creditor balances are found to balance, the clerks now leave the clearing house. If not, they remain until the error or errors are discovered. The balances due by the several banks are paid in to the clearing house that day by 11.30 A. M., and are receivable by the creditor banks by 12.30 P. M. A second clearing of drafts, &c., received by the morning's mail, is made at the clearing house by the messengers at 11.30 A. M. Each bank is obliged daily to furnish to the clearing house a statement of its condition at the end of business hours on that day; and tables are daily furnished to the several banks of the condition of all the banks in the clearing house. Complete records of all the transactions, of the state of the banks, &c., are preserved in the books of the clearing house, precisely as are the business transactions of any bank, or other corporation or mercantile firm. From October, 1871, to October, 1872, the operations of the New York clearing house were as follows: exchanges, \$38,844,869,568; cash balances, \$1,428,582,707; average daily exchanges, \$105,964,277; average daily balances, \$3,939,265, or less than 34 per cent.; so that by the intervention of this institution \$8 75 are made to do the work which would require \$100 without it, and which in fact does require \$100 in the country, where men are isolated. (See also SAVINGS BANK.)

BANK BAN, or *Ben Bank*, a Hungarian military governor, executed with his whole family by order of King Andrew II. (1206-'85). Bank's wife having been seduced by the queen's brother Eckart, with the queen's connivance, he placed himself at the head of a mob who stormed the palace in the king's absence and cut the queen to pieces, Eckart barely escaping with his life to Styria (1214). Katona's *Bank-bán*, a celebrated Hungarian drama (Klausenburg, 1827), has been translated into German (Leipsic, 1858). Grillparzer also dramatized the subject in *Ein treuer Diener seines Herrn* (Vienna, 1830).

BANKRUPT (low Lat. *bancus*, a bench, and *ruptus*, broken), an insolvent debtor. In its more ordinary acceptation, bankruptcy expresses inability to pay one's debts, being in that sense the same as insolvency. The theory of bank-

ruptcy in England until recently has been, that it was a criminal offence, and the proceeding was in form hostile to the party charged with being bankrupt. The first bankrupt law was enacted in the reign of Henry VIII., in which act the persons amenable to its provisions are described as "those who obtain other men's goods on credit, and then suddenly flee to parts unknown, or keep house, and there consume their substance without paying their debts." In subsequent statutes the character of the bankrupt was defined with more precision, and by the term was generally understood a trader who should do certain acts specified in the statutes which were declared to constitute bankruptcy. The English bankrupt laws were wholly remodelled by act 32 and 37 Victoria, c. 71, on more humane principles. Under that act all persons may be adjudged bankrupt, whether they be traders or not. A person becomes a bankrupt when adjudged so by the court, upon the petition of a creditor having a liquidated and unsecured debt of not less than £50, or of several creditors having like debts to that amount. But before such petition can be presented, the debtor must have committed some one of the acts of bankruptcy specified in the statute, which are: 1, making a general assignment of his property for the benefit of creditors; 2, making a fraudulent conveyance, gift, delivery, or transfer of property; 3, doing, with intent to defeat or delay his creditors, any of the following acts: departing from or remaining out of England, or (being a trader) departing from his dwelling house or otherwise absenting himself, or beginning to keep house, or suffering himself to be outlawed; 4, fling in the manner prescribed by the rules of court a declaration that he is unable to pay his debts; 5, having execution for a debt of £50 or upward levied upon his goods; 6, having neglected to pay or secure or compound the prisoner's debt after having had a debtor's summons served upon him, being a trader, within seven days, and being a non-trader, three weeks after service. An adjudication founded upon any of these acts of bankruptcy will not, however, be granted unless the petition be presented within six months after the act was committed. The act upon which the petition is founded, or the earliest act of bankruptcy proved to have been committed within the twelve months next preceding the presentation of the petition, constitutes the commencement of the bankruptcy. No creditor is allowed to commence or prosecute any proceeding against the bankrupt after the adjudication unless by leave of the court, and all the ordinary remedies are taken away except those of the secured creditors in respect to their securities. Creditors must prove their demands under the bankruptcy, and for the purposes of a distribution of the property they are allowed to appoint a trustee, and also from their own number a committee of inspection for the purpose of guiding, and in some measure controlling, the trustee in the discharge of his

duties. The title of the trustee relates back to the commencement of the bankruptcy. The creditors at any meeting have the right to give directions to the trustee as to the manner in which the property shall be administered by him. Property held by the bankrupt in trust, the tools of his trade if any, and the necessary wearing apparel and bedding of himself and his family—such tools, apparel, and bedding not exceeding in value £50—will not pass to the assignee; but property acquired by or devolving upon the bankrupt pending the proceedings will pass, and also the capacity to exercise or take proceedings to exercise all powers over property for his own benefit. If he is a trader, goods and chattels in his hands as reputed owner, with the permission of the true owner, will also pass to the trustee. Until the appointment of a trustee, and during any vacancy which may occur, the registrar of the court is the trustee. When the property has been realized the court declares the bankruptcy closed, and the bankrupt may apply for his discharge. This is only granted where the assets pay 10s. in the pound, or where the creditors shall have passed a resolution by a majority in number representing three fourths in value of the debts to the effect that a discharge should be granted. A discharge releases the bankrupt from all debts provable under the bankruptcy, except those which he incurred by means of any fraud or breach of trust, and those of which he obtained forbearance by means of fraud, and also those due to the crown or relating to the revenue; but of these last he may be discharged if the commissioners of the treasury consent thereto. If the bankrupt fails to obtain his discharge, a period of three years is given him during which, if he pays to his creditors such sum as, together with the dividends already received by them, make up 10s. in the pound, he is to obtain his discharge. In the mean time debts provable in bankruptcy are not to be enforced against his property; but if at the expiration of that time he has not thus obtained his discharge, debts provable under the bankruptcy stand as judgment debts against him, but without interest.—In the United States, power is conferred upon congress by the constitution to establish a uniform system of bankruptcy. When this power is exercised, it supersedes the state insolvent laws, which are in their nature similar to the bankrupt acts. It was first exercised by act of April 4, 1800, repealed Dec. 19, 1803; again by act of Aug. 19, 1841, repealed in 1843; again by act of March 2, 1867, now in force. This act embraces in its provisions any person residing within the jurisdiction of the United States owing debts to the amount of more than \$300 provable under it. It contains what are called voluntary provisions, under which an insolvent debtor may himself be the petitioner for his discharge, and involuntary provisions, under which the creditors become petitioners when they believe an act of bankruptcy has

been committed. No debt created by the fraud or embezzlement of the bankrupt, or by his defalcation as a public officer, or while acting in any judiciary capacity, is barred by a certificate of discharge issued under the act. Original jurisdiction of the proceedings is possessed by the United States district courts, but registers in bankruptcy are appointed, by whom the major part of the business is transacted. Contested issues are adjourned by the registers for hearing in court, and the debtor who disputes the allegations of the creditors against him may demand trial by jury. The acts of bankruptcy enumerated are as follows: 1, departing from the state, territory, or district of which the person is an inhabitant, with intent to defraud his creditors; 2, remaining absent with the like intent; 3, concealing himself to avoid the service of legal process for the recovery of any debt provable under the act; 4, concealing or removing property to avoid legal process; 5, making an assignment, gift, sale, conveyance, or transfer of his estate, property, rights, or credits, with intent to delay, hinder, or defraud creditors; 6, being under arrest for a period of seven days on an execution upon a debt provable under the act, for more than \$100; 7, being actually imprisoned for more than seven days in a civil suit founded on contract, for \$100 or upward; 8, making any payment, gift, grant, sale, conveyance, or transfer of money or other property, estate, rights, or credits, or giving any warrant to confess judgment, or procuring or suffering his property to be taken on legal process while bankrupt or insolvent, or in contemplation of bankruptcy or insolvency, with intent to give a preference to one or more of his creditors, or to persons liable for him as sureties or otherwise, or with intent by such disposition of his property to defeat or delay the operation of the act; 9, a banker, broker, merchant, trader, manufacturer, or miner, fraudulently stopping payment, or having stopped or suspended, and not resumed payment of his commercial paper within 14 days. In the distribution of the bankrupt's estate the following demands are preferred: 1, the cost of the proceedings; 2, all demands owing to the United States; 3, all demands owing to the state in which the proceedings are had; 4, wages due to any operative, clerk, or house servant, to an amount not exceeding \$50 for labor performed within six months next preceding the first publication of the notice of proceedings in bankruptcy; 5, all other debts which by the laws of the United States are or may be entitled to priority, in like manner as if the act had not been passed. Other demands are paid ratably, except that specific liens are not disturbed or devested, unless where created in contemplation of bankruptcy or in fraud of the law. There are saved to the bankrupt his necessary household furniture and other articles designated by the assignee, not exceeding in value \$500; the wearing apparel of himself and family; the uniform, arms, and

equipments of any one who is or has been a soldier in the militia or army; and any other property that is or may be exempt from levy and sale by the laws of the United States or by those of the state in force in 1867. With the exception of the exempt property, the assignment under the act carries to the assignee all the estate of the bankrupt, and dissolves all attachments of any of the property made on mesne process within four months previous to the commencement of the proceedings. A discharge is granted to the bankrupt as a matter of course unless he has been guilty of some act forbidden by the statute, or of some fraud upon creditors, or lost property by gaming, or suffered voluntary loss or destruction to his estate; but in cases commenced a year after the act went into operation, no discharge is granted unless the assets pay 50 per cent. of the debts, or a majority in number and value of the creditors assent; and in cases of second bankruptcy no discharge is granted unless the assets pay 70 per cent., or unless three fourths in value of the creditors assent, or unless the debts owing at the time of the previous bankruptcy have been paid or released. For the following acts the bankrupt is punishable criminally: Secreting or concealing property belonging to his estate; concealing, destroying, altering, &c., books, papers, &c., with fraudulent intent; making gifts, payments, &c., with the like intent; spending any part of his estate in gaming; fraudulent omission of property from the schedule; failing to disclose knowledge of fraudulent claims against the estate; attempting to account for any of his property by fictitious losses or expenses; obtaining fraudulent credit within three months before commencement of the proceedings, and with intent to defraud creditors; making disposition of property bought on credit and not paid for, otherwise than by *bona fide* transactions in the ordinary way of his trade, within three months before the commencement of proceedings. The maximum punishment that may be inflicted is three months' imprisonment with or without hard labor.—In Scotland and Ireland the bankruptcy laws are in their effect substantially the same as in England. In France, the tribunal of commerce proceeds summarily to sequester the estate of a bankrupt merchant, and apply the same in payment of his debts. From the day of failure the bankrupt is divested of all title to or control over his property; his counting-house is closed, and his effects put under seal; a member of the court is appointed a commissioner to take charge of the effects, with the aid of certain agents, who have surveillance of the same until the creditors are convened for the nomination of syndics (trustees); and the debtor himself in the mean time may be imprisoned or compelled to give security to undergo examination in respect to his property. The family of the bankrupt are entitled to retain their apparel and household furniture; the wife also retains any interest belonging to her

by a marriage stipulation, or which she has herself acquired by the use of her own separate estate. The proceeds of the bankrupt's estate are distributed by the syndics to the creditors; the bankrupt is subject to imprisonment, or to be condemned to forced labor, in case of fraudulent bankruptcy or of insolvency clearly traceable to imprudence or extravagance.—There are similar proceedings in all the commercial countries of Europe, some more and some less severe, but all of them being founded upon the presumption of fraud having been committed by the bankrupt, from which he is to purge himself upon a strict investigation of his affairs. In Holland he is discharged from all further liability for his debts upon getting a certificate from one half of his creditors, to whom is due five eighths of his debts.

BANKS, a N. E. county of Georgia, watered by Broad river and its affluents; area, 250 sq. m.; pop. in 1870, 4,978, of whom 921 were colored. The chief productions in 1870 were 11,814 bushels of wheat, 114,167 of Indian corn, 11,069 of oats, 12,268 of sweet potatoes, and 398 bales of cotton. Capital, Homer.

BANKS, *John*, an English dramatist of the 17th and 18th centuries; the dates of his birth and death are unknown. He was a London attorney, and left his profession to write for the stage. He published seven tragedies between 1677 and 1696. Of these, "The Unhappy Favorite," founded on the fate of the earl of Essex (beheaded in the reign of Elizabeth), was a stock play for a long time, and was freely used by later playwrights. His dramas were popular, but their literary merit is small.

BANKS, *Sir Joseph*, an English naturalist and traveller, born in London, Jan. 4, 1743, died June 19, 1820. At Eton school he first showed a taste for botany, which he cultivated afterward with enthusiasm at Oxford. In 1764, at the age of 21, he came into his paternal property, which was considerable. Two years later he became fellow of the royal society, after which he made a voyage to Newfoundland and Labrador, with Lieut. Phipps of the royal navy, to collect plants. On his return he formed an intimacy with Dr. Solander, a Swede, the pupil of Linnæus. The four years following Mr. Banks devoted to the study of botany and natural history, and through the interest of the earl of Sandwich, who was then first lord of the admiralty, was appointed with Dr. Solander naturalist to the expedition under the command of Capt. Cook, which sailed from England in August, 1768, to visit Tahiti for the purpose of observing the transit of Venus. In this voyage, which lasted three years, he visited Tierra del Fuego, Tahiti, New Zealand, and New South Wales. In 1772 he made a voyage to Iceland with Dr. Solander, visiting the Hebrides on his return, and discovering the columnar formation of the rocks surrounding the caves of Staffa. On the retirement of Sir John Pringle from the presidency of the royal society in 1777, Mr. Banks was chosen

to that office, which he held for 42 years. In 1781 he was created a baronet. Soon after, on the sudden death of Dr. Solander, he abandoned his purpose of publishing the results of his observations and discoveries in botany. In 1795 he received the order of the Bath, in 1797 was made a privy councillor, and in 1802 was chosen a member of the national institute of France. With the exception of brief memoirs or occasional communications to the transactions of societies, he published no account of his large collections on natural history, or of the results of his studies and observations. A small work on "Blight, Mildew, or Rust in Corn," and another on "Merino Sheep," are his only published books. He dispensed his large fortune with liberality, aiding in most of the scientific enterprises of his time, and relieving the necessities of scholars and travelers. The African association and the Botany Bay colony owed their origin to him. His immense library and scientific collections were bequeathed to the British museum.

BANKS, Nathaniel Prentiss, an American statesman and general, born in Waltham, Mass., Jan. 30, 1816. While a boy he worked in a cotton factory in his native village, of which his father was overseer, and afterward learned the machinist's trade. He devoted his leisure hours to study, and at an early age lectured before political meetings, lyceums, and temperance societies; he afterward became editor of the village paper of Waltham, and received an office under the Polk administration in the Boston custom house. About this time he was admitted to the bar, and in 1849 was elected to the house of representatives of Massachusetts. In 1851 he was chosen speaker of the house as one of the prominent advocates of the "coalition" between the democrats and the free-soilers, by which the ancient rule of the whigs was overthrown in Massachusetts. He was again elected the following year by the same combination, also representative to the ensuing congress. In the summer of 1858 he was president of the convention called to revise the constitution of the state. During his first term in congress he withdrew from the democratic party, and in 1854 was reelected with the support of both the "know-nothing" or American and republican parties, and in December, 1855, was adopted as the candidate of the latter for speaker. After a contest of more than two months, he was elected on the 133d ballot by a small plurality. He was a member of the next congress, and was nominated in separate conventions of the American and republican parties for the office of governor of Massachusetts, to which he was elected in November, 1857, and reelected in 1858 and 1859. In 1860 he succeeded Capt. G. B. McClellan as president of the Illinois Central railroad; but on the breaking out of the civil war, in 1861, he received a major general's commission, and was assigned to the 5th corps of the army of the Potomac, with his command

at first on the upper Potomac, and afterward in the valley of the Shenandoah. A portion of his troops fought with success at Winchester, March 23, 1862. On May 24 he was attacked by the confederate Gen. T. J. Jackson at Strasburg, and forced to retreat rapidly to the Potomac. As commander of a corps under Gen. Pope he fought the battle of Cedar Mountain, Aug. 9; and after participating in Gen. Sigel's movements in the valley of Virginia, in September he was put in command of the city of Washington. In December he succeeded Gen. Butler as commander of the department of the gulf, with his headquarters at New Orleans. In April, 1863, he captured Opelousas, and in July took Port Hudson, completing the opening of the Mississippi river. In the spring of 1864 he made an unsuccessful expedition up the Red river, and in May of that year was relieved of his command. He was elected to congress in his old district in November, 1864, and was reelected in 1866, 1868, and 1870, serving as chairman of the committee on foreign relations. In the canvass of 1872 he took an active part in favor of the election of Horace Greeley as president of the United States.

BANKS, Thomas, an English sculptor, born at Lambeth, Dec. 22, 1785, died in London, Feb. 2, 1805. His father gave him a good education, and then placed him under the instruction of Kent, the architect. In 1770 he won the gold medal of the royal academy. His group of "Mercury, Argos, and Io" fairly established his reputation. In 1772 he went to Rome as the academy's foreign student, and spent three years there studying the antique models and exercising his own talents. He produced several groups, among them "Caractacus pleading before Claudius," and "Psyche and the Butterfly." The latter was purchased by the empress Catharine II., who invited him to visit St. Petersburg, where he was cordially received and commissioned to execute a group called "Armed Neutrality." His masterpiece, the "Mourning Achilles," was placed in the British institution. Elected a member of the academy, he presented to that institution a fine figure of a fallen Titan. His most popular work was a monument representing the infant daughter of Sir Brooke Boothby.

BANKSIA, a name given to several distinct genera of plants in honor of Sir Joseph Banks. The one to which the name properly applies belongs to the family of *proteaceae*, and was named by Linnæus in honor of its discoverer, who accompanied Capt. Cook in his second voyage. The genus comprises several species, nearly all natives of Australia and the neighboring islands, where their beautiful forms and foliage are a conspicuous part of the landscape. The colonists consider their presence a mark of bad land. The leaves are hard, often broad, and closely cover the branches; the flower and fruit are in compact blunt cones, usually downy or woolly, and the flowers project so as to form a spike. As ornamental shrubs the

ankas have been much cultivated, and they will bear the climate of the southern states of England with slight protection. All are easily propagated from seeds. The banksia of

Banksia speciosa.

order is to be referred to the genus *pinnata*; that of König to *castus*, a genus of the ginger family; and that of Bruce to *Brayera*, a genus of *rosaceae*. The last, under the name of cusso, was found by the distinguished African traveler in the high country of Abyssinia, where a decoction of its leaves was used commonly as an anthelmintic.

BANNACKS, *Bannacks*, or *Pannagass*, a tribe of Indians of the Shoshonee family scattered over several of the territories and states of the Union. They were first found in the almost desert lands between the Saptin river and Salt lake, and between the Blue and Rocky mountains. At an early period they obtained horses and resorted to the bison plains and more fertile spots, and thus became a more closely connected tribe than Indians on foot. They are proud, brave, fine-looking men, though their women are represented as ugly. Those with the eastern Shoshonees, long under a friendly chief, Tahjee, have always been friendly to the whites. With the others there were for a time hostilities in 1866. They frequent the Yellowstone country to hunt, and range through northern Utah, Wyoming, southern Montana, Nevada, and Idaho. The two chief bands number apparently about 400 each, though in the ordinary returns some appear to be enumerated over again in different agencies. Their language is a dialect of the Shoshonee, but differs considerably from that of the Shoshonees proper. They have recently been placed on reservations where there is but little fish or game, and where they have been exposed to attacks from the Dakotas.

BANNERET, Benjamin, a negro mathematician and astronomer, born at Ellicott's Mills, Md., Nov. 9, 1781, died in October, 1806. His maternal grandmother was a white woman, who

liberated and married one of her slaves, and from her he learned to read and write. After his 50th year he commenced the study of mathematics and astronomy, and from 1792 till his death published almanacs prepared from his own calculations. Thomas Jefferson transmitted the first one in manuscript to the secretary of the Paris academy of sciences, and sent a complimentary letter to the author. Banneret assisted in running the boundary lines of the District of Columbia and in laying out the city of Washington. A book of his city calculations is preserved in the Maryland historical society at Baltimore, which association has published two sketches of his life.

BANNERET, a feudal title of military dignity, now extinct, ranking between the baron and the knight. The banneret was the lowest of the feudal dignitaries. He displayed a square banner on his lance, instead of the swallow-tailed pennon of the simple knight, and commanded a body of his own vassals, who should number at least 50. The title was usually conferred on the field by the king in person, as a reward for gallantry, and the ceremony consisted in cutting off the tails of the candidate's pennon. The title of knight banneret, a degree higher than the bachelor, appears in the time of Philip Augustus, and lasted until the creation of companies of ordnance by Charles VII. The first banneret in England, according to Froissart, was created by Edward I. After the institution of baronets by James I. the order dwindled away, and the last creation in England is generally accounted to have been by Charles I., who made Capt. John Smith a banneret for rescuing the royal banner at Edgahill; though George III. attempted to revive the dignity in 1797, when he conferred it upon Capt. Sir Henry Trollope, in whose ship he reviewed the fleet at the Nile.

BANNOCKBURN, a village of Stirlingshire, Scotland, about 8 m. S. E. of Stirling castle; pop. about 2,700. The large brook (burn) which flows through the town and gives it its name falls into the frith of Forth, and is said to have been named from the oaten cakes (bannocks) so common in that region. The town is the seat of woollen manufactures, and has long supplied the tartans worn by the Highland regiments of the British army. A battle was fought here, June 24, 1314, between the Scots under Robert Bruce and the English under Edward II. Edward, with nearly 100,000 men, including the flower of the English nobility, was met at Bannockburn by Bruce with about 30,000 men, and after a fierce contest was routed with a loss of 20,000. By this battle the independence of Scotland was secured, and Bruce was firmly seated upon the throne. Near the same place, at Sanchieburn, James III. was defeated by his rebellious subjects in 1488, and was assassinated in a mill near by, where he had taken refuge. The "bore stone" is still pointed out as the spot on which Bruce fixed his standard on the day of the battle.

BANNIS OF MATRIMONY, a public proclamation of the intention of the parties named to enter into the state of matrimony, being a notice to any one to make objection if he knows of any reason why the marriage should not take place. The term seems to be derived from the Teutonic *bann*, an interdict, whence to put under ban in the German empire was to excommunicate or declare outlawry. The custom is traced to the early Christians, who interwove it into their ecclesiastical polity. Its introduction into France dates from the 5th century, and in other parts of Europe it was probably adopted about the same time, or was coeval with the establishment of Christianity, as the laws regulating it are everywhere very similar. In the French and English churches they were identical, and required the proclamation to be made on three successive Sundays in church, during the celebration of public worship. The object of publication was to prevent clandestine marriages, or those which for various reasons are unlawful, as also the effect of precipitancy. In England the banns of a marriage to be celebrated according to the forms of the established church are required to be published three weeks previous to the marriage, a modification of the old custom of oral proclamation; but the parties may dispense with this by procuring a license from a person authorized to grant it. In Scotland three weeks' publication is necessary to a regular, as distinguished from a clandestine marriage; and also in France, by the provisions of the *Code Napoléon*. In the United States the tendency of legislation has been toward the repeal of all statutes requiring publication. In the Roman Catholic churches of this country, however, it is the rule to publish the banns on two Sundays previous to the wedding, when both the parties to the marriage are Catholics.

BANQUO, a Scottish thane and warrior of the 11th century, celebrated as the progenitor of the royal house of Stuart, through his grandson Walter, first lord high steward of Scotland. He was assassinated by Macbeth in 1066, after having joined him in his conspiracy against King Duncan; but Shakespeare, instead of making him Macbeth's accomplice, represents him simply as his victim.

BANSHEE, or *Banshee*, in popular superstition, an invisible being, supposed to announce by mournful presence and voice the approaching death of some members of certain ancient houses in Ireland and Scotland. It was said that, on the decease of a hero, the harp of his bards voluntarily emitted mournful sounds. In later times it was popularly supposed that each family had its banshee, which gave warning of misfortune or haunted the scenes of past troubles.

BANTAM. I. A Dutch province forming the western end of the island of Java, separated from Sumatra by the strait of Sunda; area, 3,081 sq. m.; pop. in 1857, 577,107. The coasts are level, but the interior districts mountainous,

and there are two active volcanoes, one of which, Karang, is 6,069 feet high. The chief productions are coffee, rice, sugar, indigo, tea, cinnamon, and bay salt. All of these, except rice and salt, are exotics. Pepper, which first attracted European adventurers, and made this country one of the most noted commercial points during the 17th century, is no longer cultivated. The wild animals include tigers, rhinoceroses, apes, and pigs. Cattle, buffaloes, and goats are extensively reared, and there are considerable fisheries on the coasts. The mass of the population of Bantam are of the Sunda nation, and speak its peculiar language; but on the coast they are mixed with Malays, Javanese, and others who speak Malay. Bantam was an independent state under a sultan prior to the Dutch dominion. It was first visited by the Portuguese, under Henrique Lemé, in 1511. The Dutch, under the two brothers Houtman, came in 1596; and one of the brothers was captured and held prisoner for some time by the sultan. The English made their first appearance here in 1602, and were engaged in almost constant hostilities with their European rivals, but the English and Portuguese were finally driven out by the Dutch. For a long time the district was held as a sort of dependency by the Dutch East India company until 1843, when the last of its rajahs was banished to Surabaya, at the further end of Java, and the country made a province. There are 41 small islands and islets, chiefly in the strait of Sunda, which belong to the government of this province. II. A town, formerly capital of the above described province, situated at the head of a bay on the N. coast of the island, 15 m. from the strait of Sunda and 61 m. W. of Batavia; lat. 6° 2' S., lon. 106° 9' E. Before the arrival of Europeans it was a prosperous city with a rich trade in pepper. The Portuguese, English, and Dutch each had a factory here. The capital, however, was in 1816 removed to Sirang, some miles inland. The trade has gone to Batavia, the harbor has been obstructed by the increase of coral reefs and deposits from the rivers, and since the destruction of most of the houses by fire in 1817 the town has not been rebuilt.

BANTING, William, a London merchant, born in 1797, died in 1871. Owing to the wide circulation of his "Letter on Corpulence," published at first in 1863 in the newspapers, and subsequently in a pamphlet (6th ed., London, 1868; German translation, 10th ed., Leipzig, 1867), his name has been popularly associated with a dietetic method of curing corpulence. His prescriptions, however, are almost identical with those of Brillat-Savarin in his *Physiologie du goût* (1825). By the application of the method which he describes, under the guidance of William Harvey, a London surgeon, his weight was reduced from 312 pounds on Aug. 26, 1862, to 156 on Sept. 12, 1863, and to 150 in April, 1864, which latter weight he regarded as appropriate to his age

and stature, 5 feet 5 inches. He considers the diet as the principal point in the treatment of corpulence, though the quantity of food may be safely left to the natural appetite. The dieting method consists in the use of a large proportion of nitrogenous food, and in the rejection of all substances which have an excess of carbon. His main principle consequently is abstinence from all farinaceous, saccharine, or oily matter, which is converted into fat in the human system. He especially prohibits the use of bread, pastry, potatoes, butter, milk, beer, port wine, champagne, pork, herrings, eels, salmon, and the like; and recommends lean meat, poultry, game, fruit, dry toast, good claret, dry sherry, madeira, and green vegetables, permitting the moderate use of soft-boiled eggs and cheese. In his dietary he first allowed the use of all vegetables excepting the potato, but afterward rejected turnips, beets, turnips, and carrots. He had for many years tried bodily exercise, sea-bathing, and various other expedients and remedies; but only after the adoption of his dietetic system was he relieved from all symptoms of acidity, indigestion, and heartburn, and difficulties of locomotion, and enabled to dispense with knee bandages, which he had worn during 20 years. He rested well, with from six to eight hours' sound sleep. He spent much money for the diffusion of his views, and is said to have left a legacy for the endowment of an institution for the cure of corpulence.

BANTRY BAY, an inlet of the Atlantic on the S. W. coast of Ireland, county Cork, about 24 m. long from S. W. to N. E. and from 8 to 5 m. wide. Near the entrance, on the N. W. shore, is a harbor deep enough for the largest ships, called Bear Haven, sheltered by Bear island. Near the head of the bay, on the opposite shore, is the town of Bantry, 44 m. W. S. W. of Cork, with a roadstead protected by Whiddy island, which has three circular redoubts; pop. about 1000. The town has an export trade in agricultural produce. In Bantry bay, in 1689, the French fleet which brought James II. to Ireland was victorious in an engagement with an English fleet under Admiral Herbert. It was here the place determined on as a rendezvous for the naval forces with which the French designed to invade England in 1796. The scenery

around the bay is very picturesque. Near the N. shore, about 6 m. N. N. E. of Bear Haven, is the cataract of Hungry Hill, which pours down in a series of cascades the waters of three small lakes from an elevation respectively of 1,011, 1,126, and 1,360 feet.

BANZ, probably the finest and richest abbey of the Benedictines known in history, situated in the circle of Upper Franconia, Bavaria, 3 m. from Lichtenfels, on the Main. It was founded about the middle of the 11th century, and the monks became celebrated for their scientific attainments, their collections in natural history, and their library. It was destroyed during the peasants' war in the 16th century, but was soon

Baobab Tree.

after rebuilt. During the 80 years' war it was again destroyed and rebuilt, and its library and museums became more extensive and valuable than ever. The monastery was broken up in 1802, and the library and cabinets were dispersed among several institutions of Germany. The building was sold to the elector (afterward king) of Bavaria, and is now a summer residence of the royal family.

BAOBAB (*Adansonia digitata*), a tree of enormous size, of the natural order *bombaceæ*, found in Africa, and especially in Senegal, though it has been met with on the banks of the White

Nile in the vicinity of the southern tropic. It was first discovered in 1748 by Adanson, in his voyage to Senegal, and it has been raised in England from seeds. It was carried to India many centuries ago, and one of great size is at Alipore near Calcutta. The trunk is from 15 to 60 ft. high and from 70 to 75 ft. in circumference. Its lower branches grow horizontally, frequently to the length of 60 ft., and hang to the ground, concealing the trunk. The leaves are large and abundant, of a dark green color, and divided into five radiating lanceolate leaflets; they are used by the natives as an antiseptic. The flower is large, white, with stamens gathered in a tube below, but spreading like an umbrella above, surmounted by a long, slender, and recurved style, terminated by a rayed stigma; petals reflexed and calyx deciduous. The fruit is a soft, pulpy, but dry substance, about the size of a quart bottle, enclosed in a long dull green woody pod; the pulp between the seeds tastes like cream of tartar, is used by the natives to give a flavor to porridge, and is much esteemed as an antifebrile. The baobab is also called monkey bread, sour gourd, and lalo plant. The natives make a strong cord from the fibres obtained from its pounded bark. To this end they often wholly strip the trunk of its bark, which is replaced by a new one. No external injury, not even fire, can destroy it from without, nor can it be injured from within, as it is quite common to find it hollow. Even cutting down does not exterminate it, for it continues to grow in length while lying on the ground, and its roots, which reach 40 or 50 yards from the trunk, retain their vitality. Livingstone judged that one of the baobab trees which he examined was at least 1,400 years old. It is subject to a very remarkable disease, a softening of its woody structure, until it falls by its own weight a mass of ruins. The natives use the trunk hollowed out as a place of deposit for executed criminals whom the law denies the rights of burial. In this position the bodies soon wither and dry up, having much the appearance of mummies.

BAPAUME, a town of France, in the department of Pas-de-Calais, situated in a wide plain, 13 m. S. E. of Arras; pop. in 1866, 3,174. It has several oil and soap manufactories. On Jan. 3, 1871, after some fighting on the preceding day in the vicinity, a battle took place at Bapaume between the French army of the north under Faidherbe, advancing for the relief of Paris, and a portion of the first Prussian army under Von Goeben. The French were repulsed, and on the next day fell back on Arras and Douai. The particulars of the battle became the subject of an animated controversy between Faidherbe and Von Goeben.

BAPHOMET, or *Baffomet*, a mysterious symbol used among the knights templar. The word was believed to be a corruption of Mahomet, to whose faith the templars were accused of

inclining. According to more recent views, it had reference to Gnostic mysteries, and was connected with the Gnostic baptism, or baptism of fire. Some of these curious symbols were found in 1818 in the imperial museum of Vienna, and described by Von Hammer. They are of stone, and represent a female figure with two male faces, inscribed with a serpent, a truncated cross, or Egyptian key of life and death, the sun and moon, a chess-board, a candlestick with seven branches, and numerous Arabic inscriptions.

BAPTISM (Gr. *βάπτισμα*, from *βαπτίζω*, frequentative of *βάπτω*, to dip), the application of water as the sign of reception of a person into the visible Christian church. As to the mode, it is admitted by all orders of Christians that immersion is a valid form, while the Baptist denomination, with its various branches, maintain that this is the only valid form. The Latin church favors affusion three times applied, in the names of the three persons of the Trinity; it however admits of either immersion or sprinkling. The original rubric of the Greek church requires a trine immersion, but in the Russian branch sprinkling is held equally valid. The rubric of the church of England requires that an infant be dipped three times in water, unless the health of the child renders it unadvisable. Protestant denominations, other than Baptists, recognize either mode; among them immersion is rare, affusion not uncommon, but sprinkling more usual. In the Greek and Latin churches the rite is administered at a very early age, practically as soon as the physical condition of the recipient will permit. The proper time is generally held to be from a week to a month after birth; but when there is supposed to be danger of death, it may be administered at once. By many Protestant denominations who recognize the baptism of children, only those are to be baptized one or both of whose parents are members of the church. Baptists maintain that the rite can only be administered upon profession of faith by the recipient, and therefore only to those who have reached a sufficient age to make such profession intelligently. In the case of infants, the Greek, Roman, and Anglican churches require sponsors, who promise in the name of the child obedience to the divine law. In the Latin church sponsorship is held to constitute a kind of affinity, so that sponsors are not allowed to intermarry. In the Lutheran church the parents may be sponsors. In the dissenting bodies in England, and in most of the non-episcopal churches in the United States, sponsors are usually dispensed with. The Latin church recognizes as valid baptism performed by any person, even by a midwife, upon a new-born child; but except in peril of death, the minister should be a clergyman. Baptism is only to be administered once. Baptists immerse all new postulants. The Roman church recognizes all baptisms as valid, but administers to converts what is sometimes

styled "conditional baptism," in cases where there is any doubt as to the fact of the person having been before baptized.—The Latin church holds baptism to be a sacrament by which all previous offences, including the taint of original sin, are washed out, so that the person baptized stands free from all sin, whether actual or original, up to the time of baptism. Many Protestant denominations maintain that it is merely a ceremony of initiation into church membership. Between these two extremes lies every possible shade of sentiment. The general idea of different churches respecting the ordinance of baptism may be best expressed in the words of their own formularies. The idea of the Latin and Greek churches is clear: baptism is a washing out of all previous sin; the person baptized commences thenceforth a new life. Article xxvii. of the Anglican and of the American Episcopal church reads: "Baptism is not only a sign of profession and mark of difference whereby Christian men are discerned from others, but it is also a sign of regeneration, or new birth, whereby, as an instrument, they that receive baptism rightly are grafted into the church: the promises of the forgiveness of sin, and of our adoption to be the sons of God by the Holy Ghost, are visibly signed and sealed; faith is confirmed, and grace increased by virtue of prayer unto God. The baptism of young children is in any wise to be retained in the church as most agreeable with the institution of Christ." The Augsburg Confession says that baptism is "a necessary ordinance, a means of grace, and ought to be administered also to children, who are thereby dedicated to God and received into his favor." The Westminster Confession affirms that it is "a sacrament of the New Testament, ordained by Jesus Christ, not only for the solemn admission of the party baptized into the visible church, but also to be unto him a sign and seal of the covenant of grace, of his ingrafting into Christ, of regeneration, of remission of sins, and of his giving up unto God, through Jesus Christ, to walk in newness of life; which sacrament is, by Christ's own appointment, to be continued in his church until the end of the world. Not only those that do actually profess faith in and obedience to Christ, but also the infants of one or both believing parents, are to be baptized. Although it be a great sin to contemn or neglect this ordinance, yet grace and salvation are not so inseparably annexed unto it as that no person can be regenerated or saved without it, or that all that are baptized are undoubtedly regenerated." In article xvii. of the Methodist Episcopal church, it is declared that "baptism is not only a sign of profession, and mark of difference whereby Christians are distinguished from others that are not baptized, but it is also a sign of regeneration or the new birth. The baptism of young children is also to be retained in the church." The Baptist churches in America, being congregational in form, have no abso-

lutely fixed formula. Two not very dissimilar ones are generally accepted, the "New Hampshire Confession of Faith" in the north, and the "Philadelphia Confession" in the south. The article on baptism in these two confessions is essentially the same, varying only in phraseology. In the Philadelphia Confession article xxii. reads: "Baptism is an ordinance of the New Testament, ordained by Jesus Christ to be unto the party baptized a sign of his fellowship with him in his death and resurrection; of his being ingrafted unto him; of remission of sins; and of his giving up unto God, through Jesus Christ, to live and walk in newness of life. Those who do actually profess repentance toward God, and obedience to our Lord Jesus Christ, are the only proper subjects of this ordinance. The outward element to be used in this ordinance is water, wherein the party is to be immersed in the name of the Father, and of the Son, and of the Holy Ghost."

BAPTISTERY (Gr. *βαπτιστήριον*), originally, a bathing place or swimming bath; later, and in ecclesiastical usage, a place set apart for per-

Baptistery at Novara.

forming the rite of baptism. At first the baptistery was an *exedra* or structure outside of the proper church; later the porch, and still later a part of the consecrated edifice, was so employed. As separate edifices, several baptisteries, notably those at Rome, Florence, and Pisa, are fine structures. The baptistery at Novara is one of the most curious buildings of this class, being largely composed of the remains of an ancient Roman temple, with an antique urn for a baptismal font. The introduction of the baptistery as a part of a church edifice dates from the 6th century. Ancient baptisteries were sometimes styled *φωτιστήρια*, either because baptism was considered as a *φωτισμός* or illumination, or because they were places where the catechumens were enlightened in the first

principles of the Christian faith. Occasionally also we find *κολυμβήθρα*, bath, and *piscina*, fish pond, used as synonymes for baptistery. Baptistery is now commonly used to designate the baptismal font in Catholic and Episcopal churches, and the tank in which the rite of immersion is performed in Baptist churches, where convenient access cannot be had to a natural body of water. A baptistery in the latter sense may be either within or without the church edifice to which it pertains.

BAPTISTS, a denomination of evangelical Christians, who differ from others in respect to the proper age and mode of administering baptism. In the view of the Baptists age is nothing, but spiritual qualification is everything; hence they baptize all who repent and believe the gospel, whether in childhood, youth, or manhood, and very frequently whole households at once, as did the apostles. The Baptists reject the substitution of sprinkling for the entire immersion of the body, which they maintain was originally practised in the administration of baptism, and (except in the case of the sick) universally observed throughout Christendom for 1,800 years. For the universal obligation of immersion as identical with baptism itself, and essential to its specific spiritual purposes, they urge the admitted signification of the word *βαπτίζω*, the necessity of adhering to the ordinary meaning of words in the interpretation of laws, the places where the rite was originally performed, the phraseology employed in describing it, the example of Christ himself, and the metaphorical allusions of the sacred writers when explaining the spiritual import of the rite. They maintain that, so far as the meaning of the word is concerned, they have the concurrence of the whole body of the reformers of the 16th century, who were withheld from restoring immersion among Protestants generally, not by critical reasons, but by their views of church authority and expediency. The Mennonites, or Dutch Baptists, restored immersion; but a part of them, though still rejecting infant baptism, have since adopted pouring; those who retain immersion are now called Tunkers, i. e., dippers. All the Greek and oriental churches, though adopting the baptism of children, retain immersion as essential to the validity of the rite, and deny that there is any efficacy in the western form of baptism.—On the subject of church communion strict Baptists agree generally with other denominations that it is not proper before baptism. Open communion, so eloquently advocated by Robert Hall in England, the Baptists of the United States regard as an anomaly. The Baptists believe in the spiritual unity of the whole believing church under Christ, its head, and in the duty of making this duty visible by subjection to him in all things. Local churches, like those of Jerusalem and Antioch, composed of converted members, duly baptized, embodied under the law of Christ by free mutual agreement, and maintaining the truth in

love, they hold to be, according to the New Testament, the appointed means, in the first place, for manifesting this unity. The government of these churches is congregational. Each body, being immediately dependent on Christ, is therefore independent of all others, and is complete in itself for the management of its internal affairs, such as the choice of officers, declaration of faith, and reception, dismissal, or discipline of members. Each church is a tribunal, where Christ himself presides, ratifying in heaven whatever is done according to his will on earth. This principle of independence is, however, balanced by the intercommunion of churches. This intercommunion is the highest form of visible unity, and is never to be interrupted without necessity. On this principle their churches associate, invite councils for advice, and organize societies for mutual coöperation in any benevolent, educational, or missionary enterprise. But all such associations among Baptists disclaim the slightest jurisdiction over the churches.—Baptists make no distinction but that of office between clergymen and laymen. The voice of the majority governs. They recognize no higher church officers than pastors and deacons. Elders, as evangelists and missionaries, are also ordained after due trial, and sent out to preach the gospel. Councils are usually called by the churches, to advise and assist in the ordination of ministers, the formation of churches, and the settlement of serious difficulties. Such councils in some localities are composed exclusively of ministers, and are called presbyteries; but they must not be confounded with the bodies that bear that name in the Presbyterian church, as they have neither judicial nor appellate powers. Whatever be their differences in other things, Baptists all agree in maintaining the congregational form of church government. With Congregationalists, so called, they differ only in regard to baptism and in being more strictly congregational.—In Great Britain the Baptists, next to the Congregationalists, form the most numerous body of Protestant dissenters. In England the body is divided by their views of the design of Christ's redemption into General and Particular Baptists, the former taking Arminian and the latter Calvinistic ground. The New Connection of General Baptists seceded from the old, to exclude Unitarianism, which was creeping in. They were originally strict communionists, but are now divided on that question. They have a theological school at Leicester, a successful mission at Orissa in India, and, though a small, are a zealous and flourishing body. The Particular Baptists are altogether the most numerous and influential. They have in Great Britain and Ireland 2,567 churches and 243,005 members. They have six theological colleges—at London, Bristol, Horton, Haverford West, Pontypool, and Edinburgh. Their periodical organs are the "Freeman," a large weekly sheet, and three monthly periodicals, the "Baptist Magazine," "Baptist Reporter," and the

"Eclectic Review." This body holds different views on the question of communion; the prevailing ones are those of Robert Hall. In all other respects they are united. Within half a century they have advanced rapidly in numbers and influence. They support the important mission to India begun by Carey in 1793, a Baptist home mission, and missions in Ireland, France, Africa, Honduras, and the West Indies. The Jamaica mission is now self-supporting, but the home society has established and sustains at Calabar, in Jamaica, a theological institution for native candidates for the ministry, which is in a flourishing condition, and promises much for Africa also. Baptist principles are spreading rapidly in all the widely extended colonies of Great Britain, particularly Australia, New Zealand, St. Helena, New Brunswick, Nova Scotia, and the Canadas. On the continent of Europe, within 35 years, nearly 80,000 converts have been baptized, and 100 churches planted in the principal cities of France, Switzerland, Germany, and Denmark, besides 220 churches in Sweden, with 8,807 members. Many of these converts have suffered severe fines and imprisonments; some have been denied the liberty of marriage; others have had their children forcibly baptized in the state church; others, still, have been condemned to perpetual banishment. But in the face of all this intolerance they have advanced. Hundreds, driven from their homes, emigrate to America. Recent information from France and Switzerland announces the gradual abandonment of infant baptism by the free evangelical churches, and also by some in the Protestant national church.—In the United States the Baptist, with one exception, is now the largest denomination of evangelical Christians. They are spread through every state and territory. Owing to a difference on the subject of slavery, in 1845 the southern Baptists, by mutual consent, formed separate organizations for their benevolent enterprises. As early as 1764, when numbering in all America only 60 churches and about 5,000 members, the Baptists founded their first college in Rhode Island. Long before, they had fostered Harvard, and helped Franklin to lay the foundations of the university of Pennsylvania. They now have 28 colleges of their own, over 100 academies and female seminaries of a high grade, and 9 theological schools. They have publication societies at Philadelphia, Charleston, and Nashville, besides many flourishing private publishing houses in our large cities. They maintain 45 periodical organs, including a quarterly review. The Baptists of the United States also support the American and foreign Bible society, the American Baptist missionary union, the southern Baptist board of foreign and domestic missions, the Baptist home mission society, and in part the "American Bible Union." Their missions are planted in Canada, Oregon, California, New Mexico, Hayti; in France, Spain, Germany, Denmark, Sweden,

Norway; in western and central Africa; in southern India, Assam, Burmah, Siam, and China. The number of conversions from their colportages and missions in 1871 exceeded 5,000. Total number in the mission churches, over 50,000. The income of all the above societies in 1871 was \$800,000. In doctrine the Baptists of this country are Calvinistic, but with much freedom and moderation. The New Hampshire declaration of faith in 1838 is the most popular.—Besides the general body of Baptists, there are in the United States nine smaller bodies, distinguished by peculiarities indicated by their respective names. The Seventh-Day Baptists differ only in the observance of the Jewish Sabbath; the Free-will and the Antimission Baptists are seceders from the general fellowship on account of Arminian and Antinomian tendencies, though the latter are gradually adopting different views and returning to the general body. The General (or Six-Principle) Baptists, the Tunkers, and the Mennonites are of foreign origin, and cling to their ancient usages. The Christian connection, the Campbellites (or Disciples), and the Winebrennarians (or Church of God) are new organizations, drawn from various sources, though agreeing with the Baptists generally as to the subjects and mode of baptism. For the peculiarities of each see the respective articles.—It is asserted by some Baptists that they can trace their history in a succession of pure churches (*cathari*) essentially Baptist, though under various names, from the 3d century down to the reformation. These churches, from the 5th century onward, were the subjects of systematic persecution from the state churches, both in the East and in the West. Cyril of Alexandria and Innocent I. of Rome, according to the historian Socrates, began this persecution by depriving them of their houses of worship, and driving them into secret places, under the laws of Honorius and Theodosius II., which forbid rebaptism (so called) under penalty of death. Yet their principles reappear among the Culdees of the West and the Paulians of the East, the Vallesii and the Paterines, the Albigenes and Waldenses, and emerge on all sides at the first dawn of the reformation. Mr. Bancroft says of the German Baptists of that era: "With greater consistency than Luther they applied the doctrines of the reformation to the social positions of life, and threatened an end to priestcraft and kingcraft, spiritual domination, titles, and vassalage. They were trodden under foot with foul reproaches and most arrogant scorn, and their history is written in the blood of thousands of the German peasantry; but their principles, secure in their immortality, escaped with Roger Williams to Providence, and his colony is witness that naturally the paths of the Baptists are paths of freedom, pleasantness, and peace." (See ANA-BAPTISTS.)—In England, from the time of Henry VIII. to William III., a full century and a half, the Baptists struggled to gain their footing,

and to secure liberty of conscience for all. From 1611 they issued appeal after appeal, addressed to the king, the parliament, and the people, in behalf of this "soul liberty," written with a breadth of view and force of argument hardly since exceeded. Yet, until the Quakers arose in 1660, the Baptists stood alone in its defence, amid universal opposition. In the time of Cromwell they first gained a fair hearing, and, under the lead of Milton and Vane, would have changed the whole system of the church and the state but for the treason of Monk. In the time of Charles II. the prisons were filled with their confessors and martyrs, yet their principles gradually gained ground in the public mind and hastened the revolution of 1688. "The share which the Baptists took," says Dr. Williams, "in shoring up the fallen liberties of England, and in infusing new vigor and liberality into the constitution of that country, is not generally known. Yet to this body English liberty owes a debt it can never acknowledge. Among the Baptists Christian freedom found its earliest, its staunchest, its most consistent, and its most disinterested champions." Not less powerful has been the influence of the Baptists in the United States. Introduced into Rhode Island with Roger Williams and John Clark in 1638, their history for more than a century, in most of the colonies, is that of proscribed and banished men. Yet, persecuted themselves, they never persecuted others. "In the code of laws established by them in Rhode Island," says Judge Story, "we read, for the first time since Christianity ascended the throne of the Cæsars, the declaration that conscience should be free, and men should not be punished for worshipping God in the way they were persuaded he requires." The article on religious liberty in the amendments to the American constitution was introduced by the united efforts of the Baptists in 1789. The new impulse given to the spirit of liberty by the revolutionary war was followed by the rapid spread of Baptist principles. Their great prosperity dates from that era. In 1762 there were 56 Baptist churches in America; in 1792 there were 1,000; in 1812, 2,433; in 1832, 5,322; in 1852 they exceeded 9,500. At the present time, according to the "Baptist Year Book" for 1872, without including any of the Baptist minor bodies, there are 18,397 churches, 12,013 ministers, and 1,489,181 church members, of whom 85,321 were added the preceding year. Including those of the British provinces, the total number of members was 1,557,449. If those sects be included which agree with the Baptists in their organic principles, though differing in other points, the number would rise to more than 1,700,000. The total population attached to Baptist views is estimated at nearly 8,000,000. From these statistics it appears that the increase of the Baptists far outruns that of the population of the United States. The rates of increase have been greatest in Massachusetts and Virginia,

where they were most persecuted, and in the new states where their zealous ministers were among the earliest pioneers. (See Curtis's "Progress of Baptist Principles for the last One Hundred Years," Boston, 1856.)

BAR. See **BAR-LE-DUC**, **BAR-SUR-AUBE**, and **BAR-SUR-SEINE**.

BAR, a town of S. W. Russia, government of Podolia, on the Rov, 53 m. N. E. of Karne-netz; pop. in 1867, 8,077. It is famous as the place where a confederation of Polish patriots was formed, chiefly under the lead of the Palaskis, with a view to combating Russian influence and the adherents of Russia in Poland, Feb. 29, 1768. The Russians took Bar by storm on the following May 28, together with 1,400 men and 20 pieces of cannon.

BAR. I. An enclosure made by a railing or partition for the use of counsel in courts, and to prevent their being incommoded by spectators; from whence is sometimes supposed to have come the term barrister, applied to those called within the bar. At this bar prisoners were placed for trial. The term is used collectively to designate those who as counsel are entitled to address the court. II. A low partition which in the houses of parliament and legislative halls generally separates from the body of the house a space near the door, beyond which none but members, clerks, and messengers are admitted except on leave. Persons charged with contempt are brought to the bar of the house; and at the opening and close of a session of parliament the commons go to the bar of the house of lords to hear the queen's speech.

BARABA, a steppe of Siberia, 800 m. from E. to W. and 450 from N. to S., comprising the S. E. part of the province of Tobolsk, and the S. W. portions of Tomsk. The Altai mountains enclose it on the south, and the Irtysh and Obi rivers on the west and east. Certain districts are fertile, and there are extensive forests; but the whole region abounds in swamps and salt lakes, the waters of which become poisonous during the summer. The inhabitants consist of Russian colonists living in villages, and of Barabintzi, a small tribe of Tartar origin, who are chiefly nomadic shepherds or fishermen.

BARACOA, a seaport town of Cuba, in the Eastern Department, capital of a district of the same name, on the N. E. coast, 100 m. E. of Santiago de Cuba; pop. about 5,500. It is on the E. side of a small but deep harbor, on a rocky bluff of coral formation; and back of the town are high, craggy mountains of curious shape, the highest of which is called the Anvil of Baracoa. The houses are well built of adobe and surrounded with fine gardens. An unusually large quantity of rain falls at Baracoa, and the forests and large orchards of cocoanut palms in the vicinity are very luxuriant. It is the centre of a large fruit trade with the United States; limes, oranges, lemons, pineapples, and cocoanuts are brought in from the surrounding country on mules and donkeys. The trade in

coconuts is said to average 50,000 a day. Cigars only are manufactured. Columbus landed here, and the first settlement on the island was made here in 1512 by Diego Velazquez.

BARADA, a river of Syria, probably the Biblical Abana, called by the Greeks the Chrysorhoas or Bardinea. It rises in the Anti-Libanus, flows S. E., and falls into the Bahret-el-Kibliyah, a lake or swamp, E. of Damascus. Issuing from a cleft in the mountains as a clear rapid stream, it divides into three smaller courses. The central or main stream runs straight to the city of Damascus, supplying the baths and fountains of that city. The other branches diverge to the right and left, and, after irrigating the plain, reunite with the main stream. The water of the Barada, like that of the Jordan, is of a white sulphurous hue, and has an unpleasant taste.

BARAGI, Frederick, D. D., a Roman Catholic bishop and missionary among the North American Indians, born at Treffen, Carniola, June 29, 1797, died at Sault Ste. Marie, Jan. 19, 1868. He was of a noble family, was educated at the university of Vienna, was ordained a priest in September, 1828, came to America in December, 1830, and from that time till his death was connected with the Chippewa and Ottawa missions in Michigan. He was consecrated bishop of Marquette and Sault Ste. Marie in 1858. He was the author of a Chippewa grammar and dictionary (Detroit, 1849 and 1852), of several religious works in Chippewa, and of a small work in German on the "History, Character, and Habits of the North American Indians" (1857).

BARAGUEY D'HILLIERS, L. Louis, a French general, born in Paris, Aug. 18, 1764, died in Berlin in December, 1812. At the beginning of the French revolution he was lieutenant in the regiment of Alsace, was appointed brigadier general in 1798, and chosen by Custine as the head of his staff. His fidelity to that unfortunate chief led to his imprisonment, but he was liberated after the 9th Thermidor. He served under Napoleon during his first two campaigns in Italy, and was promoted to the rank of division general. He distinguished himself at Stuttgart and Elchingen and on the frontiers of Bohemia, was governor of Friuli in 1806, of Venice in 1808, and participated in the victory of Raab won by Eugène Beauharnais over the Austrians in June, 1809. During the following two years he served in Spain. In 1812 he was put in command of a division of the grand army against Russia, and was captured with nearly all his forces by the enemy. A court of inquiry was ordered by Napoleon, at which he was so aggrieved that he fell sick and died before he reached France. **II. Achille**, marshal of France, son of the preceding, born Sept. 6, 1795. He served as second lieutenant during the Russian campaign, became in 1813 aide-de-camp to Marshal Marmont, and at the battle of Leipzig had his left hand carried away by a cannon ball. He was

full of the empire, though not yet 20 years old. Adhering to the restored Bourbons, he entered the royal guards, served in Spain and Algeria, became second in command at the military school of St. Cyr in 1832, and afterward principal, a position which he held till 1840. For some years thereafter he served with some distinction in Algeria and became a general. Returning to France in 1847, he was appointed inspector general of infantry. After the outbreak of the revolution of 1848, he was appointed chief of the second division of the army near the Alps. He was elected to the constituent assembly from the department of Doubs, and joined the party of reaction. In 1849 he went to Rome as commander-in-chief of the army sent to sustain the authority of the pope, and in 1851 was put in command of the army of Paris in place of Gen. Changarnier, whom Napoleon distrusted. He favored the *coup d'état*, and was made a member of the consultative commission. In the Crimean war he commanded the expedition to the Baltic, and on his return was made a marshal and became one of the vice presidents of the senate. He commanded the first army corps in the Italian campaign of 1859, and took a prominent part in the battle of Solferino. In 1868 he was in command of the camp at Châlons, and shortly after the outbreak of the war of 1870 was for a few days military governor of Paris.

BARANOFF, Nikolai, a deaf-mute Russian painter, born in Esthonia in 1810. He studied in Berlin at the expense of the czar, and has produced genre and historical pictures.

BARANOFF, Alexander Andreyevitch, governor of the Russian possessions in North America, born in 1746, died at sea, near the island of Java, April 28, 1819. Early in life he was engaged in commerce in western Siberia, but in 1790 established himself at Kadink, and opened a trade with the natives. In 1796 he founded a commercial colony on Behring strait, and in 1799 took possession of the largest of the Sitka group of islands, now known by his name. He built a large factory at Sitka, and opened commercial relations with Canton, Manila, Boston, New York, California, and the Sandwich Islands, founded a colony near San Francisco, and was ennobled by the czar Alexander and made first governor of Russian America. He died while returning to Russia.

BARANTE, Amable Guillaume Prosper, baron de Bruglère, a French statesman and historian, born at Riom in Auvergne, June 10, 1762, died in Auvergne in 1866. He was educated at the polytechnic school in Paris, and occupied during the empire several offices at home and missions abroad. He was prefect of Loire-Inférieure on the fall of Napoleon, kept his post under the restoration, and after the hundred days became a member of the council of state and general secretary of the home department. In 1819 he was made a peer of France, and that most of his time was given to lit-

erary pursuits. As early as 1809 he had published anonymously his *Tableau de la littérature française au 18^e siècle*, and he was the real author of a great part of Mme. de la Rochejaquelein's *Mémoires* on the war in La Vendée. He published a French version of Schiller's dramas (1821), contributed to the *Collection des théâtres étrangers*, and furnished the "Hamlet" of Guizot's translation of Shakespeare. His *Histoire des ducs de Bourgogne de la maison de Valois* (3 vols. 8vo, 1824-'6), a skilful arrangement of the memoirs of old chroniclers, has been considered a model of purely narrative history, and secured his election to the French academy. After the revolution of 1830 he was appointed ambassador to Turin, and in 1835 he went as minister to St. Petersburg. After the revolution of 1848 he devoted himself wholly to literary pursuits. Among his remaining works are: *Mélanges historiques et littéraires* (3 vols., 1836); *Questions constitutionnelles* (1850); *Histoire de la convention nationale* (6 vols., 1851-'3); *Histoire du directoire* (3 vols., 1855); *Études historiques et biographiques* (2 vols., 1857); *La vie politique de M. Royer-Collard* (2 vols., 1861); and *De la décentralisation en 1829 et en 1833* (1865). As a historian Barante was impartial and accurate in his statements.

BARANYA, a county of S. W. Hungary, bounded by the Danube, which there forms Margitta island, and the Drave, which separates it from Slavonia; area, about 1,965 sq. m.; pop. in 1870, 283,506, of whom more than half are Magyars, and the rest chiefly Germans, Croats, and Serbs. The surface is partly hilly and partly level, and the soil almost everywhere very fertile, producing wheat, tobacco, fruits, and excellent wines. The county is also rich in cattle, sheep, and swine. There are several mineral springs. The most important towns are Fünfkirchen or Pécs, the capital, and Mohács, near which in 1526 Hungary lost her army, her king, and her independence.

BARATIER, Johann Philipp, a precocious German scholar, born at Schwabach, near Nuremberg, Jan. 19, 1721, died in Halle Oct. 5, 1740. He was the son of a Protestant pastor, who had fled from France on the revocation of the edict of Nantes. Before his 5th year he had learned to read and write French, German, and Latin, and he afterward mastered, almost unaided, Greek, Hebrew, Syriac, Arabic, and Ethiopic. In his 9th year he made a dictionary of difficult Hebrew and Chaldaic words, and in his 13th year published a translation from the Hebrew of the itinerary of Benjamin of Tudela, to which he added notes and historical dissertations. He also published several learned theological pamphlets, and made difficult mathematical and astronomical calculations. In his 14th year he received from the university of Halle the degree of master of arts, on which occasion he defended 14 theses in the presence of more than 2,000 spectators. The royal society of sciences at Berlin made him a member,

and the king of Prussia made him an annual allowance of \$50, presented him with books and mathematical instruments, and gave to his father a living at Halle. He began a history of the church, a history of the 30 years' war, and various other works.

BARATYNSKI, Yevgei Abramovitch, a Russian poet, died in Italy in September, 1844. He was educated at St. Petersburg, served eight years as a soldier in Finland, and afterward lived in Moscow. "Eda," the first offspring of his muse, is a spirited poem, with strong local coloring and Finnish characteristics. His most agreeable production is the "Gypsy," a graceful picture of the best features of Russian high life.

BARB, a fine breed of horses cultivated by the Moors of Barbary, and first introduced by them into Spain. They are believed to have been of a kindred origin with the Arabian horse, but are less remarkable for beauty and symmetry than for speed, endurance, and docility. They are generally larger than the Arabian, and the black barbs of Dongola are said to be rarely less than 16 hands high. The wild horses of America are believed to have descended from Spanish barbs, brought over by the early explorers.

BARBADOES, or Barbados, a British island of the West Indies, the most easterly of the Caribbean group, in lat. 13° 10' N., lon. 59° 32' W. It is of an oval form, 22 m. long and 14 broad; area, 166 sq. m.; pop. in 1861, 152,727, being 920 to the square mile. The population of Barbadoes is denser than that of any other country in the world except Malta. In 1861 there were 16,594 white, 86,118 of mixed race, and 100,005 black. The island is divided by a deep valley into two parts. Near the centre of the northern and larger part is Mount Hillaby, 1,147 ft. high. From the W. coast the ground rises in successive terraces, broken by ravines to the central ridge, from which hills of a conical form radiate in a N. E. direction to the seashore. The N. W. and S. parts of the island consist of rocks of coralline limestone with beds of calcareous marl; the E. part is composed of strata of silicious sandstone, intermixed with ferruginous matter, clay, marl, minute fragments of pumice, strata of volcanic ashes, seams of bitumen, and springs of petroleum. There are several chalybeate springs, containing chiefly iron, carbonic acid, and fixed alkali, in different proportions. The island is encircled by coral reefs, which in some parts extend seaward for three miles, and are dangerous to navigation. Carlisle bay, the port and harbor of Barbadoes, is a spacious open roadstead, capable of containing 500 vessels; but it is exposed to S. and S. W. winds. The climate, though warm, is salubrious. The island is greatly exposed to hurricanes. One of these, in October, 1780, destroyed almost every building, and 3,000 or 4,000 lives. During another in August, 1831, the loss of life is

Barbadoes.

stated to have been from 2,000 to 5,000, and the destruction of property £1,602,800. The principal articles of export are sugar, cotton, aloes, and arrowroot; the imports are chiefly fish, beef, flour, cutlery, and cloths. In 1850 the imports were £734,858, exports £831,534; in 1860, imports £976,800, exports £1,345,400; in 1870, imports £1,026,221, exports £935,425. There are only four towns, of which Bridgetown, the capital, has about 25,000 inhabitants. The government consists of a governor, council, and house of assembly. The governor, appointed by the crown, is also governor general of the neighboring islands of Grenada, St. Vincent, Tobago, Trinidad, and St. Lucia. The council consists of 12 members, appointed by the crown, who hold office during the royal pleasure. The assembly consists of 24 delegates, elected annually by the people.—Barbadoes was probably discovered early in the 16th century by the Portuguese. When it was first visited by the English in 1605, it was uninhabited and covered with dense forests. The first English colony, consisting of 40 whites and 7 negroes, was founded in 1625. In 1665 the Dutch made a fruitless attempt to seize the island. In 1676, 1692, 1816, and 1825, plots were formed among the negroes to take possession. In 1788 the population was 16,127 whites, 2,229 free colored, and 64,406 negroes. There appears to have been no increase in the white population for 75 years, while the colored or mixed portion has multiplied 15 fold. The abolition of slavery in 1834 was effected without disorder.

BARBARA, *Saint*, a virgin and martyr, honored in the Greek and Roman Catholic churches, and supposed to have suffered at Heliopolis in 306, or at Nicomedia in Bithynia in 235.

According to the *Aurea Legenda*, she was born at Heliopolis in Egypt, of pagan parents; and her father, fearing she should be taken from him on account of her great beauty, confined her in a tower. In her seclusion she heard of the preaching of Origen, and wrote to him begging for instruction, whereupon he sent one of his disciples, who taught and baptized her. On learning this her father put her to death, and is said to have been immediately struck by lightning; for which reason the saint has been regarded as the patron of sailors in a storm, and of artillerymen. In art she is generally represented with a tower. Her festival day is Dec. 4.

BARBARELLI, *Giorgia*. See *GIORGIONE*.

BARBAROSSA, the name given to two renegade Greek corsairs, and supposed to be a corruption of *Baba-raia*, father captain. I. *Arudj*, *Herash*, or *Horuk*, born at Mitylene (Lesbos) about 1474, executed in 1518. He acquired fame in the service of Egypt, Turkey, and Tunis, and with his brother became the terror of the Mediterranean. Invited by the emir of the Metidja, Selim Eutemi, in 1516, to aid him against the Spaniards, he made himself master of Algiers, Tenez, and Tlemcen, and murdered the emir, but was defeated by the troops of Charles V., besieged in Tlemcen, captured on his flight from that city, and put to death. II. *Khair-ed-Din*, brother and successor of the preceding, born about 1476, died in Constantinople in 1546. After his brother's death he obtained the assistance of the sultan Selim I. in recovering Algiers. Solyman I. putting him in command of his fleet, he fortified Algiers, and conquered Tunis and other territories for the Turks. After Charles V. retook Tunis in 1535, Barbarossa preyed upon the coast of

Italy, defeated Doria in the gulf of Ambracia, captured Castel Nuovo (1539), defeated a Christian squadron off Candia, threatened Doria at Genoa, joined Francis I. against Charles V., aided the French in taking Nice (1549), and made a triumphant entry into Constantinople with many thousand prisoners.

BARBAROSSA, Frederick. See **FREDERICK I.**, emperor of Germany.

BARBAROUX, Charles Jean Marie, a French revolutionist, born in Marseilles, March 6, 1767, guillotined at Bordeaux, June 25, 1794. He was a prominent young lawyer when in 1791 he was sent by his native city as revolutionary agent to the legislative assembly and was admitted to the Jacobin club. When it was feared that the court would succeed in arresting the revolutionary movement in the north of France, Barbaroux was vehement in supporting the plan of a separate republic in the south. He took, with his 500 countrymen, who were especially called *les Marseillais*, an important part in the insurrection of August 10, 1792, which led to the downfall of the monarchy. Elected a deputy to the convention, he joined the deputies of the Gironde, became by his zeal, eloquence, and rare personal beauty a conspicuous member of their party, opposed the merciless policy of Marat and Robespierre, and demanded an act of accusation against the promoters of the massacre of September. He manifested remarkable ability in the discussion of questions of finance, commerce, and the internal administration of the country; he strongly opposed several of the rash and unjust financial measures of the day, and suggested several plans for a more prudent management. At the trial of Louis XVI. he voted for the king's death, but favored an appeal to the nation. After the popular rising of May 31, 1793, which sealed the tragic fate of the Girondists, Barbaroux left Paris with some of his colleagues, and tried to raise an insurrection in the provinces against the convention; but this movement was soon suppressed, and Barbaroux, hunted from place to place, sought a refuge in the vicinity of Bordeaux. Being discovered, he shot himself twice; but though in a dying condition, he retained life enough to be sent to the scaffold by the revolutionary committee of Bordeaux.

BARBARY STATES, a general term designating that portion of northern Africa stretching from the W. frontier of Egypt to the Atlantic, and from the Mediterranean to the desert of Sahara, between lat. 25° and 37° N., lon. 10° W. and 25° E., and including Tripoli, Tunis, Algeria, and Morocco. The name is derived from the Berbers, the ancient inhabitants of the region, who still constitute a considerable portion of the population.

BARBASTRO, a town of Catalonia, Spain, on the Cinca, in the province and 26 m. S. E. of Huesca; pop. about 6,500. It is an old town, and has a fine cathedral with good medieval paintings, and an important school.

BARBAULD, Anne Letitia, an English writer, born at Kibworth-Harcourt, Leicestershire, June 30, 1743, died at Stoke-Newington, near London, March 9, 1825. She displayed unusual talent as a child, and her early education was directed with care by her father, the Rev. John Aikin, a Unitarian minister. At the age of 15 she removed with him to Warrington in Lancashire, where he took charge of the academy, out of which grew the central Unitarian college, afterward transferred to York, and finally established in Manchester. In 1772, at the age of 30, she published a volume of her poems, which the same year ran through four editions. This was followed by "Miscellaneous Pieces in Prose," partly written by her brother John Aikin. In 1774 she married the Rev. Rochemont Barbauld, with whom she kept a school for the next 11 years in the village of Palgrave, Suffolk. During this period she published "Devotional Pieces, compiled from the Psalms of David," "Early Lessons for Children," and "Hymns in Prose for Children." After a short visit to the continent in 1785-'6, Mrs. Barbauld went to live at Hampstead, near London, where her husband became pastor of a small congregation, and she took charge of a few pupils. Here she wrote several pamphlets and poems on popular subjects, such as the removal of the civil disabilities of the dissenters and the abolition of the slave trade, and various contributions to her brother's "Evenings at Home." In 1802 she removed with her husband to Stoke-Newington, and there passed the rest of her life. Here she prepared "Selections from the Spectator, Guardian, Tatler, and Freeholder," with a preliminary essay. She wrote the life of Richardson, the novelist, to accompany his correspondence, edited Akenside's "Pleasures of the Imagination" and Collins's "Odes," and a collection of the "British Novelists," with memoirs and criticisms, and published "The Female Spectator," a miscellany of prose and verse. Her last separate publication, "Eighteen Hundred and Eleven" (1812), is her longest and most highly finished poem. Her works, in two volumes, were edited, with a memoir, by her niece, Miss Lucy Aikin. Her writings are distinguished for their pure moral tone, simplicity, and earnestness, and her books for children are among the best of their class.

BARBEL (*barbus*, Cuv.), a large, coarse fresh-water fish, of the family cyprinidae, found in

many of the large European rivers. It has several barbs or beard-like feelers pendent from its leathery mouth, which are said to be the origin of its name. It frequents deep, still pools with eddies, in swift-flowing streams; roots in the gravel bottoms like a hog; and feeds on worms and other bottom bait. It grows to the length of 3 feet and to the weight of 18 or 20 pounds, is a determined biter, and, when hooked, a desperate puller. It is of little value as food.

BARBÉ-MARBOIS, François de, count and marquis, a French statesman, born at Metz, Jan. 31, 1745, died Jan. 14, 1837. After filling diplomatic offices at several German courts, he was sent to the new government of the United States of America as consul general of France. He organized all the French consulates in this country, and during his residence here married the daughter of William Moore, governor of Pennsylvania. In 1785 he was appointed by Louis XVI. intendant of St. Domingo, and introduced many reforms in the administration of justice and of finance. He returned to France in 1790, and, having vindicated himself from various accusations, was again employed in German diplomacy. In 1795 he was elected a member of the council of elders, but was soon charged with a variety of offences, and, though he defended himself with spirit, was in 1797 exiled to Guiana as a friend of royalty. He was recalled in 1801 and made director of the treasury, a title which he soon exchanged for that of minister of finance. In 1803 he was authorized to cede Louisiana to the United States for 50,000,000 fr., but had the skill to obtain 75,000,000 fr., a piece of diplomacy for which he was liberally rewarded by Napoleon. He was soon after made count of the empire and chief officer of the legion of honor. In 1806 a sudden decline in the funds caused by a blunder in his administration brought about his disgrace, which was however speedily ended by Napoleon, who recognized and needed his ability. In 1813 he entered the senate, and the next year voted for the deposition of the emperor and the reestablishment of the Bourbon dynasty. He was well received by Louis XVIII., appointed a peer of France and honorary counsellor of the university, and confirmed in the office of first president of the court of accounts, which he had formerly held. Napoleon after his return from Elba ordered him to leave Paris. He resumed his offices on the return of the Bourbons. After the revolution of July he took the oath of fidelity to Louis Philippe. He wrote *Réflexions sur la colonie de Saint-Domingue* (1796); *Complot d'Arnold et de Sir Henry Clinton contre les États-Unis d'Amérique et contre le Général Washington* (Paris, 1816); *De la Guyane* (1822); *Lettres de Madame la Marquise de Pompadour*, with a memoir (1811); *Histoire de la Louisiane et de la cession de cette colonie par la France aux États-Unis* (1828); and various other works.

BARBER, Francis, the negro servant and friend of Dr. Samuel Johnson, born in Jamaica, probably about 1741, died Feb. 13, 1801. He was taken to England in 1750, and sent to a boarding school in Yorkshire. In 1752 he entered Dr. Johnson's service, in which he continued till Johnson's death, with the exception of two intervals: in one of which, upon some difference with his master, he served an apothecary in Cheapside; and in another he took a fancy to go to sea. This last escapade occurred in 1759, and through Dr. Smollett's interference with John Wilkes, one of the lords of the admiralty, procured his discharge (in June, 1760), without any wish on the part of Barber. On returning, he resumed his situation with Dr. Johnson, who sent him to school for a time. It was owing to Barber's care that the manuscript of Johnson's diary of his tour in Wales in 1774 was preserved. Dr. Johnson gave Barber in his will an annuity of £70, and after the payment of a few legacies made him residuary legatee. Barber's whole income from this bequest amounted to about £140, on which, at Johnson's recommendation, he retired to Lichfield, and passed the rest of his days in comfort.

BARBER, Francis, an officer in the American revolution, born at Princeton, N. J., in 1751, died at Newburgh, N. Y., in April, 1788. He graduated at the college of New Jersey in 1767, and in 1769 became rector of the academy at Elizabethtown, N. J. He gained a very high reputation as a teacher, and had among his pupils Alexander Hamilton. At the commencement of the war he enlisted with his two younger brothers. In February, 1776, he received a commission as major of the 3d battalion of the New Jersey troops, in November of the same year was appointed lieutenant colonel of the 8d Jersey regiment, and in 1777 was named assistant inspector general under Baron Steuben. He served with his regiment under Gen. Schuyler in the northern army, and participated in the battles of Trenton, Princeton, Brandywine, Germantown, and Monmouth. In the last-mentioned action he was severely wounded, and compelled to retire to his home at Elizabethtown. There he made himself useful in obtaining intelligence of the enemy's movements. In 1779 he served as adjutant general in Gen. Sullivan's campaign against the Indians, and was wounded in the battle at Newtown. He was engaged in the battle of Springfield, and in 1781, when the mutiny of the Pennsylvania and New Jersey troops broke out, he was selected by Washington to suppress the revolt. He was present at the battle of Yorktown, and at the close of the war was with the army at Newburgh. On the day that he was invited by Washington to be present at a dinner to hear the news of the peace he was killed by a falling tree.

BARBERINI, an Italian family of Tuscany, who settled in Florence in the 11th century, and acquired wealth by trade in the 16th, and

historical importance early in the 17th century by the elevation of MAFFEO BARBERINI to the papacy under the name of Urban VIII. His brother ANTONIO became cardinal, and his brother CARLO general of the papal troops; and the three sons of the latter exercised a vast influence, especially TADDEO, who succeeded his father as general of the papal troops, and married Anna Colonna. He acquired Palestrina and other fiefs, and became prefect of Rome in 1631 after the death of the duke of Urbino and the addition of the dukedom to the papal possessions. Other leading Italian houses, especially the Farnese, took umbrage at the increasing power of the Barberini, which led to the Castro war (1641-'4) for the possession of Castro and Ronciglione, Odoardo Farnese, duke of Parma, declaring that he was waging war against the Barberini, and not against the pope. Urban VIII. died in 1644, and though the election of his successor Innocent X. was due to the Barberini influence, one of the first measures of the new pope was to institute proceedings against them, and especially against Taddeo for financial mismanagement. Taddeo fled to Paris, where he died in 1647.—FRANCESCO, brother of the preceding, born in 1597, died in 1679. He became cardinal and vice chancellor, obtained great influence in the administration, and founded with the aid of Leo Allazzi, a Greek scholar, the Barberini library. He, too, had to leave Rome after the accession of Innocent X., but was permitted to return, and became dean of the sacred college.—ANTONIO, brother of the preceding, cardinal and high chamberlain under Urban VIII., born in 1608, died in 1671. He held high ecclesiastical offices in France through the favor of Mazarin, but returned to Italy after his reconciliation with the new pope.—Over 100,000,000 scudi passed into the hands of the Barberini family during their tenure of power. The Barberini palace, one of the largest in Rome, still attests their sumptuous and artistic tastes, and the library continues to be renowned for its valuable MSS.—The present head of the Barberini-Colonna family is ENRICO, prince of Palestrina, born March 26, 1823, who married in 1858 the princess Teresa Orsini.

BARBERRY (*berberis*), a genus of plants of the natural order *berberidaceae*, whose characteristics are: 6 roundish sepals, with bractlets outside; 6 obovate petals, with 2 glandular spots inside; 6 stamens; alternate, ovate, serrated, and pointed leaves; a shrubby habit, with yellow wood and inner bark; yellow flowers in drooping racemes; and sour berries and leaves. The stamens have a remarkable irritability, so that when the filament is touched on the inside with the point of a needle, they throw themselves quickly forward upon the stigma; the petals also follow them in this movement. This phenomenon is best observed in mild and dry weather, and can rarely be seen after the stamens have been dashed against each other by a violent wind or rain. The

genus comprises about 50 species, which are found in various regions from China to Mexico: several of them are evergreen, and most of them are ornamental as well as useful. *B. vulgaris*, or common barberry, has thorns upon the branches, obovate-oblong, bristly toothed leaves in rosettes or fascicles, drooping many-flowered racemes, and scarlet oblong berries. It is a native of the northern parts of Europe and Asia, but has become naturalized and thoroughly wild in the thickets and waste grounds of eastern New England. In the north of Europe it prefers the valleys, but in the south it grows on mountains, and is one of the most hardy of Alpine shrubs. In Italy it attains a height of from 4 to 6 ft., and lives for centuries. *B. Canadensis*, or American barberry, is a shrub from 1 to 3 ft. high, with leaves less sharply pointed and racemes with fewer flowers than the preceding, and is found on the Alleghenies of Virginia and southward. *B. aquifolium*, a native of western North America, has shining evergreen pinnated leaves,

Barberry (*Berberis vulgaris*).

and deep violet or red berries, and is often cultivated for its beauty. There are several other Asiatic and American species which are among the most hardy ornaments of gardens.—Nearly all the parts of this plant serve a useful purpose. The inner bark and the root, with the aid of alum, furnish an excellent yellow dye for coloring linen and leather. Its leaves are cropped by cows and sheep. It is probably by reason of its yellow color that it has been esteemed good for the jaundice, the same having been fancied also of the dock and carrot: but the bitterness and astringency of the bark have made it valued as a medicine. The berries are so acid that birds refuse to eat them; but when prepared with sugar, they make delicious and healthful preserves, sirups, and confits. It has been a very general opinion that barberry bushes cause blight to wheat sown in their vi-

city; but if this be true, it has not been accounted for.

BARBES, Armand, a French revolutionist, born at Pointe-à-Pitre, Guadeloupe, Sept. 18, 1809, died at the Hague, June 26, 1870. He went to southern France as an infant, and was educated for the bar. On the death of his father, who left him a large fortune, he went to Paris (1830), where he soon became conspicuous as a member of secret political societies. He was imprisoned for several months in 1834 on charges which were not substantiated. In 1835 he was arrested on suspicion of complicity in Fieschi's attempt at regicide, and soon afterward sentenced to a year's imprisonment for secretly making gunpowder. In 1839 he was sentenced to death as ringleader of an insurrection which resulted in the murder of Lieut. Drouineau; but his life was spared, and during his imprisonment he wrote *Deux jours de condamnation à mort* (Paris, 1848; 2d ed., with a letter of Louis Blanc). He recovered his liberty after the revolution of 1848, and was elected to the constituent assembly. For a new attempt at insurrection in May of that year, with Hubert, Raspail, and Blanqui, he was sentenced to perpetual imprisonment at Belle-Isle-en-Mer. He refused to accept a pardon from the emperor Napoleon in 1854, and being turned out of prison he went to Paris and asked permission to return to jail; but this being declined, he went to Spain, and afterward to Holland.

BARBEYRAC, Jean, a French jurist, born at Béziers, March 15, 1674, died March 3, 1744. He was the son of a Calvinist minister, and on the revocation of the edict of Nantes was taken to Switzerland and educated there. He taught at Berlin and Lausanne, and finally settled at Groningen as a professor of international law. He is best known for his translations from the Latin writings on public law of Grotius, Pufendorf, and others, with commentaries. He also published a supplement to the *Grand corps diplomatique*, with notes (5 vols. fol., Amsterdam, 1739), and a *Traité du jeu* (2d ed., 1737).

BARBIÉ DU BOCCAGE, Jean Denis, a French geographer, born in Paris, April 28, 1760, died Dec. 28, 1825. He was a pupil of D'Anville. He classified the documents brought by Choiseul-Gouffier from Greece, and attended from 1782 to 1824 to the publication of the *Voyage pittoresque de la Grèce*, which he illustrated with many valuable maps. Meanwhile he drew up the maps attached to Barthélemy's "Travels of Anacharsis," published in 1788. In 1807 he completed an excellent map of the Morea, and wrote a curious *Notice sur un manuscrit de la bibliothèque du prince de Talleyrand*, wherein he attempted to demonstrate that the eastern coast of Australia had been visited by the Portuguese as early as 1525.

BARBIER. I. Antoine Alexandre, a French bibliographer, born at Coulommiers, Jan. 11, 1765, died in Paris in December, 1825. He studied at the college of Meaux and took orders, but afterward renounced the priesthood and mar-

ried. He removed to Paris in 1794, and was commissioned to collect the books and works of art belonging to the abolished convents, in order to place them in the newly created public establishments. In 1798 he became librarian to the directory. Napoleon in 1807 made him his private librarian. In this capacity it was his duty to make reports on the most important works that were published. The libraries of the Louvre, Compiègne, and Fontainebleau were made up by him. After the return of the Bourbons he was superintendent of the private royal libraries till 1822, when he was suddenly discharged. His *Nouvelle bibliothèque d'un homme de goût* gives excellent directions for collecting a good library, and his *Dictionnaire des ouvrages anonymes et pseudonymes* is full of research, able criticism, and curious learning. He wrote many tracts and pamphlets on bibliographical subjects. **II. Edmond Jean François**, a French jurist, born in Paris, Jan. 16, 1689, died Jan. 29, 1771. His principal claim to attention is founded on his interesting *Journal historique et anecdotique du règne de Louis XV.* (Paris, 1856), embracing a period of 44 years, from 1718 to 1762. It narrates many facts not found in the newspapers of the time.

III. Henri Auguste, a French satirical poet, born in Paris, April 28, 1805. He was a lawyer, and his first poem, a satire called *La curée*, published just after the revolution of July, 1830, created a remarkable sensation by its boldness, originality, and roughness of language. Several other poems of the same kind appeared in quick succession, *La popularité* and *L'Idole* among the number. They were collected, under the title *Iambes*, in a volume which was eagerly sought for. His popularity afterward declined. *Il Pianto* and *Lazare* obtained but moderate praise. His later works have been neglected; and it has even been questioned whether he wrote the brilliant satires attributed to him in his youth. He translated Shakespeare's "Julius Cæsar" in 1848. His latest works are *Silves* (1864) and *Trois passions* (1867). He was chosen to the French academy in 1869. **IV. Paul Jules**, a French dramatist, born in Paris in 1822. His first drama was *Le Poète*, produced with success at the Théâtre Français in 1847. He afterward wrote *Amour et bergerie* (1848), *André Chénier* (1849), *Les derniers adieux* (1851), *La loterie du mariage* (1868), *Jeanne d'Arc* (1869), and many other dramas, comedies, vaudevilles, &c.; and in 1849 he became associated with M. Carré in furnishing Gounod with the texts for *Faust*, *Roméo et Juliette*, *Le Médecin malgré lui*, and *La reine de Saba*; Ambroise Thomas with *Hamlet*, *Mignon*, and *Peyché*; Victor Massé with *Galathée* and *Les noces de Jeannette*; and Meyerbeer with *Le pardon de Ploërmel*.

BARBIERI, Giovanni Francesco. See GUERCINO.

BARBOU, a family of French printers, distinguished for the perfection of their work. Beginning with JEAN BARBOU, who printed at Lyons in 1539, they succeeded each other as

prominent printers in the principal cities of Europe till 1808. HUGUES, the son of Jean, established himself at Limoges, where he printed in 1580 a beautiful edition of Cicero's epistles to Atticus. In 1699 the widow of CLAUDE, who carried on her husband's business at Paris, purchased of Fénelon's valet-de-chambre, who had stolen it from his master, the MS. of *Télémaque*, and printed it as far as the 208th page, when all the copies were seized by the government for political reasons and destroyed. JEAN JOSEPH lived in Paris in 1704, and was a printer and bookseller. He was succeeded in 1746 by JOSEPH GÉRAUD. In 1743 the abbé Lenglet-Dufresnoy commenced the publication of a new and elegant edition of the classics to fill the place of that of the Elzevirs, then becoming rare. This project was continued by JOSEPH GÉRAUD BARBOUR, who was succeeded by his nephew HUGUES; and 77 volumes of the classics were printed in this form, including the works of most of the prominent Latin authors. On the death of Hugues the business passed out of the hands of the family.

BARBOUR, the name of counties in three of the United States. I. A N. E. county of West Virginia; area, 380 sq. m.; pop. in 1870, 10,312, of whom 386 were colored. Its surface is hilly, and its soil very fertile, and well adapted for grazing. It is drained by the constituents of the east fork of the Monongahela river. Bituminous coal and iron ore are found, and salt mines have been opened. In 1870 the chief productions were 42,805 bushels of wheat, 173,195 of Indian corn, 43,367 of oats, 10,803 tons of hay, and 81,973 lbs. of wool. Capital, Phillips. II. A S. E. county of Alabama, bounded E. by the Chattahoochee river, which separates it from Georgia; area, about 900 sq. m.; pop. in 1870, 29,809, of whom 17,165 were colored. It has an undulating surface, partly covered with forests of pine. The soil in the valleys of the streams is fertile, and suitable for Indian corn and cotton. The chief productions in 1870 were 364,304 bushels of Indian corn, 42,734 of sweet potatoes, 17,011 bales of cotton, and 25,788 gallons of molasses. Capital, Clayton. III. A S. county of Kansas, not yet settled, bordering on Indian territory; area, 780 sq. m. The Nescatunga river, a tributary of the Arkansas, intersects the S. W. corner, and a branch of the former also drains the N. and E. portions of the county.

BARBOUR, James, an American statesman, born in Orange county, Va., June 10, 1775, died June 8, 1842. While very young he served as a deputy sheriff, and at the age of 19 was admitted to the bar. He was a member of the legislature of Virginia from 1796 to 1812, when he became governor of the state. After serving two terms in this office he was elected to the United States senate (1815), where for several sessions he was chairman of the committee on foreign relations. He remained in the senate till 1825, when President John Quincy Adams appointed him secretary of war. In

1828 he became minister to England, but was recalled the next year by President Jackson, of whose administration and that of Mr. Van Buren he was a vigorous opponent. In 1839 he presided at the Harrisburg convention, which nominated Gen. Harrison for president.

BARBOUR, John, a Scottish poet and historian, born in Aberdeen about 1320, died about 1396. Little is known of his early life. He was appointed archdeacon of Aberdeen by David II. in 1356. He made two visits to Oxford by royal permission for the purpose of studying, and in 1368 obtained a passport to France for a similar object. At one time he was one of the auditors of the exchequer for King Robert II. The work which has made his name famous is his poem of "The Bruce," a history of the life and deeds of Robert Bruce. He is known to have also written a metrical romance, now lost, called "The Brute," on the mythical Brutus the Trojan. Barbour received two pensions, one charged on the customs of Aberdeen for life, and another in perpetuity from the borough rents, recorded as a reward for the production of "The Brute." At his death he assigned the latter to the chapter of the cathedral church of Aberdeen, to pay for an annual mass for his soul. The first known printed edition of "The Bruce" is that of 1616 (Edinburgh), but there is believed to have been an earlier one. The best of the later editions is that of Dr. Jamieson (4to, Edinburgh, 1820).

BARBY, a town of Germany, in the Prussian province of Saxony, on the left bank of the Elbe, 15 m. S. E. of Magdeburg; pop. in 1871, 5,212. The inhabitants are chiefly engaged in the manufacture of woollens and linens. The Moravians in 1749 established at Barby a *Pädagogium* (educational institution), which in 1809 was transferred to Niecky in Lusatia. The town has a normal school and a hospital for the blind. It was formerly the seat of the counts of Barby, who became extinct in 1659.

BARCA, a country of Africa, bounded N. by the Mediterranean, E. by Egypt, W. by the gulf of Sidra or Great Syrtis, S. by the Libyan desert. It lies between lat. 29° and 33° N., lon. 20° and 25° E., and corresponds nearly to the ancient Cyrenaica, although the boundaries are not clearly defined. The population is estimated at about 400,000, mostly nomadic Arabs and Berbers. The northwestern portion is elevated, has a healthy climate, and many fertile tracts producing rice, grain, dates, olives, sugar, tobacco, saffron, and senna; it is well adapted to the culture of grapes. The eastern and southern portions are sandy, gradually merging in the desert. The horses of the country are of a famous breed; there are sheep of the fat-tailed species, camels, and buffaloes. Barca is governed by its beys, who are tributary to the bey of Tripoli. It was an early colony of the Greeks; it afterward became subject to Egypt, and still later a province of the Byzantine empire. It was conquered by the Arabs in 641. The most important towns

are Benghazi (anc. *Berenice*), and Derne (anc. *Darnis*). (See CYRENAICA.)

BARCA, or *Barce*, an ancient inland city of Cyrenaica, founded by revolted Cyrenæans and Libyans about 554 B. C. Arcesilaus II., king of Cyrene, was signally defeated in an attempt to punish this secession, and the power of Barca was soon extended to the seacoast and W. toward Carthage. About 514 B. C. Arcesilaus III. of Cyrene, having taken refuge with his father-in-law Alazir, king of Barca, was slain by the citizens. His mother Phertima induced the Persian satrap of Egypt to besiege Barca, and after it was captured caused numbers of the citizens to be crucified around the walls, on which she fixed as bones the breasts of their wives. Many others were made slaves and removed to Bactria. Under the Ptolemies most of the remaining inhabitants were removed to the new city of Ptole-

mais (now Tolmeta) on the coast. The old town was still in existence in the 2d century of our era, and its ruins are now traced near the village of Merjeh.

BARCA, or *Barca*, an epithet applied to Hamilcar and other Carthaginian generals, and supposed to signify "lightning," like the Hebrew Barak.

BARCELONA. I. A province of Spain, in Catalonia, bordering on the Mediterranean; area, 2,988 sq. m.; pop. in 1867, 749,143. It is less mountainous and better cultivated, more densely peopled, and in general more flourishing than any other Catalonian province. The Llobregat, its principal river, intersects it N. and S. It is traversed by several railways, and has good roads. Its chief products are grain, oil, wine, fruit, hemp, silk, iron, copper, and coal; there are several salt mines and numerous mineral springs. II. A city and seaport, cap-

Barcelona.

ital of the above described province, situated in lat. 41° 21' N., lon. 2° 10' E., on the Mediterranean, 815 m. E. N. E. of Madrid, in a beautiful plain between the rivers Besos and Llobregat, at the foot of Mount Monjuich (the Mons Jovis of the Romans, the Mons Judaicus of the middle ages, so named because it was then inhabited by the Jews); pop. in 1864, 190,000; in 1868, including the large suburb of Barceloneta, 187,095. The diminution is ascribed to the mortality caused by the cholera of 1865, and the removal of much of the manufacturing industry beyond the municipal boundary. It is the most flourishing, and after Madrid the most populous city in Spain, the great manufacturing and commercial emporium, and one of the finest cities of the peninsula. The harbor is formed by a huge mole, running

southward for a considerable distance from the shore; the depth of water within the mole is 20 ft. The fort of Monjuich, south of the town, stands upon the isolated hill of that name, 752 ft. above the level of the sea. It commands the city, the citadel, and the port, and is considered by the Spaniards to be impregnable. The citadel, N. E. of the town, is a regular fortress built on the system of Vauban. There are also walls, ditches, and batteries. Barcelona is the see of a bishop and the seat of an audiencia. It has a university opened in 1868, several commercial academies, and many civil, military, art, and benevolent institutions, prominent among which is the *junta de comercio*, or board of trade, which supports professorships of navigation, architecture, chemistry, experimental philosophy, agri-

culture, commerce, mechanics, and foreign languages. The city is generally well built; the houses in the newer part are mostly of brick four or five stories high, with ornamented balconies. The principal streets are long, wide, well paved, and lighted. In the older portion the streets are narrower, and crooked, but picturesque. Foremost among its numerous promenades is the Rambla (so called from the Arabic *raml*, sand, applied to a dry river bed, used as a road). There is also a fine promenade around the ramparts, with pleasant views toward the sea. Among the churches are the cathedral, a fine structure, which the Moors converted into a mosque; the church of Santa Maria del Mar, erected on the site of a chapel of the Goths, the rebuilding of which was begun in 1328, and completed in 1483; and the church of San Cucufat, erected on the spot where its patron saint was martyred. Other public buildings are the *casa consistorial* and *casa de la diputacion*, the *casa lonja* or exchange, and the palace of the captain general. There are many Roman antiquities, but mostly in fragments.—The commerce and manufactures of Barcelona have received a great impulse since 1860. Many large manufacturing establishments, especially of silk and cotton, have sprung up. In 1865 there were 7 banking companies, 10 marine insurance companies, 5 railway companies, 4 steam navigation companies, 3 canal companies, and 3 gas companies. The bank of Barcelona, founded in 1844, has a capital of 80,000,000 reals (\$10,000,000), of which 20,000,000 has been paid up. Railways are being gradually extended from Barcelona into the interior. The principal exports are silks and cotton goods, paper, hats, laces, ribbons, soap, steel, and firearms. The principal imports are raw cotton, sugar, coffee, cocoa, and other colonial products, mainly from Cuba and Porto Rico; salted fish, hides, and horns. Iron and coal, machinery and hardware, have lately been largely imported from England. Most kinds of manufactured goods are prohibited, but they are smuggled in considerable quantities. The coastwise trade is also very considerable. In 1863 the imports at Barcelona were \$50,784,079; the exports, \$16,864,490; value of imports, \$41,849,940; of exports, \$72,420,770.—Barcelona, according to tradition, was founded by Hercules 400 years before the building of Rome. It was reestablished or, according to more trustworthy accounts, founded by Hamilcar Barca, the father of Hannibal, who called it Barcino, whence comes its present name. After the expulsion of the Carthaginians, it fell into the hands of the Romans, who made it a colony, known also under the name of Faventia. In the 5th century it was taken by the Goths; in the 7th century by the Arabs, from whom it was reconquered about 800 by the Christians, aided by Charlemagne. It was then governed until the 12th century by counts, who were really independent, though

nominally subject to the Carlovingian kings. It subsequently became attached to the kingdom of Aragon, preserving however its most important municipal privileges. During this period the Barcelonians competed with the Italians for the commerce of the Levant, and were among the first to establish consuls and factories in distant parts for the protection of their trade. The famous code of maritime law known as the *Consolato del Mar* is said to have been compiled and promulgated at Barcelona. Marine insurance and the negotiation of bills of exchange were practised here at an early date. In 1640 Barcelona rose against the tyranny of Philip IV., and threw herself into the arms of France. It was retaken in 1652. In 1697 it was captured by the French, but restored to Spain in the same year. During the war of the succession, it espoused the cause of Austria. In 1706 it was captured by the Spaniards and English under the earl of Peterborough. In 1714 it was bombarded and taken by the French, under the command of the duke of Berwick. In 1808 it was taken by Napoleon, who held it till 1814. In 1842 it revolted against the queen of Spain, and was bombarded and taken by Espartero in December. Another insurrection, which broke out in June, 1843, was suppressed, after a bombardment, in November, and another, in July, 1856, after a few days, but with considerable bloodshed. Several minor popular movements took place both before and after the fall of Queen Isabella.

BARCELONA. I. A N. state of Venezuela, bounded N. by the Caribbean sea and S. by the river Orinoco; area, 13,800 sq. m.; pop. about 78,600. Except a belt of hills that border the coast, where there are excellent arable lands, and the best plantations in the state, the face of the country is composed of low plains and extensive plateaus, offering fine pasturage for cattle, horses, and mules. The chief rivers are the Neveri, Pao, and Unare. Cacao, coffee, sugar cane, cotton, maize, coconuts, and tropical fruits are largely produced. The state is divided into 6 cantons. II. A city, formerly called New Barcelona, capital of the state, situated near the mouth of the Neveri, which is here crossed by a wooden bridge, about 8 m. from the sea, and 160 m. E. of Caracas; pop. about 6,000 (in 1800, 16,000) half colored. It was founded in 1637 by Juan Urcin at the foot of the Cerro Santo, whence it was transferred to its present site in 1671 by Sancho Fernando de Agula. The city has been nearly ruined by war and revolution. There is a church and several schools. The houses are mostly of mud, ill constructed and poorly furnished; and the streets are unpaved and in rainy weather extremely filthy, while in dry weather the dust is intolerable. The harbor and shipping are protected by a fortress, on a hill 400 feet above the level of the sea. The climate, owing to the excessive heat and moisture of the air, is exceedingly insalubrious, and

the city is said by Humboldt to be one of the most unhealthy places on the globe. The surrounding country is very fertile. Barcelona exports horned cattle, jerked beef, hides, indigo, annatto, cotton, and cacao.

BARCKHAUSEN, or *Barchusen*, **Johann Konrad**, a German physician and chemist, born at Horn, in Westphalia, March 16, 1666, died Oct. 1, 1723. He studied medicine and pharmacy at Berlin, Mentz, and Vienna, and afterward accompanied the Venetian troops into the Morea. In 1703 he was made professor of chemistry at Utrecht. He wrote several treatises on chemistry, embodying the result of important researches, a history of medical sects, *Collecta Medicinæ Practicæ generalis* (Amsterdam, 1715), &c.

BARCLAY, **Alexander**, an English poet, born in the latter part of the 15th century, whether in England or Scotland is uncertain, died at Croydon in June, 1552. He was educated at Oxford, travelled through Europe, acquiring a knowledge of several languages, became a Benedictine and afterward a Franciscan, and was a monk at Ely when that monastery was suppressed in 1539. He became vicar of Great Badow in Essex and of Wokey in Somersetshire, and finally rector of All Saints in Lombard street, London, complying probably with the new ecclesiastical order. His most noted work is "The Ship of Fools," based on Brant's *Narrenschiff*. It was printed by Pynson in 1509. His "Egloges" are noted as the earliest specimens of English pastoral poetry. He also wrote "The Castle of Labour," printed by Wynkyn de Worde in 1506, and "The Myrroure of Good Manners," besides some lives of saints, a work on French pronunciation, and a translation of Sallust's "Jugurthine War." He possessed a culture and refinement unusual in his day, and did much to revive a taste for literature, which was then at a low ebb.

BARCLAY, **John**, a Scottish anatomist, born in Perthshire in 1760, died in Edinburgh in 1826. He studied divinity at the united college of St. Andrews, was licensed as a preacher, visited Edinburgh as tutor in the family of Sir James Campbell, where he commenced the study of anatomy, acted as assistant to Mr. John Bell, and graduated in 1796, when he went to London and studied under Dr. Marshall. On his return to Edinburgh in 1797, he gave lectures on anatomy. He published several works on anatomy, and made some efforts toward reforming the system of anatomical nomenclature. He bequeathed his valuable anatomical collection to the royal college of surgeons of Edinburgh, where it is known as the Barclayan museum.

BARCLAY, **John**, an English Latin author, son of William Barclay, born at Pont-à-Mousson, France, Jan. 28, 1582, died in Rome, Aug. 12, 1621. He was educated at the Jesuits' college of Pont-à-Mousson, and the Jesuits endeavored to induce him to join their order; but his father refused to give his consent and took

him to England in 1608. At the beginning of the following year he presented James I. with a Latin poem entitled *Kalendæ Januaria*, and afterward dedicated to him the first part of *Euphormionis Lusinii Satyricon*. He was not successful in obtaining preferment in England on account of being a Catholic, and returned more than once to France, and married there. He resided in England from 1606 to 1615. In 1609 he published his father's work *De Potestate Papæ*. This was attacked by Cardinal Bellarmine, and John Barclay published a large volume in Latin in answer to the cardinal, to which a reply was made by the Jesuit Eudæmon. The fourth part of the *Satyricon* was published in 1614. It is a satirical romance directed against the Jesuits. His resources in England being scanty, he went to Paris in 1615 and remained there until the following year, when he removed to Rome on the invitation of Pope Paul V. He published at Rome an *Apologia pro se* (often printed with the *Satyricon*), in which he defended himself against the charges of heresy brought against him by the Jesuits, and his *Parænesis ad Sectarios*. He was treated with great kindness at Rome, but not obtaining any appointment devoted himself to literary pursuits and to the cultivation of flowers. He shared in the passion for the tulip which then began to spread throughout Europe. Here he composed the *Argenis* (London, 1621), his most celebrated work, a prose romance in Latin, in which political questions are discussed with great spirit and originality in feigned dialogue. This book was a favorite with Cardinal Richelieu and Leibnitz, was more read than any other work of its day, and has been translated into almost every language of Europe. Its Latin style is highly praised by Grotius.

BARCLAY, or *Barclay-Allardice*, **Robert**, commonly known as Captain Barclay, a British pedestrian and a captain in the British army, born Aug. 25, 1779, died May 8, 1854. His father, a skilful farmer, descended from the famous Quaker, Barclay of Ury, was himself a noted pedestrian, having walked 510 miles in 10 days. His son at the age of 15 won his first match, walking 6 miles within an hour. In December, 1799, he walked 150 miles in two days; in June, 1800, 300 miles in five days; in 1801, 110 miles in 19 hours 27 minutes; and in 1806, 100 miles in 19 hours, on a hilly public road. One of his most surprising performances was walking 1,000 miles in 1,000 successive hours; £100,000 were staked on the result. After the feat was accomplished, Barclay slept 17 hours, and awoke in his usual health and vigor. He afterward trained Tom Cribb, champion of England, for his fight with Molyneux, which took place Sept. 29, 1811. In the latter part of his life Captain Barclay devoted himself to the cultivation of his paternal estate, and to breeding sheep and cattle. In right of his mother, Sarah Ann Allardice, he received a charter of the barony of Allardice

in 1800; and in 1839 he laid claim to the barony of Airth, as heir through her of William Graham, last earl of Airth and Monteith (died 1684).

BARCLAY, Robert (called Barclay of Ury), a distinguished member of the society of Friends, born at Gordonstown, Scotland, Dec. 23, 1648, died at Ury, Oct. 18, 1690. He was sent for his education to the Scotch college at Paris, of which one of his uncles was rector; but efforts having been made to convert him to Catholicism, he returned home about 1664. In 1667 he embraced the principles of the society of Friends, and in 1670 vindicated them from charges which had been brought against them in a publication entitled "Truth cleared of Calumnies." He published in 1676 in Latin, and in 1678 in English, "An Apology for the True Christian Divinity, as the same is held forth and preached by the People called in scorn Quakers." Its dedication to King Charles II. is a model of frankness and independence. It was the ablest defence that had been made at that time of the doctrines of the Friends, and is perhaps the ablest that has ever been made. It materially affected public sentiment in regard to the Friends. His "Treatise on Universal Love" (1677) was the first of the remonstrances which have been made by the Friends against the criminality of war. He made various journeys in England, Holland, and Germany, generally in company with William Penn, for the propagation of his doctrines, and was several times imprisoned on account of them; but the English government upon the whole was indulgent toward him. Charles II. was his friend, and in 1679 made his estate of Ury a free barony with the privilege of criminal jurisdiction. He was appointed in 1682 by the proprietors of East Jersey in America governor of that province, but he only exercised the office by deputy.

BARCLAY, William, a Scottish jurist, born in Aberdeenshire in 1541 or 1546, died at Angers, France, in 1605. He studied law at Bourges, under Cujas, and received the degree of doctor of laws. He was soon after appointed professor of the civil law in the university of Pont-à-Mousson, then recently founded by the duke of Lorraine. He was also made counsellor of state and master of requests. Having quarrelled with the Jesuits on account of his refusal to let his son enter the society, he lost favor, went to England, and was offered a professorship of law upon condition that he would renounce the Roman Catholic faith. This he refused, and returned to France, where he was made professor of law at Angers. During the troubles of the league he supported the royal cause and was uniformly an opponent of the ultramontane doctrines. His principal works are: *De Regno et Regali Potestate* (Paris, 1600); a commentary on the title of the Pandects *De Rebus Creditis et de Jure Jurando*; and a treatise *De Potestate Papæ* (London, 1609), in which the independent rights of sovereign princes against the pope are vindicated.

BARCLAY DE TOLLY, Michael, prince, a Russian general, born in Livonia in 1759, died at Insterburg in East Prussia, May 25, 1818. He was a descendant of the Scottish Barclays. Being adopted by Gen. Van Vermoulen, he entered a Russian regiment of cuirassiers as a sergeant, and served with credit in the Turkish war of 1788-'9, in the Swedish campaign of 1790, and in the campaigns against Poland in 1792 and 1794. In the Polish campaign of 1806 he was a major general, and distinguished himself at Pultusk as the commander of Benning's advance guard. He defended Eylau with great bravery in 1807, and there lost an arm and won the title of lieutenant general. In 1809 he marched with 12,000 men for two days on the ice across the gulf of Bothnia, and compelled the Swedes to surrender at Umea. He was soon after made governor of Finland, and in 1810 became minister of war, in which office he remained three years. In 1812 he took command of the first army of the west, the second being under Prince Bagration, and conducted the retreat to Smolensk for the purpose of drawing the enemy into the interior of the country. This retreat and the loss of the battle at Smolensk gave the Russian national party, who hated him as a foreigner, an opportunity against him, and he was superseded in the command by Gen. Kutuzoff. He led the right wing on the Moskva, did brilliant service in 1812 at Bautzen, and was again placed in chief command of the army. He took part in the battles of Dresden, Culm, and Leipzig, and in 1814 was made a prince and field marshal. After visiting London with the emperor Alexander, he returned to the army at Warsaw, and remained in command until the war was over.

BAR-COKHEBA, or Bar-Cokhebas, the leader of a Jewish insurrection during the reign of Hadrian, killed A. D. 135 or 136. His real name is believed by some critics to have been Simeon, but his followers called him Bar-Cokheba (son of a star), and applied to his appearance the prophecy of Balaam, "There shall come a star out of Jacob," &c. The harshness of the Roman rule in Judea made the people eager for an insurrection, and Bar-Cokheba was readily supported by the great rabbi Akiba and his numerous disciples. In 131 he gathered a large army, took Jerusalem and other important places, proclaimed himself the Messiah and ruler of the Jews, and had coins struck in his own name. Hadrian ordered Julius Severus from Britain to the scene of the insurrection. Jerusalem was retaken and the whole province desolated, but Bar-Cokheba long maintained himself at Bethar, fighting obstinately, and falling when that fortress was finally stormed. All his prominent followers were executed. The insurrection cost hundreds of thousands of lives, and was followed by greater oppression than ever.

BARD (Cymric, *bardh*; Gaelic, *bard*), a professional poet, who made his livelihood by

singing the amours and battles of gods, the deeds of heroes, the glory and genealogy of chiefs, and the victories of tribes over their enemies. Bards were called *arddi* or rhapsodists by the Greeks, *vates* by the Latins, *scalds* by the Scandinavians, *scopes* by the Anglo-Saxons, *ollamhs* by the Irish, and *baydars* and *spiewaks* by the Slavs. In ancient Gaul they were a subdivision of the druids, or the priestly and learned order. Cæsar says that they spent 20 years in their education, acquiring the knowledge by rote of an immense number of verses, which they did not record in writing, but handed down by word of mouth from generation to generation. After the subjugation of Gaul this profession was put under restrictions, and eventually annihilated by the Roman civil power both in Gaul and in that part of Britain which fell within the pale of Roman civilization. Wales, Cornwall, Cumberland, and Strathclyd, only remotely affected by the Roman conquest, kept alive the flame of minstrelsy. In the parish of Llanidan, in the isle of Anglesey, are the remains of an arch-druid's palace, surrounded by the several colleges into which druidism was divided. One of these colleges, or independent buildings, is called by the peasantry at this day *trer beirh*, or hamlet of the bards. Each chief of a clan in Britain had a bard, whose office was hereditary in the family. At the feasts of Christmas, Easter, and Whitsuntide the *bardd teulu*, or court bard, sat next to the master of the ceremonies, and received the steward's robe as his fee. The bard who had won in the musical contest of the day was to sing, first to the glory of God, secondly to the glory of the prince; and then the *teuluier*, or regular court bard, was to sing on the topics of the day. On investment, the court singer received a harp from the prince and a ring of gold from the queen. The pagan tendencies of these singers finally led to their discouragement, and in 1078 Gryffyth Conan, prince of Wales, issued edicts placing them under rigid restrictions. Many of the Welsh bards abandoned their profession at this change, and their places were supplied by ollamhs from Erin, who introduced into Wales all the instrumental music for many centuries in use there. In the edicts of Conan the bards were classified in several ways: 1, the bards of the princes and nobles, or *pruddud*; 2, bards of the middle ranks, or *selmar*; 3, bards for the lower classes, or *clewr*. There were three special sub-classes, viz., composers, instructors of the rising generation, and heralds. Some professed the faculty of second sight, as diviners, sorcerers, interpreters of dreams, &c. For mutual encouragement and instruction, public sessions of the Welsh bards (*eisteddfoda*) were held for many centuries at the town of Caerwys, the residence of the prince of Wales; at Aberffraw, in Anglesey, for the bards of that island and the adjoining county; and at Mathraval, for those of the land of Powis. Only minstrels of skill performed,

and degrees were conferred according to the branch in which the victors had perfected themselves. After the conquest of Wales by Edward I. of England (1282), royal commissioners were appointed who presided over the *eisteddfoda*, and acted the part of censors and inquisitors. No bardic poem was allowed to be circulated which appealed to the patriotic sentiments of the conquered race. The story of the massacre of the Welsh bards and the destruction of their records is a fiction, originating in Edward's stringent measures against the right of free song. The last *eisteddfod* held under royal commission was in the reign of Elizabeth, at Caerwys, in 1569. On this occasion, the victor of the silver harp was Simon ap Williams ap Sion. Various persons received degrees, some as chief bards of vocal song, others as primary, secondary, or probationary students; and many more as bards, students, and teachers of instrumental song upon the harp. The degrees were four in the poetical and five in the musical faculty. Toward the end of the last century some patriotic Welsh gentlemen determined to revive the *eisteddfod*. In 1770 the Gwyneddigion society was formed, in 1818 the Cambrian society, and some years later the Cymmoridian, or metropolitan Cambrian institution, of which George IV. of England declared himself the patron. Annual meetings have since been held for the recitation and reward of prize poems, and performances upon the harp. The above-named societies have been instrumental in preserving relics of the poems of Myrddyn ap Morfryn, Myrddyn Emrys, Talliesin, and other less celebrated composers of triads. The bards of Ireland formed a hereditary guild, and were divided into three classes, the *filedha*, who sang in the service of religion and in war, and were counsellors and heralds to the princes; the *breitheamhaim*, who chanted the laws; and the *seanachaidhe*, who were chroniclers for princes and nobles. They were anciently held in high esteem, but their tendency to foster a rebellious spirit led to their suppression. Turloch O'Carolan, who died in 1737, is generally regarded as the last Irish bard. The bards of Scotland are believed to have been on a similar footing with those of Ireland, but nothing is known of their actual history, and no remains of their songs have been preserved.

BARD. I. John, an American physician, born near Philadelphia, Feb. 1, 1716, died March 30, 1799. He removed to New York in 1746, where he rose to the first rank among physicians. In 1759, on the arrival of a ship on board of which a malignant fever was raging, Dr. Bard was appointed to take measures to prevent the disease from spreading. He succeeded in keeping the pestilence within the limits of a temporary hospital, but to guard against similar dangers in future, at his suggestion Bedloe's island was purchased, and hospital buildings were erected thereon, which were placed under his charge. Upon the estab-

lishment of the New York medical society in 1788, he was elected its first president. He left an essay on malignant pleurisy, and several papers on the yellow fever. **II. Samuel**, an American physician, son of the preceding, born in Philadelphia, April 1, 1742, died May 24, 1821. He studied at King's (now Columbia) college, New York, and at the medical school of Edinburgh. On his way to Edinburgh he was captured by a French vessel, and was released by the influence of Dr. Franklin, who was then residing in London. After taking his degree he travelled through Scotland and parts of England, studying minerals, plants, animals, arts, and manufactures. Returning to America in 1767, he entered at once upon the practice of his profession in New York, in partnership with his father. He effected the organization of a medical school, which was united to King's college, and in which he was appointed professor of the practice of physic, and subsequently became dean of the faculty. After the revolutionary war he was for a time Washington's family physician, the general government being then in New York. Through his influence a public hospital was opened in New York in 1791, and he was appointed its visiting physician. He retired in 1798 to his country seat in New Jersey, and devoted himself to agricultural pursuits. In 1813 he was appointed president of the college of physicians and surgeons in New York. He left several tracts on medical subjects.

BARDAS, a patrician of Constantinople, brother of Theodora, the wife of the emperor Theophilus, and uncle to the emperor Michael III., killed April 21, 866. On the death of Theophilus (842) he was appointed tutor to the young prince Michael, in conjunction with Theoctistus and Manuel. He did much to revive science, but caused Theoctistus to be slain and Manuel to be banished, threw his sister the empress into prison, exiled the patriarch Ignatius, and assumed the title of Cæsar (856). His cruelty and arrogance raised a bitter opposition, and Michael at last consented to his assassination by Basil the Macedonian, afterward emperor.

BARDESANES, or **Bar-Delsan**, a Gnostic, who flourished at Edessa, Syria, in the latter half of the 2d century, and founded a sect designated as Bardesanists. The common opinion is that Bardesanes was a disciple of Valentine, but Neander thinks that both Marcion and Bardesanes drew from the same fountain as Valentine, the Syrian Gnosticism. From the fact that Bardesanes wrote afterward against the Gnostics, and then, still later, showed himself a Gnostic again, he has been accused of being fickle; and Eusebius says of him that, although he refuted at one time most of the opinions of Valentine, "he did not entirely wipe away the filth of his old heresy." Neander thinks there is no evidence that Bardesanes was other than a Gnostic in the whole of his career as a theologian. He believed the devil to be self-existent and independent; that

Christ was born of a woman, but brought his body from heaven; and he denied the resurrection of the human body.

BARDILL, **Christoph Gottfried**, a German metaphysical writer, born at Blaubeuren, in Württemberg, May 28, 1761, died in Stuttgart in 1808. He is principally known by his work on the elements of logic, published in 1800, and directed against the philosophy of Kant. He was a very abstruse and obscure writer, but his system contains the germ of the later philosophy of absolute identity.

BARDIN, **Jean**, a French historical painter, born at Montbard, Oct. 31, 1732, died at Orleans, Oct. 6, 1809. He studied painting in Rome, and under Lagrenée and Pierre in Paris. In 1764 he gained the prize for his picture of "Tullia driving over the Body of her Father." He afterward became a member of the institute and director of the school of fine arts at Orleans. His *chef-d'œuvre*, "Christ disputing with the Doctors," procured him admission to the academy in 1795. Among his pupils were David and Regnault.

BARDINGS, horse armor of the middle ages. See **ARMOR**, vol. i., p. 784.

BARDSTOWN, or **Baldstowa**, a post town and the capital of Nelson county, Ky., situated on an elevated plain near the Beech fork of Salt river, 40 m. by rail S. E. of Louisville, on a branch of the Louisville and Nashville railroad; pop. in 1870, 1,835. It is the seat of a Roman Catholic theological seminary, and preparatory seminary. It contains several churches, and has factories of cotton, woolen, and other fabrics.

BAREBONE, **Praise God**, an English fanatic in the time of Cromwell. He was a leather dealer in London, and a conspicuous member of the short parliament called together by Cromwell in 1653, which was on that account nicknamed Barebone's parliament. When Gen. Monk came to London, Barebone marched at the head of a large procession of the people and presented to parliament a remonstrance against the restoration of the king. In 1661 he was arrested and thrown into the Tower on a charge of being concerned in a plot against the government. He was afterward released, but his further history is unknown. It is said that two of his brothers assumed the names respectively of "Christ came into the World to save Barebone," and "If Christ had not Died Thou hadst been Damned Barebone."

BAREFOOTED FRIARS AND NUNS, religious orders in the Roman Catholic church, which discard the use of coverings for the feet, either at all times or at special seasons. Thus the nuns of our Dear Lady of Calvary go unshod from May 1 to Sept. 14. Some wear sandals of wood, leather, or platted rope, fastened to the feet by thongs. About 25 different orders of barefooted friars and nuns are enumerated, the most prominent of which are: The barefooted monks of St. Augustine, who spread over France and the Indies; the barefooted

nuns of St. Augustine; the barefooted Carmelites of Avila, male and female, in Spain, Portugal, France, Italy, Germany, and India; the barefooted Trinitarians, in Spain, Italy, France, Germany, Poland, Hungary, and Bohemia; nuns of St. Francis of the stricter observance, established in France in 1593, and afterward endowed with the convent of Picpus in Paris, whence they are often called *les Picpus*, and the Passionists.

BARÈGES, a French watering place in the department of Hautes-Pyrénées, 25 m. S. of Tarbes, situate in the Bastan valley, 4,000 feet above the sea, between two chains of mountains. The village consists of one long street on the Gave de Bastan, and forms part of a commune with only about 600 permanent inhabitants, who escape from the snow and avalanches during the winter to the town of Luz. The fine silk crêpe tissue first took its name from Barèges, though chiefly manufactured at Bagnères de Bigorre. During summer and autumn Barèges can accommodate about 800 invalids and visitors. The springs rise near the junction of the slate rock with the granite, and are celebrated for curing ulcers, rheumatism, scrofula, tumors, and gunshot and other wounds. Their principal ingredients are sulphuret of sodium, carbonate, muriate, and sulphate of soda, azotic and sulphuretted hydrogen gases, and animal matter. Their temperature varies from 73° to 120° F. They have been known since the 16th century, but became fashionable only at the end of the 17th, after they had been successfully employed by Madame de Maintenon for the cure of the crippled duke de Maine, Louis XIV.'s natural son. A new bath house was erected by the French government in 1864, and the springs are described in Dr. Macpherson's "Baths and Wells of Europe" (1869). Barèges is the seat of a famous military hospital.

BARÉILLE, Jean François, abbé, a French theologian, born at Valentine, Haute-Garonne, in 1813. He received a superior education and became honorary canon of the dioceses of Toulouse and Lyons, and afterward director of a school at Sorèze. He has published *Histoire de Saint Thomas d'Aquin* (1846; 4th ed., 1862), and *La vie du cœur* (1856; 3d ed., 1863); and he has translated several works of Balme, the *Œuvres complètes de Louis de Grenade* (21 vols., 1861-'6), and the *Œuvres complètes de Saint Jean Chrysostome* (10 vols., 1864-'7, and 4 vols., without the original text, 1866-'7). The French academy in 1868 conferred one of the Monthyon prizes upon his translation of the *Homélies* in the 3d volume of the last-mentioned edition.

BARÉILY, a city of the Northwest Provinces of Hindostan, capital of a district of the same name, in the region of Rohileund, on a branch of the Ganges, in lat. 28° 23' N. and lon. 79° 26' E., 122 m. E. by S. of Delhi; pop. 92,000, two thirds of whom are Hindoos. It was ceded to the British in 1801. The officials live

in a citadel outside the town. The inhabitants are engaged in the manufacture of swords, daggers, carpets, saddles, housings, embroidery, jewelry, brass wares, and cabinet work. In the last two of these branches of manufacture they particularly excel. The sepoy garrison mutinied May 31, 1857, and killed every European that fell in their way. The place was recovered by Sir Colin Campbell in the following year.

BARENTZ, Willem, a Dutch navigator, died June 20, 1597. He was appointed chief pilot of the vessel fitted out by the city of Amsterdam in the expedition which sailed from Holland June 5, 1594, in search of a passage to China and India northward of Asia. The ship in which Barentz sailed explored Nova Zembla, sailed to the N. E. extremity of the island, reaching lat. 77°, and then turned back (Aug. 1). The next year the government of Holland equipped a second expedition of seven vessels, spending half the summer in loading them with rich merchandise for the East. Barentz was appointed head pilot of the whole expedition, but it started so late in the season that nothing of importance was accomplished. The city of Amsterdam despatched a third expedition, consisting of two ships, under Jacobus van Heemskerck and Jan Cornelisz Ryp, May 18, 1596. Barentz was the pilot on one of them. The two vessels visited Spitzbergen together, and afterward parted company. Barentz's vessel sailed in the direction of Nova Zembla, and succeeded in doubling its N. E. extremity, but then encountered ice, and being unable to continue its voyage eastward, turned southward Aug. 25. On Sept. 1 it was frozen up in Ice Haven, and the crew were forced to spend the winter there "in great cold, poverty, misery, and grief" and with no sun from Nov. 4 to Jan. 24. The crew, with the exception of two who had died, quitted Ice Haven June 14, 1597, in two open boats, and Barentz died a few days afterward. The survivors after two and a half months reached the N. E. shore of Lapland, and were there rescued by Cornelisz.

BARÈRE DE VIEUZAC, Bertrand, a French revolutionist, born at Tarbes, Sept. 10, 1755, died in January, 1841. He was educated for the law. In 1789 he was elected a deputy to the states general, and published a journal, *Le point du jour*, in which he gave an account of the proceedings of that body. He took part in nearly every debate, always being foremost in the popular movements of the time. On the death of Mirabeau he was chosen to deliver the panegyric. On the adjournment of the assembly he was appointed one of the judges of the *tribunal de cassation*. In 1792 he was elected a member of the convention, where he voted for the immediate death of the king. He was elected a member of the committee of public safety in 1793, and at first avoided committing himself to either party; but when the ascendancy of the Jacobins was

secured, he proposed the prosecution of the Girondists and the death of Marie Antoinette, the confiscation of all property belonging to outlawed citizens, the formation of a revolutionary army, the declaration that "terror was the order of the day," and the transportation of all who had not given evidence of their patriotism (*civisme*) previously to a certain day. The florid and bombastic style in which he set forth the atrocious measures of the terrorists won for him the title of the Anacreon of the Guillotine. He was distrusted, however, by his associates, and was only saved from proscription by Robespierre, whose name nevertheless he was afterward one of the most zealous in defaming. Despite the violence of his ingratitude, a commission was appointed after Robespierre's fall to inquire into the conduct of Barère, Collot-d'Herbois, and Billaud-Varennes, and in March, 1795, they were sentenced to transportation. Barère was nearly torn to pieces by the mob on his way to jail. He escaped from prison, and was chosen to the corps législatif in 1797; but the election was declared null, and his arrest was ordered again. He remained in hiding until after the 18th Brumaire, when he was included in the amnesty. He was employed by Fouché to write pamphlets in the interest of Bonaparte, and the first consul made him the editor of the *Mémorial anti-britannique*. The paper failed, but Barère had in the mean time become one of the writers for the *Moniteur*. During the hundred days he was called to the house of deputies, and published the *Théorie de la constitution de la Grande Bretagne*, which produced a great impression. On the second return of the Bourbons he was banished as a regicide, and took refuge in Belgium. After the revolution of 1830 he returned to France, and was in 1832 elected deputy, but on account of some informality his election was declared void. He became a member of the general council of his department, and resigned in 1840. He published a great number of historical, political, and miscellaneous works, and two volumes of *Mémoires* (Paris, 1884), a new edition of which appeared in 1848.

BARETTI, Giuseppe, an Italian writer, born in Turin, March 22, 1716, died in London, May 5, 1789. He was intended by his father for the bar, but, disliking the study, took to literature. After travelling in southern Europe he went in 1751 to London as a teacher of Italian, became intimate with Dr. Johnson, and published the "Italian Library," in which he gave an account of the principal authors of his native country. He afterward spent nine years on the continent, wrote an excellent book of "Travels through England, Portugal, Spain, and France," and established at Venice the *Frusta letteraria*. ("Literary Scourge"), which he made so personal that he was obliged to leave the city. Returning to London in 1769, he stabbed a man in a street brawl and was tried for murder, but acquitted, Johnson, Burke, and Gar-

rick testifying to his inoffensive character. He was for several years foreign corresponding secretary of the royal academy. He published an English-Italian and Italian-English dictionary, which is still in high esteem; an Italian and English grammar; a Spanish and English dictionary; "Introduction to the most useful European Languages;" "Account of the Manners and Customs of Italy," &c.

BARGAIN AND SALE, a contract in relation to real estate, which has introduced a form of conveyance now generally used in England and this country. By the ancient English law, there could be no transfer of lands without livery of seisin, which was an actual or constructive delivery of possession by a prescribed formality. A sale of lands in any other mode did not change the title, but it was held that if a pecuniary consideration had been paid, a contract of sale would raise a use for the benefit of the vendee, or in other words, that the effect would be that the vendor would hold the lands for the use of the vendee, and could be compelled to account for the profits. The statute 27 Henry VIII., called the statute of uses, annexed the possession to the use, or executed the use, as the lawyers expressed it, thereby making the party for whose use the lands were held, technically called the *cestui que use*, the complete owner of the lands. By the same statute it was required that a deed of bargain and sale should be enrolled in one of the courts of Westminster, or in the county where the lands lay, which furnished the suggestion of the practice now universal in this country of recording deeds. The effect was that in cases of freehold—the statute of uses being held not to apply to lesser estates—the deed of bargain and sale transferred a complete title without livery of seisin; and that form of conveyance in consequence was brought into common use. (See *TRUSTS*, and *USES*.)

BARGE, an old town of Piedmont, at the foot of the Monbracco, about 30 m. S. W. of Turin; pop. about 7,000. It has a college, a good trade, manufactories of firearms, and slate quarries. It suffered severely from an earthquake in 1808.

BARHAM, Richard Harris, an English humorist, born at Canterbury, Dec. 6, 1788, died in London, June 17, 1845. He was educated at London and Oxford, studied law, but afterward devoted himself to theology, took orders, and obtained a living in Kent. While confined with a broken leg, he wrote a novel called "Baldwin," which attracted little notice. In 1821 he was elected minor canon of St. Paul's cathedral, and removed to London. His leisure was there devoted to writing for Gorton's "Biographical Dictionary," and occasional pieces for periodicals, and contributing to "Blackwood's Magazine" a serial story of college life entitled "My Cousin Nicholas." In 1824 he was appointed priest of the chapel royal, and presented to the united metropolitan livings of St. Mary Magdalene and St.

Gregory by St. Paul. In 1837, on the establishment of "Bentley's Miscellany," Mr. Barham contributed, under the pseudonym of Thomas Ingoldsby, the "Ingoldsby Legends," a series of humorous stories, chiefly in verse, which became very popular. Three volumes of these legends were finally collected, to the last of which was prefixed a life of the author. In 1840 Mr. Barham succeeded for a year to the presidency of Sion college. In 1842 he was promoted to the divinity readership of St. Paul's, and allowed to exchange his living for that of St. Faith.

BARI (anc. *Barium*), a seaport of Italy, on a small peninsula of the Adriatic, capital of the province of Terra di Bari, 140 m. E. of Naples; pop. in 1872, 50,524. It is surrounded by strong walls and further defended by an old Norman castle nearly a mile in circuit. It has a good harbor, carries on an active trade with Trieste and the Dalmatian coast in corn, oil, wine, &c., and is environed by extensive olive and almond plantations. The priory of San Nicolò in Bari is a magnificent old structure in the Lombard style, founded in 1087 for the purpose of receiving the remains of St. Nicholas, which were brought from Myra in Lycia and deposited in a splendid crypt. Roger II. was here crowned king of Sicily; and Bona Sforza, queen of Poland, was buried in a vault of the church in 1557. The cathedral of San Sabino was once a fine Gothic structure, but has been spoiled by modern repairs. In the time of Charlemagne Bari was the principal stronghold of the Saracens on the Adriatic. About 870 it was taken by the emperor Louis II. after a siege of four years. In the 10th century it was held by the Greek emperors, who made it the seat of the governor of all the Greek possessions in Italy. In the 11th century it was taken by the Normans under Robert Guiscard.

BARI, or **Baris**, a negro tribe of Gondokoro and other places on the White Nile, savage in character and excessively brutal in appearance. Sir Samuel Baker says in his "Albert N'yanza" (1866): "The women are not prepossessing, but the negro type of thick lips and flat nose is wanting; their features are good, and the woolly hair alone denotes the trace of negro blood." The only hair upon the heads of the men is a small tuft, in which they stick feathers. Their villages are circular. They inhabit a region capable of the highest cultivation. Goats, sheep, and cattle are very small, but extremely prolific. The poorer classes are employed in fishing and in manual labor. They live under chieftains in a patriarchal fashion, practise polygamy, and are under the influence of weather prophets and doctors. The hut of each family is surrounded by an impenetrable hedge of euphorbia, the interior generally consisting of a yard plastered with a cement of ashes, cow dung, and sand. When not at war with the slave and ivory traders, they are generally at war among themselves.

BARI, *Terra di*, a province of S. Italy, bounded N. E. by the Adriatic, and on the other sides by the provinces of Capitanata, Basilicata, and Terra d'Otranto; area, 2,295 sq. m.; pop. in 1871, 604,518. The southern part is crossed by a ridge from the Apennines, which affords little else but pasturage; but the lower lands are fertile, and wheat is produced in great quantities; the other crops are olives, tobacco, cotton, flax, and fruits. Wine and oil are largely manufactured, and along the coast there are extensive fisheries and salt works. Ship-building is carried on to some extent. Terra di Bari formed the portion of ancient Apulia known as Apulia Peucetia, and was traversed by the Appian Way. Capital, Bari.

BARILLA (Span. *barrilla*), or *Soda Ash*, a crude carbonate of soda, procured by the incineration of the *salsola soda*, *salicornia*, and other plants which are cultivated for this purpose in Spain, Sicily, Sardinia, and the Canary Islands. In Alicante the plants are raised from seed, which is sown at the close of the year in salt marshes near the coast, and they are usually fit to be gathered in September following. In October the plants are dried like hay, and then burned in holes in the ground capable of containing a ton or a ton and a half of soda. Iron bars are laid across these cavities, and the dried plants, stratified with dry seeds, are placed upon them. The whole is set on fire, and the crude soda runs out in a red-hot fluid state and collects in the bottom of the pit. As fast as one portion is consumed fresh material is added, until the cavity is filled with the alkali. The holes are then covered with earth, and the soda is allowed to cool gradually. The spongy mass, when sufficiently cold, is broken up and packed for shipment without further preparation. It rarely contains more than 20 per cent. of carbonate of soda; the impurities are chiefly common salt and sulphates of soda, lime, and alumina, with some free sulphur. Soda ash is now manufactured artificially from common salt according to the method of Le Blanc. Kelp, made from the drift sea plants of the north of Scotland and Ireland, and varec on the northern coast of France, of similar origin, are still more impure than barilla. The principal uses of barilla are to furnish the alkali required in the manufacture of glass and soap.

BARIMA, a river of South America, rising in the Imataca mountains of Venezuela, flowing E. into British Guiana, and then N. W. to the estuary of the Orinoco, which it enters just W. of the headland of Barima, in lat. 8° 46' N., lon. 60° W. Sixty miles above its mouth a natural canal 8 m. long connects it with the Guaini, a stream navigable for 70 m., having a depth of from 4 to 11 fathoms. The country bordering both streams abounds in the valuable black mora timber, and a great variety of other useful wood, as the bullet tree, red cedar, lancewood, silverballa, &c. The climate of this region is extremely unhealthy.

BARINAS, or *Varinas*. I. An inland state of Venezuela, bounded N. W. by a chain of the Andes, which separates it from Merida and Trujillo; area, 24,000 sq. m.; pop. about 126,000. The larger portion of the state is composed of delightful savannas, with luxuriant pasture for innumerable herds of cattle, flocks of sheep, and droves of asses and mules. The hill country in the W. part presents gentle declivities, which are very fertile; the mountain slopes and surrounding tracts are covered with virgin forests; while above the temperate line are cold regions terminating in arid paramos, extending into the states of Merida and Trujillo. The beautiful valleys of Barinas are watered by the Portuguesa, Boconó, Guanare, Uribante, Caparro, Surepá, Santo Domingo, Masparro, Pagney, and Canagua rivers, all tributaries of the Apure, which flows on the S. border. The principal products are coffee, cacao, cotton, indigo, excellent tobacco, and an endless variety of tropical fruits. II. A city, capital of the state, on the right bank of the river Santo Domingo, 262 m. S. W. of Carácas; pop. about 12,000 (in 1839, 4,000). This city, which has twice changed its site, was founded in 1576 by Juan Andrés Varela, and first named Altamira de Cáceres, in honor of the governor of that name. It was once in a prosperous condition; but during the wars of independence it was besieged, sacked, and laid in ruins by the royalists. It has made rapid progress, however, of late years. Barinas has a church, a hospital, and some schools; the houses are remarkably neat; the streets are regular and clean; and its name is famed in European markets for the superior quality of its tobacco, the chief article of export. Its shipping point is Toruno, a small town 14 m. distant, at the head of river navigation.

BARING, the name of a mercantile family of London. JOHN BARING came from Bremen, and settled in Exeter in the first part of the 18th century. He had four sons, two of whom, John and Francis, established the house of Baring Brothers and company in London in 1770. I. Sir **Francis**, born April 18, 1740, died Sept. 12, 1810. Having been elected director of the East India company, he became a zealous supporter of Mr. Pitt's policy, and was rewarded with a baronetcy in May, 1798. His "Observations on the Establishment of the Bank of England" (1797) had great weight in the question of renewing the charter of that institution. Three of his sons, Thomas, Alexander (see ASHBURTON), and Henry, had already been associated in the business; but Henry (died April 18, 1848) quitted it and accompanied Lord Macartney in his embassy to China, and afterward took the superintendence of the East India company's factories at Canton. II. Sir **Thomas**, eldest son of Sir Francis, born June 12, 1772, died April 3, 1848. He sat from 1830 to 1832 in the house of commons, and was known to the public as a patron of art and by his fine collection of

pictures. III. **Francis Thorsell**, a lawyer and statesman, eldest son of Sir Thomas, born April 20, 1796, died Sept. 6, 1866. He entered parliament as member for Portsmouth in 1836; was a lord of the treasury from 1830 to June, 1834; a secretary of the treasury from June to November, 1834, and from April, 1835, to 1839; chancellor of the exchequer from 1839 to 1841; and first lord of the admiralty from January, 1849, to the dissolution of the Russell ministry in March, 1852. In January, 1866, he was created Baron Northbrook. He never took an active part in the business of the firm. IV. **Thomas George**, second Lord Northbrook, eldest son of the preceding, born in 1826. He is a graduate of Oxford, and was a lord of the admiralty in 1857-'8, under-secretary of state for India in 1859-'61, and under-secretary for war in 1861-'6 and 1868-'72. He was a member of parliament for Penryn and Falmouth from 1857 to 1866, when on the death of his father he succeeded to the peerage. In February, 1872, after the assassination of Earl Mayo, he was appointed viceroy and governor general of India. V. **Charles**, another son of Sir Thomas, entered the church, became bishop of Gloucester and Bristol in 1856, and was translated to the see of Durham in 1861.

BARING-GOULD, *Salmie*, an English clergyman and author, born at Exeter in 1834. He is a descendant of Charles Baring, brother of the first Lord Ashburton. He was educated at Clare college, Cambridge, where he took his degree in 1856. In 1862 he visited Iceland for the purpose of studying the Norse tongue, and in 1863 published "Iceland: its Scenes and Sagas." In 1865 he took orders, and for a while was curate at Horbury near Wakefield. His present parish is Dalton, near Thirsk (1872). His remaining works are: "Post-Medieval Preachers" and "The Book of Were-Wolves" (1865); "Curious Myths of the Middle Ages" (1869); "In Exitu Israel," a historical novel (1870); "The Origin and Development of Religious Belief," in two parts, the first treating of "Heathenism and Mosaism," and the second of "Christianity" (1870); the "Golden Gate" (1869-'70); and "Legends of the Patriarchs and Prophets" (1871).

BARIUM, one of the metallic elements. The mineral known as heavy spar was first mentioned in 1602 by an Italian cobbler of Bologna, Vincenzio Cascariolo, who discovered that when this mineral was fused with resin and charcoal it became phosphorescent. The Bologna phosphorescing stone, or *lapis solaris*, soon became famous all over Europe, and marvellous cures were sometimes attributed to it. The true composition of the heavy spar was not known till 1760, when Marggraf showed that it contained sulphur. That the mineral contained an earth was first made known by Scheele and Gahn in 1774. Berzelius, and almost simultaneously Pontin and Davy, obtained in 1808 an amalgam of barium, which

Davy subsequently decomposed by distillation and thus isolated the metal. More recently Bunsen and Matthiessen have prepared barium from the fused chloride by means of electrolysis. Bergman introduced the word heavy spar, *terra ponderosa*, and Guyton de Morveau substituted the Greek *barys*, heavy, from which he derived the word *barote*, which was afterward changed to baryta, while the metal was called barium.—For the preparation of barium, anhydrous chloride of barium is mixed with sal ammoniac and fused in a Hessian crucible. A small porcelain crucible is then filled with the fused mass, and so attached to the poles of a battery of six Bunsen's cups as to be readily decomposed when brought to a state of fusion. The barium is obtained in a fine brass-yellow powder, which must be stored under naphtha, as it oxidizes rapidly in the air and decomposes water at all temperatures. Alloys of barium with bismuth, tin, and aluminum have been prepared; they are crystalline, and decompose water at all temperatures, but have no application in the arts. The compounds of barium are numerous, and have extensive use in medicine, chemistry, and technology. The oxide has been employed as a substitute for lime in the manufacture of glass, also to prevent the fermentation of the molasses of sugar cane. The binoxide has been proposed as an agent for the manufacture of oxygen from the atmosphere. If the protoxide be heated in a tube and a current of air be passed over it, it absorbs oxygen, which it again gives up on raising the temperature. It was at one time thought that the process could be made continuous, but experience has shown that the baryta melts and refuses to take up more oxygen. This can in a measure be prevented by previously mixing it with manganese dioxide and soda. By adding concentrated sulphuric acid to the binoxide of barium and gently warming, oxygen gas in the form of ozone is liberated.—As the native sulphate of baryta is generally too impure to be used directly in the arts, it is fused with charcoal and resin or oil, and the pure white sulphate obtained from the dissolved residue by the addition of sulphuric acid. Thus prepared, sulphate of baryta is used as a permanent white, under the name of *blanc fixe*, in the manufacture of paper, as a white pigment, and to adulterate white lead. As the specific gravity of heavy spar ranges from 4.3 to 4.7, it is frequently mistaken for the ore of copper or lead. *Blanc fixe* hardens when mixed with soluble glass, and is therefore capable of use in fresco painting. It is also used in making brilliant white satin paper.—Chloride of barium can be readily made by dissolving the native carbonate in hydrochloric acid. It is a valuable reagent in the laboratory for the detection of sulphuric acid, and in medicine as a remedy in scrofulous complaints. Several cases of poisoning by means of this agent are on record. The chloride and the oxalate are manu-

factured into anti-incrustation powders. A very good blasting powder is made of the nitrate of baryta, which, being much cheaper than the ordinary nitre powder, has long been employed in mines and on public works in Europe. It is not considered so dangerous as common powder, and, although slow in action, is found to be effective enough for all practical purposes.—Baryta salts are used in Belgium in the preparation of citric acid, tartaric acid, and hydrocyanic acid. In the manufacture of alum it has been found that the aluminate of baryta can be very readily prepared by fusion, from which alumina salts can be easily separated. This method is employed in France, in making alum from bauxite. Prussian blue, made from potash salts, can be prepared in a ready and cheap way through the intervention of cyanide of barium. Chromic acid is more cheaply prepared by the aid of baryta than in any other way. Stearic acid, from which adamantine candles are made, can be combined with and afterward easily separated from this substance. Baryta is also used in the preparation of starch sirup, so frequently sold as liquid honey; spirits of hartshorn or ammonia; a beautiful yellow paint, often employed as a substitute for chrome yellow, on account of its delicacy of tone and cheapness; soap, and an infinite number of other substances. Some of the best English plate glass has been made by substituting carbonate of baryta for carbonate of soda. It is a clear crystal sheet, and not liable to atmospheric changes. This glass has also been found to be admirably adapted for optical instruments. The soluble salts of baryta are poisons, the readiest antidote being sulphate of soda or magnesia.

BARK, the outer covering of trees and plants. It is found in its complete form only in the exogenous and gymnospermous classes, in which it consists of three portions, often quite distinct, but generally closely blended: the liber or inner bark (*endophlæum*), the cellular tissue or green layer (*mesophlæum*), and the corky envelope (*epiphlæum*). The liber, or fibrous bark, consists of bast cells, long, with thick walls, formed of cellulose; liber cells, thin-walled, of ordinary parenchyma, marked with reticulated spots, and seldom if ever absent from the liber; and laticiferous tubes, containing various secretions. The cellular envelope, which usually disappears after the second year, is formed of loose parenchyma, giving the bark its green color. The suber, or corky envelope, consists of cork, formed of parenchymous cells with thin walls and rectangular section, soon dead and empty; and periderme, of flat, thick-walled cells united in layers. The epidermis or outer skin is not permanent, but breaks away as the layers beneath it expand. The bark serves as a channel through which the sap elaborated by the leaves descends to feed the cambium layer, with which the bark is continuous, and by which it grows in annual rings, as does the wood itself. The medullary rays also con-

nect the bark and wood and afford channels for the deposit of the solid contents of the wood cells. From this it follows that while the youngest part of the wood is on the outside, the youngest part of the bark is on the inside; and when the newly formed cells are gorged with sap in the spring the bark may be readily separated from the wood; the newly formed cells are also the first to decay in the dead wood. The course of the sap is seen by cutting horizontally through the bark, when the upper edge of the cut will be moistened with the oozing sap, while the lower is nearly dry. Cutting off entirely the circulation of sap, as in girdling, destroys the tree. Bark may be reduced to extreme thinness, as in the grape vine, which sheds its liber annually, or be very thick, as in the *sequoia gigantea*, where it attains a thickness of two feet. The fibres, usually called bast (see BAST), are sometimes wanting, and are sometimes found in the woody portion of the stem. When present they are frequently limited to the young plant. They are of use when tenacious for cordage, many barks well supplying the place of ropes even in the construction of bridges. The leatherwood (*dirca palustris*), and the inner bark of the white cedar, are used in this country in place of hempen cordage, and the fibres may be soaked and felted into a cloth or paper, as in the tapa of the Pacific islanders. In the West Indies a remarkably tough bark called *mihagua* is in general use for a great variety of purposes, and the hibiscus fibres are well known throughout the tropics. The corky envelope occurs on many trees, but attains a remarkable thickness on certain species of the oak. (See CORK.) Bark contains many of the secretions of the sap, and thus has many economic uses as a reservoir of vegetable products. The Peruvian bark (see CINCHONA) is the source of quinine; the Angostura bark (*galipea officinalis*), canella bark (from *C. alba*), cascarilla (*croton cascarilla*), and other species, are well known drugs. Cinnamon is the bark of *cinnamomum Ceylonicum*, a lauraceous tree, native of Ceylon. Quercitron bark is the yellow dyestuff of *quercus tinctoria*. From the tannin which barks contain, especially oak and hemlock barks, arises their importance in the making of leather.

BARKER, Ferdce, M. D., an American physician, born in Wilton, Maine, May 2, 1819. He graduated at Bowdoin college in 1837, studied medicine at Harvard university, Edinburgh, and Paris, taking his degree at Paris in 1844. In 1845 he commenced practice at Norwich, Conn., and became professor of midwifery in Bowdoin college. In 1850 he became professor of midwifery in the New York medical college, and in 1856 he was elected president of the New York state medical society, and in 1860 was chosen professor of clinical midwifery and diseases of women in Bellevue hospital medical college. He is the author of a work on puerperal diseases (1872).

BARKER, Jacob, an American financier, born at Swan Island, Kennebec county, Maine, Dec. 7, 1779, died in Philadelphia, Dec. 26, 1871. He was of a Quaker family of Nantucket, and connected on the mother's side with Franklin. At the age of 16 he went to New York, where he got employment with Isaac Hicks, a commission merchant, began to trade on his own account in a small way, and before his majority was in possession of four ships and a brig, and had his notes regularly discounted at the United States bank. In 1801 he lost nearly all his fortune by a series of mishaps in business. Not long afterward, however, he entered into a contract with the government for the supply of oil, and again accumulated considerable wealth. He received the consignment of the first steam engine used on the Hudson river. The war of 1812 coming on, he took the democratic side in politics, engaged to raise a loan of \$5,000,000 for the government, was one of the building committee of Tammany hall, and took part in the first meeting held in it. He became senator of the state of New York, and when sitting in the court of errors he delivered an opinion in opposition to that of Chancellor Kent, in an insurance case, in which he was sustained by the court. He soon afterward established the "Union" newspaper to advocate the election of Gov. Clinton. In 1815 he founded the Exchange bank in Wall street, and began to speculate in stocks. The bank broke in 1819, but he made use of other institutions chartered in different states, and for many years, by the extent of his operations, was thought to have the control of great capital. In the extensive transactions in which he now engaged, he came into frequent and violent collision with other capitalists, and called forth much opposition. On the failure of the life and fire insurance company, he was indicted, with others, for conspiracy to defraud, and defended himself in person with great ability. At the first trial the jury disagreed; on the second he was convicted, but a new trial was granted. After the third the indictment was quashed. In 1834 he removed to New Orleans, where he studied law and was admitted to the bar, after being unsuccessful on his first examination. Here he took a prominent part in politics and business, and had again accumulated a fortune when the civil war began. By this he was so impoverished that in 1867 he was in bankruptcy, and he ended his career in comparative poverty.

BARKING, a market town and parish of Essex, England, 6 m. E. of London; pop. of the town in 1871, 6,574. It is on a navigable creek near the Thames, and is inhabited chiefly by fishermen, bargemen, and market carriers. Barking abbey, one of the oldest and richest nunneries in England, was founded about 677. In 870 it was burnt to the ground and the nuns were killed or dispersed by the Danes. In the 10th century it was restored by King Edgar. Several queens of England and other noble

ladies were among its abbesses. The abbess of Barking was one of the four persons who were baronesses *ex officio*. Under Henry VIII. it was suppressed and the abbess and nuns were pensioned, and Charles I. sold the estate. Hardly a vestige of the building remains.

BARLÆUS, Gaspar. See **BAERLE**.

BAR-LE-DUC, or *Bar-sur-Ornain*, the capital of the department of Meuse, France, and in the middle ages of the duchy of Bar, on the

Ielands. Barletta is supposed to occupy the site of a Greek town called Barduli. While it was besieged by the French in 1503, a combat was fought by challenge between 18 French and 18 Italian cavaliers, respectively under Bayard and Prospero Colonna. At the first collision seven of the French knights were unhorsed, but Bayard and his remaining comrades fought with such skill that the tournament ended as a drawn battle.

BARLETTA, Gabriele, an Italian preacher, born at Barletta, lived in the second half of the 15th century. He was a Benedictine monk, and rendered himself very famous both by his eloquence and eccentricity. He had a habit of inserting between the clauses of the liturgy practical comments and sharp personal illustrations. Though his style of preaching was not in good taste, it was very effective, and the esteem in which he was held was expressed by the proverb, *Nescit prædicare, qui nescit barlettare*. A collection of

Bar-le-Duc.

Ornain, 125 m. E. of Paris, on the railway from Paris to Strasburg, and the canal from the Marne to the Rhine; pop. in 1866, 15,834. The old town was anciently fortified, with a strong castle of the dukes of Lorraine, the ruins of which are yet to be seen, and had some historical importance, being the capital of the duchy of Bar, and the birthplace of Francis, duke of Guise, surnamed *le Balafré*, of Marshal Oudinot, and Gen. Excelmans. It contains some old public buildings; in one of the churches is the celebrated monument of René de Châlons, prince of Orange, by Richier, pupil of Michel Angelo. The new town, which stands lower on the river bank, has establishments for manufacturing cotton stuffs, handkerchiefs, hosiery, hats, and jewelry, with tanneries. Its preserved fruits, and especially its *confitures de groseilles*, are highly esteemed, as well as its sparkling wine. The Ornain being navigable from the town, it has a considerable trade in forwarding timber, wine, and other articles for the supply of Paris.

BARLETTA, a walled town and seaport of S. Italy, in the province of Terra di Bari, on the Adriatic, 33 m. N. W. of Bari; pop. in 1872, 28,163. It has wide streets, a colossal bronze statue supposed to be of the emperor Heraclius, and a Gothic cathedral in which Ferdinand I. of Aragon was crowned. There is a good harbor, partly artificial, and considerable commerce is carried on with Greece and the Ionian

his sermons passed through about 20 editions.

BARLEY (*hordeum*), a grain more widely distributed and generally used than any other, and from the most remote times an important article of the food of man. Pliny speaks of it as the first grain cultivated for nourishment. It is adapted to hot and cold climates, in the for-

Hordeum vulgare.

Hordeum hexastichum.

mer being obtained in two successive crops in a season. Where it originated is not known, but the plant grows wild in Sicily and the in-

terior of Asia, and the common species is stated by Pursh to occur apparently wild in some parts of the United States. The barley cultivated in this country is of two species, *H. vulgare* and *H. distichum*, the grains of the former being arranged in four rows, and of the latter in two. A third species is cultivated in Europe, *H. hexastichum*, also called the autumn and winter barley. This has six rows of grains, each row terminating in a long beard. This is always sown in the fall, and ripens the first in the summer. Its grains are small, but the yield is large—sometimes 20 for 1. The Scotch bere or bigg is of this species. *H. distichum*, or English barley, originally from Tartary, has no grain beard, is more productive than the other kinds, and succeeds in almost all soils. The grain is excellent feed for cattle and barnyard stock. The crop in

Hordeum distichum.

Great Britain is from 28 to 40 bushels to the acre, the weight of the bushel being from 50 to 54 lbs., according to the quality of the grain. The total production of barley in the United States in 1870 was 15,825,898 bushels. In California it is next to wheat the most important grain crop, sometimes yielding largely for five successive years without renewed sowing; its production in 1870 was 4,415,426 bushels. The next largest crop was in New York, 4,186,668 bushels; then follow Ohio, 1,663,868; Illinois, 1,036,338; Maine, 802,108; Wisconsin, 707,807; and Pennsylvania, 580,714. In most of the other states, especially of the south, the production is small.—Barley hulled and ground makes a coarse, heavy kind of bread, and is very extensively employed in the manufacture of beer, and to some extent for medicinal purposes. Barley corns are of an oval, elongated shape, pointed at one end and obtuse at the other, and marked with a longitudinal furrow. Their color externally is yellowish, but within they are white. Stripped of their outer covering or husk, and rounded and polished in a mill, the grains are pearly white, and are then known as pearl barley. This is the form in which they are always kept by druggists. Barley flour analyzed by Einhoff was found to contain, in 1,000 parts, starch, 720 parts; sugar, 56; mucilage, 50; gluten, 86.6; vegetable albumen, 12.3; water, 100; phosphate of lime, 2.5; and fibrous or woody matter, 68. The quality of the grain is judged of by the quantity of water it absorbs when steeped in it; 100 lbs.

of good barley gain by absorption 47 lbs. of water.—From the times of Hippocrates and Galen, barley drinks have been in high repute in febrile and inflammatory complaints. They possess mild, soothing qualities, while at the same time they impart nourishment.

BARLOW, Joel, an American poet and politician, born at Reading, Conn., in 1755, died near Cracow, Poland, Dec. 22, 1812. He was educated at Dartmouth and Yale colleges, and during his latter vacations took part in the opening scenes of the revolution, fighting valiantly, it is said, in the battle at White Plains. At his graduation in 1778 he read a poem upon the prospect of peace, which, with another poem delivered on occasion of taking his master's degree, was published in the Litchfield collection of American poems. He began the study of law upon leaving college, but the army being at that time deficient in chaplains, he was persuaded to study theology, and after six weeks' preparation was licensed a Congregational minister, and joined the army, where he inspired the troops not only by his preaching but by patriotic songs and speeches. At the close of the war he resumed the study of law, and settled in Hartford, where he established a weekly newspaper, and prosecuted his poetical designs, adapting Watts's versions of the Psalms of David to the use of the general association of Connecticut, and adding to the collection several original hymns. His "Vision of Columbus" was published by subscription in 1787, received with favor, and reprinted in London and in Paris. In 1788 he went to England as agent of a land company, but learning that he had become associated with a party of swindlers, he resigned his office, repaired to Paris, and involved himself in revolutionary schemes. In 1791 he published in London the first part of his "Advice to the Privileged Orders," a vehement production, which was soon followed by a poem upon the "Conspiracy of Kings." The poem was suggested by the first continental alliance against France, and was introduced by a prose preface violently denouncing Mr. Burke as the author of the calamities of the time. He published a translation of Volney's "Ruins, or Reflections on the Revolutions of Empires," and in 1792 sent a letter to the national convention of France, in which he recommended an extremely popular government. He became associated with the constitutional reformers of England, and was at the same time one of a commission sent by France to organize the newly acquired territory of Savoy. At Chambéry he wrote an enthusiastic exhortation to the people of Piedmont to adopt the revolutionary principles of France, and there he wrote his humorous and most popular poem upon "Hasty Pudding." He made a fortune in France by commercial speculations, and after addressing two extravagant political letters to the people of the United States, he returned in 1805 and established himself in Washington. In 1806 he propounded a scheme

for a national academy under the patronage of government, and the next year his "Columbiad," the fruit of the labor of half his life, appeared in a style which made it the most costly publication that had yet been attempted in America, being illustrated by engravings executed by the best artists of London. A more elaborate and declamatory poem than his "Vision of Columbus," it yet never attained to the popularity of the latter. In its design it was simply a historical view of events from the time of Columbus to the scenes of the revolution, the great discoverer being represented as seeing them from his prison in Spain. In his latter years he was collecting materials for a history of the United States, and in 1811 was appointed by President Madison minister to France. His diplomatic skill was there in request, and Napoleon, perplexed by negotiations at the time of his Russian campaign, sent for him to meet him at Wilna. Barlow set off immediately, but died at a cottage in Poland before accomplishing his mission. His last poem, dictated from his deathbed, was a powerful expression of resentment against Napoleon for the hopes which he had disappointed.

BARLOW, or **Barlowe, William**, an English theologian, died Dec. 10, 1569. Before the reformation he belonged to the order of St. Augustine, was elected prior of the house at Bisham in Berks, and in 1535 was sent by Henry VIII. on an embassy to Scotland. Securing the favor of the king, he was successively appointed to the bishoprics of St. Asaph, of St. Davids, and of Bath and Wells. He formally left the Roman Catholic church, and married, and during the reign of Edward VI. he was distinguished for his Protestant zeal. Under Mary he lost his bishopric, and for a time his liberty, and retired to Germany till the accession of Elizabeth. In 1559 he was made bishop of Chichester, and continued in this see till his death. He left a work entitled "Cosmography," and several slight controversial treatises. He had a numerous family, and his five daughters all became the wives of bishops.

BARMECIDES (descendants of Barmek), a powerful family of Khorasan, attached to the Abbasside caliphs. One of them, Khaled ben Barmek, was tutor of Haroun al-Rashid. His son Yahya became the vizier of Haroun about 786, and contributed greatly to the renown of his master's reign. Of his sons, Fadhl was distinguished as a soldier and as minister of justice, and Jaffar figures in the "Arabian Nights" as the friend and confidant of Haroun. At the same time some 25 members of the family held important civil and military dignities. The downfall of the Barmecides took place about 803. Haroun, becoming jealous of the popularity and power of the family, and incensed, it is said, on account of the birth of a son of his sister Abassa, whom he had married to Jaffar on condition that the union should be merely platonic, caused Jaffar to be beheaded at Anbar, on the Euphrates; Yahya

and Fadhl were thrown into prison at Racca, where they died in chains, while nearly all their relatives were arrested and deprived of their property. Ibn Khaldun disputes the truth of this story, which in modern times has afforded a theme to poets and dramatists. To one of the Barmecides is attributed the famous feast in the "Arabian Nights," where the guest was served with only imaginary viands; whence the phrase "Barmecide feast."

BARMEN, an industrial town in Rhenish Prussia, closely adjoining Elberfeld, and 24 m. N. N. E. of Cologne. It is situated in the valley of the Wupper, and stretches along the Bergisch-Märkische railway over a distance of about 9 m. to the frontier of Westphalia. It is divided into Upper, Middle, and Lower Barmen, each of which consists of a number of small towns or villages which were formerly independent, and which even now, though all absorbed into the town of Barmen, retain their old names. In 1706 the population of the valley was only 2,500; in 1861 it was 49,740; and in 1871 it had risen to 74,496. The ribbon manufacture is the most important in Europe; and cottons, velvets, silks, chemical products, plated ware, &c., are produced. There is a gymnasium; also a seminary of foreign missions belonging to the Rhenish Westphalian missionary society.

BARNABAS, Epistle of, a work purporting to be written by St. Barnabas. It was known early in the Christian church, for it is cited several times by Clement of Alexandria and Origen, and mentioned by Eusebius and Jerome. For several centuries it was lost sight of, until Sirmond in the 17th century discovered it at the end of a manuscript of one of the epistles of Polycarp. About the same time Hugo Menardus discovered a Latin version of it in the abbey of Corvey. This was printed at Paris in 1645. The year before Archbishop Usher had received a copy of the MS., which he annexed to the Ignatian epistles; but a fire at Oxford destroyed all but a few pages. The work, both in Greek and in the Latin version, has been several times reprinted; among others, by Vossius in his "Ignatian Epistles" (1646); Russell, "Apostolic Fathers" (1746); Hefele, *Patrum Apostolicorum Opera* (1842). It has been translated into English by Wake, and several times into German. All these editions are from Sirmond's Greek text, in which were wanting the first four chapters and a part of the fifth, and from the Corvey Latin version, where the last five chapters were lacking. But in 1859 Tischendorf brought from Mt. Sinai a Greek MS. of the entire epistle, divided into 21 chapters, which was published in his *Novum Testamentum Sinaiticum* (2d ed., Leipzig, 1863). The best separate edition of the epistle is that of Hilgenfeld, with the ancient Latin version, notes, and a commentary (Leipzig, 1865). An English version, from the *Codex Sinaiticus*, appeared in the "Journal of Sacred Literature," October, 1868; reprinted in the

"American Presbyterian Review," January and July, 1864. A commentary on the epistle, by J. G. Müller, has been published as an appendix to De Wette's *Exegetisches Handbuch zum Neuen Testament* (Leipzig, 1869).—Many eminent critics, as Voss, Pearson, Wake, Lardner, Gieseler, Black, and others, hold that this epistle was written by Barnabas, the companion of Paul; but the current of recent opinion is against its authenticity. Among the objections urged against it are: 1. It speaks of the destruction of Jerusalem, and must therefore have been written after A. D. 70; whereas there is reason to believe that Barnabas was not living in 64, the earliest date assignable for the martyrdom of Paul. 2. The work bears internal evidence of having been written by a gentile, with no sympathy for the Hebrews. 3. Barnabas was a Levite, and presumably well acquainted with the Hebrew ritual, which the writer of the epistle in many places misrepresents. 4. His mode of interpretation is puerile and absurd. 5. He shows himself wholly unacquainted with the Hebrew Scriptures, and commits the blunder of representing Abraham as familiar with the Greek alphabet, which did not exist until centuries after his death. The most probable opinion is that it existed in the Alexandrian church at a very early period, and was written by some one who had studied Philo and adopted his allegorical mode of interpreting the Old Testament. Some critics put the probable time of its composition just after the destruction of Jerusalem; none judge it to be later than A. D. 120.

BARNABAS, Saint, a Christian teacher, noted for his early connection with the apostle Paul. His original name was Joses or Joseph. The surname Barnabas (Gr. *Βαρνάβας*, from Chald. *Bar-nebush*), signifies "son of prophecy," or "son of exhortation" (*ὁ υἱὸς παρακλήσεως*, Acts iv. 36). He was born in Cyprus of Jewish parents, and possessed of property, which he sold, giving the proceeds to the common Christian fund. As this occurred soon after the day of Pentecost, he must have been one of the earliest converts. When the tidings reached Jerusalem of the conversion of Saul, Barnabas was sent to Antioch, where a gentile church had been organized, to investigate the matter. He labored there with Paul for a year, and when a contribution was raised for the poor brethren of Jerusalem, it was sent up by Barnabas and Paul. They were soon despatched on a mission to Cyprus and Asia Minor. A controversy having arisen at Antioch respecting the obligation of gentiles to receive the rite of circumcision, they were deputed to lay the matter before the elders of Jerusalem. Their representations induced the elders to decide, notwithstanding the opposition of Peter, that the rite was not essential. Barnabas and Paul then proposed another missionary journey. Barnabas wished to take with them his nephew Mark. Paul objected to this, for some reason not assigned; but as Mark is afterward

spoken of as the special companion of Peter, it may be that he had sided with him in the controversy about circumcision. The dispute became so sharp that a separation took place, Barnabas and Mark going to Cyprus, while Paul, taking with him Silas, went through Syria and Cilicia. Beyond this, with the exception of three incidental allusions in the epistles of Paul, nothing is certainly known respecting Barnabas. From these it appears that he was unmarried, and supported himself, like Paul, by some manual occupation; and that he so far went over to the Judaizing party as for a time to keep aloof from communion with the gentile converts. From the fact that the heathen of Lystra called him Jupiter, while they styled Paul Mercury on account of his eloquence, it has been inferred that Barnabas was a man of imposing aspect and demeanor. There are numerous legends respecting him, none of which can be traced beyond the 6th century. According to one, he attempted to preach in the synagogue at Salamis, was dragged out and stoned to death, and an ineffectual attempt was made to burn his body. Mark rescued the body and buried it in a cave; but a persecution arising, the Christians were dispersed, and the knowledge of the place of interment was lost. Four centuries later a heretical attempt was made to set aside the orthodox bishop of Salamis. Barnabas three times appeared to the bishop in a vision, and told him where his body might be found, with a copy of Matthew's Gospel lying upon it. Search was made, and the body and book were found. A tradition wholly unsupported makes Barnabas the first bishop of Milan; but Ambrose does not mention him among the bishops who had preceded him in that see. The Roman Catholic church celebrates the festival of St. Barnabas on June 11. The church at Toulouse claims to possess his body, and there are eight or nine other churches which claim to possess his head. A spurious gospel attributed to Barnabas exists in Arabic, which has been translated into English, Spanish, and Italian. It appears to be a forgery by some heretical sect, with interpolations by Mohammedans. It was placed among the apocryphal books by Cotelierus in his edition of the "Apostolic Canon," and was formally condemned by Pope Gelasius II. in 1118.

BARNABITES, or Regular Clerks of St. Paul, a religious order, so called from the church of St. Barnabas in Milan, which was granted them in 1545. The order consists of two branches, formerly distinct, but united into one during the time of St. Charles Borromeo. The origin of the older branch, who were properly called Ambrosians, is uncertain, but is supposed to date from the pontificate of Gregory XI. (1370-'78). The younger branch was founded in 1533 by three priests, Zaccaria of Cremona, and Ferrari and Morigia of Milan, for the purpose of preaching and administering the sacraments among the populace of Milan, who had become

much corrupted by the continual presence of a multitude of German soldiers in the city, and who were also much afflicted by pestilence. In 1579 their constitutions and rules were fully revised and established, under the direction of St. Charles Borromeo. The mother house is at present in Rome, and the order has about 20 colleges in Italy, Austria, and France.

BARNACLE, a name commonly given both to the pedunculated and sessile cirripeda. By the older naturalists they were classed with the testaceous mollusca, the pedunculated forming the genus *lepas*, and the sessile the genus *balanus*; they are now recognized as belonging to the *articulata*. Those provided with the fleshy peduncle or footstalk, as well as those without it, are found firmly fixed below the level of the water to the surface of rocks, shells, and floating substances. Adhering to the bottoms of vessels, they are carried to almost all parts of the world and are found in all seas, even the

Arctic ocean. In warm climates particularly the barnacles attach themselves in such numbers to the bottom of vessels, especially of those not protected by copper, as often to retard their progress. Their bodies are enclosed in shells, white or of a purplish blue color; the peduncle is a fleshy worm-like stem, the extremity of which is fixed to the object upon which the animal is stationed. The food of the barnacles consists of small crustacea and mollusks; these are entangled by the many-jointed cirri which are perpetually thrown out and folded again, so as to serve the purpose of casting a net, which drags the prey to the mouth. The young are produced from eggs, which are discharged by the female in great numbers. On emerging from the egg they are quite free, possessing locomotive organs, and being furnished also with large lateral eyes. In due time a metamorphosis takes place, and, assuming the shapes and habits of their pa-

rents, they affix themselves to their future permanent place of residence. It would appear that the growth of these animals is very rapid, for a ship perfectly free of them will return after a short voyage covered with them below the water line. The flesh of some of the varieties of the barnacle was esteemed by the ancients, and at the present day the Chinese eat it. Except as to the obstruction of vessels, they seem to be perfectly harmless.—The barnacle was in ancient times supposed to produce the bird known as the barnacle goose. (See GOOSE.) It is from this fabulous connection with the goose that the generic name *anatis* of Lamarck (Lat. *anas*, duck) is still retained for the true barnacles, those furnished with the footstalk; and so of the name *anserifera* or goose barnacle of Linnaeus applied to one of the species of this genus, which is called *lepas*. (See CIRRIPODES.)

BARNARD, Frederick Augustus Porter, LL. D., an American scholar and educator, born at Sheffield, Mass., in 1809. He graduated at Yale college in 1828, became tutor there in 1829, in 1831 teacher in the asylum for the deaf and dumb at Hartford, and in 1832 in that of New York. From 1837 to 1848 he was professor of mathematics and natural philosophy in the university of Alabama, and afterward of chemistry till 1854. The same year he took orders in the Episcopal church. He then became professor of mathematics and astronomy in the university of Mississippi, of which institution he was elected president in 1856. In 1861 Dr. Barnard left Mississippi, and in 1864 he became president of Columbia college, New York, which office he still holds (1878). He was United States commissioner to the universal exposition at Paris in 1867, and published an elaborate "Report on Machinery and Industrial Arts" (New York, 1869). His other principal works are: "Treatise on Arithmetic" (1830); "Analytic Grammar with Symbolic Illustration" (1836), originating a system still used in the principal institutions for the deaf and dumb; various reports, essays, &c., on collegiate and university education, including a volume of "Letters on Collegiate Government" (1855); "History of the United States Coast Survey" (1857); "Recent Progress of Science" (1869); and "The Metric System" (1871). In 1860 he was a member of the astronomical expedition to observe the total eclipse of the sun in Labrador; in 1862 was engaged in continuing the reduction of Gilliss's observations of the stars in the southern hemisphere; and in 1863 had charge of the publication of charts and maps of the United States coast survey. In 1860 he was elected president of the American association for the advancement of science; in 1865 of the board of experts of the American bureau of mines; and in 1872 of the American institute. In 1855 he received the degree of LL. D. from Jefferson college, Miss., and in 1859 from Yale college; in 1861 that of D. D. from the university of Missis-

Goose Barnacles on a bottle.

Arctic ocean. In warm climates particularly the barnacles attach themselves in such numbers to the bottom of vessels, especially of those not protected by copper, as often to retard their progress. Their bodies are enclosed in shells, white or of a purplish blue color; the peduncle is a fleshy worm-like stem, the extremity of which is fixed to the object upon which the animal is stationed. The food of the barnacles consists of small crustacea and mollusks; these are entangled by the many-jointed cirri which are perpetually thrown out and folded again, so as to serve the purpose of casting a net, which drags the prey to the mouth. The young are produced from eggs, which are discharged by the female in great numbers. On emerging from the egg they are quite free, possessing locomotive organs, and being furnished also with large lateral eyes. In due time a metamorphosis takes place, and, assuming the shapes and habits of their pa-

ssippi; and in 1872 that of doctor of literature from the regents of the university of the state of New York. He is a member of various learned societies in America and Europe, and has been a contributor to the "American Journal of Education" from its commencement, and to Silliman's "American Journal of Science and Arts" since 1837.

BARNARD, Henry, LL. D., an American scholar and educator, born in Hartford, Conn., Jan. 24, 1811. He graduated at Yale college in 1830, studied law, and was admitted to the bar in 1835. From 1837 to 1840 he was a member of the legislature of Connecticut, and labored to secure the independence of the judiciary, the improvement of county prisons, the care of the insane poor, and the reorganization of common schools. From 1838 to 1842, and again from 1850 to 1854, he was superintendent of schools, and revolutionized the construction of school houses, established public high schools, teachers' institutes, and a normal school, and improved the system of school instruction. From 1843 to 1849 he was school commissioner of Rhode Island, and by repeated visits to and public addresses in different states he aided to set on foot similar reforms elsewhere. From 1857 to 1859 he was president of the state university of Wisconsin, and in 1865-'6 of St. John's college at Annapolis, Md. He labored to improve these institutions by consolidating them with other colleges, thus increasing their resources, by establishing public high schools, and by abridging the enforced course of study to two years, and extending the range of optional studies to the modern languages and sciences. From 1867 to 1869 he was United States commissioner of education, and brought about the national recognition of the educational interests of the whole country, for which he had labored since 1840. He has received the degree of LL. D. from Harvard, Yale, and Union colleges. Among his works, several of which have passed through many editions, are: "School Architecture" (1839); "National Education" (4 vols., 1840); "Normal Schools and Teachers' Institutes" (1850); "Educational Biography" (3 vols., 1857); "Papers for Teachers" (8 vols.); "Military Schools," and "Technical and Scientific Education." He has also conducted the following educational periodicals: "Common School Journal" (1838-'42); "Rhode Island School Journal" (1845-'49); "American Journal of Education" (Hartford, 1856 *et seq.*).

BARNARD, John Cross, an American military engineer, brother of President F. A. P. Barnard, born in Berkshire county, Mass., May 19, 1815. He graduated at West Point in 1833, and was assigned to the engineer corps, in which he has since served, having been promoted as follows: lieutenant, 1838; captain, 1838; brevet major, 1848; major, 1858; brigadier general of volunteers, 1861; brevet colonel, 1862; lieutenant colonel, 1863; brevet major general of volunteers, 1864; brevet brigadier general and bre-

vet major general of the regular army, March 13, 1865; colonel of the corps of engineers, Dec. 28, 1865. Up to 1846 he was employed as constructing engineer on the southern coasts and at New York and New Orleans. During the war with Mexico he fortified Tampico, and made surveys of the battlefields around the capital. In 1850-'51 he was chief engineer for the survey of the projected Tehuantepec railroad, and afterward acted as engineer of various public works. In 1855-'6 he was superintendent of the military academy at West Point, and for the next four years he had charge of the defences around New York. At the opening of the civil war he was intrusted with the fortifications around Washington, served as engineer for the army of the Potomac, and finally, on the staff of Gen. Grant, as chief engineer to the armies in the field. He was mustered out of the volunteer service in 1866; and, with the actual rank of colonel of the corps of engineers, he is a member of boards having in charge the fortifications and harbor and river obstructions of the territory of the United States. He has published "The Gyroscope" (1857), and "Problems in Rotary Motion" (1872), two very profound mathematical investigations; "Dangers and Defences of New York" (1859); "Notes on Seacoast Defence" (1861); "The C. S. A. and the Battle of Ball Run" (1862); and "Artillery Operations of the Army of the Potomac" (1863). In 1864 the degree of LL. D. was conferred upon him by Yale college.

BARNARD, Sir John, an English merchant, born at Reading, Berkshire, in 1685, died at Clapham, Aug. 29, 1764. His parents were Quakers, but at the age of 19 he left the sect, and was baptized into the church of England. He entered the counting-house of his father, a prosperous wine merchant, soon took the chief management of the business, became one of the most eminent traders of the metropolis, and was elected a member of parliament for the city of London, which he continued to represent during nearly 40 years. He generally opposed the administration of Sir Robert Walpole. In 1728 he was chosen an alderman of London; in 1732 was knighted, on presenting to the king a congratulatory address on his return from Germany; in 1735 discharged the duties of sheriff; and in 1737 became lord mayor. He formed a plan for reducing the national debt of England, which, deemed chimerical at first, was afterward adopted; and during the rebellion in Scotland in 1745 he assisted in maintaining public credit by agreeing with the leading merchants of London to receive the notes of the bank of England in payment of all debts. He retired from public life in 1758. A statue has been erected to him in the royal exchange.

BARNAUL, the chief town in the mining district of the Altai mountains in Siberia, lat. 53° 20' N., lon. 84° E., on the river Barnaulka, a small branch of the Obi, 230 m. S. by W. of

Tomsk; pop. about 12,000. All the gold obtained in Siberia must be sent to Barnaul to be smelted, with the exception of that yielded by the Yablonnoi mountains. The gold-washing begins in May and lasts till September, the metal being sent to Barnaul once or twice during the year. It then passes into the control of the government, which in time accounts to the miners for its value. The silver is not separated from the gold in Siberia, but the metal is sent for that purpose to St. Petersburg. The smelting works at Barnaul are on a large scale, and are conducted in the most approved scientific manner. The governor of Tomsk, who is always chosen from the mining engineers, is required to visit every mine and smelting works at least once in two years. Exploring expeditions are sent out every spring, to prospect in the mining regions. At Barnaul there is a magnetic observatory, whence observations are regularly forwarded to St. Petersburg. There is also a museum, containing a good collection of Siberian minerals, animals, and birds. The market is well supplied. The workmen live in small wooden cottages, and nearly all the peasants own cows and horses.

BARNAVE, Antoine Pierre Joseph Marie, a French revolutionist, born at Grenoble, Oct. 22, 1761, guillotined at Paris, Nov. 29, 1793. He was educated for the law, and at the age of 22 he was chosen by the bar of Grenoble to pronounce a discourse at the closing of the parliament; his subject was the "Division of Political Powers." He distinguished himself in 1788 by a pamphlet against certain arbitrary measures of the king; and a few months after he was elected a deputy of the third estate in the states general which met at Versailles, May 4, 1789. He supported the movement for a national assembly, the formation of the national guard, the abolition of all feudal privileges, the declaration of the rights of man, the secularization of the church estates, the emancipation of the Jews, the abolition of religious orders, and the abolition of negro slavery; and opposed the absolute veto of the king, the eligibility to office of members of the national assembly, and the conferring on the king the right of making peace and war. On the last two questions he separated from Mirabeau. In October, 1790, he was made president of the assembly. On May 11, 1791, he proposed that no change should be made in regard to slavery without the consent of the planters; he was opposed by Robespierre, Sieyès, and Grégoire, and defeated. On the flight of the royal family and their arrest at Varennes, he was sent with Latour-Maubourg and Pétion to bring back the captives to Paris. From the date of this event he was totally changed. He became the advocate of the king and queen, and maintained constant relations with the latter, endeavoring to bring them into unison with the constitutional party in the assembly. He defended the inviolability of the royal person, opposed the proposition to give soldiers the

right of denouncing their officers, spoke in behalf of priests who denied the authority of the assembly, and moved the order of the day on the question of the right of the assembly to dismiss the ministers. He retired to Grenoble in January, 1792, and devoted himself to political philosophy and literature until Aug. 29, when he was arrested on account of a pamphlet found in the king's cabinet. He was kept 10 months in prison at Grenoble; was transferred to Paris, Nov. 3, 1793, and was tried before the revolutionary tribunal Nov. 28, and guillotined the next day. His last words to the people about the scaffold were: "Behold the reward for all that I have done for liberty." A statue was erected to him in the senate house under the consulate, but on the restoration of the Bourbons it was removed. His works have been collected in four volumes by M. Béranger (de la Drôme).

BARNEGAT. I. A post village of Union township, in the S. part of Ocean county, N. J. It lies on Double creek, near the inlet of that name, 1 m. from Barnegat bay. It has excellent sea bathing, and an abundance of wild fowl. **II.** A bay on the E. border of Ocean county, N. J., extends N. from below Barnegat inlet to the mouth of Metetecunk river. It is about 28 m. long, and from 1 to 4 m. wide. Metetecunk, Toms, and Forked rivers, and Kettle and Cedar creeks, discharge into it. Squan beach and Island beach, strips of sandy land from a quarter of a mile to a mile in width, separate it from the ocean. Its entrance is about a mile wide.

BARNES, Albert, an American theologian, born at Rome, N. Y., Dec. 1, 1798, died in Philadelphia, Dec. 24, 1870. He graduated at Hamilton college in 1820, intending to become a lawyer; but considering it his duty to enter the ministry, he studied at the Princeton theological seminary, and in 1823 was licensed to preach. He officiated in various churches till 1830, when, being pastor of the Presbyterian church of Morristown, N. J., he was called to the first Presbyterian church of Philadelphia, in which charge he remained till 1867, when he resigned it in consequence of failing health and the almost total loss of his eyesight. Mr. Barnes was distinguished as an eloquent preacher and faithful pastor, and was the author of many books. He is best known by his "Notes" on various parts of the Scriptures, originally prepared as lectures to his own congregation. The book of Psalms was always a favorite study, and his notes upon this are highly esteemed (new ed., 8 vols. 12mo, New York, 1868-'9). He also published notes on Job, Isaiah, and Daniel. But his reputation as a commentator rests mainly upon his notes on the New Testament, comprising the Gospels, the Acts, and all the Epistles. They are especially adapted for the use of Sunday schools and Bible classes, and have been widely adopted in the United States and in Great Britain. No other works of this class have ever had so wide a circulation. Several editions have been published, with

slight emendations; and at his death he had completed a new revision, with additions, embodying the results of the latest researches. The publication of this edition was completed in 1872 (6 vols. 12mo, New York). During the discussions which led to the temporary disruption of the Presbyterian church, Mr. Barnes was arraigned on a charge of heresy, based mainly upon some passages in his "Notes on the Epistle to the Romans." He was acquitted, but was recommended to change a few expressions which were thought liable to misconstruction; this was done, but the alteration involved no substantial variations of opinion from his earlier form of expression. When the Presbyterian church was divided, he remained with the New School branch. The degree of D. D. was repeatedly conferred upon him, but was declined. Besides his work as pastor and commentator, Mr. Barnes took a firm though moderate part in the movement against slavery in America. He also wrote largely for periodicals, and published, besides the works mentioned, an excellent introductory essay to "Butler's Analogy," "Scriptural Views of Slavery," "The Way of Salvation," "The Atonement," "Claims of Episcopacy," "Church Manual," "Lectures on the Evidences of Christianity in the Nineteenth Century," "Prayers for Family Worship," his "Defence" when on trial upon charge of heresy, several volumes of sermons, and a series of Sunday school question books.

BARNES, Thomas, an English journalist, born about 1785, died May 7, 1841. He was educated at Christ's hospital, London (where Leigh Hunt was his contemporary), and at Pembroke college, Cambridge, and after having published some powerful political letters in the "Times" newspaper, he succeeded Dr. (afterward Sir John) Stoddart in the editorship, which position he continued to occupy for nearly 25 years, finally becoming one of the proprietors. Among the best leaders from his pen was that on the character of George IV., which accompanied the obituary notice of that monarch, and a severe analysis of the character of Lord Brougham, suggested by the premature announcement of his death in 1839.

BARNES, William, an English poet and philologist, born in Dorsetshire in 1810. His family were farmers, his means of education were limited, and his philological learning was the result of study late in life. He was for a while a teacher in Dorsetshire, became curate of Whitcombe in 1847, and rector of Winterbourn Came in 1862. He is the author of "Poems in the Dorset Dialect" (1864) and "Poems of Rural Life" (1868). Among his philological and scientific works are: a "Grammar of the Dorset Dialect;" a "Philological Grammar," grounded upon English and formed from a comparison of more than 60 languages; "Tiev, or a View of the Roots and Stems of the English as a Teutonic Tongue;" "An Anglo-Saxon Dialect;" "Views of Labor and

Gold;" and a treatise on linear perspective and the projection of shadows.

BARNEVELDT, Jan Van Olden, grand pensionary of Holland, born at Amersfoort, Sept. 14, 1647, beheaded at the Hague, May 18, 1618. After studying law and divinity five years he began to practise law at the Hague in 1660, and soon became known as an able lawyer. He served in the army against the Spaniards, and was present at the siege of Haarlem in 1573. In 1585, after the death of William of Orange, he headed a deputation which offered the sovereignty of the Dutch provinces to Queen Elizabeth. The queen refused the offer, but sent a force under the earl of Leicester to their assistance. Barneveldt was soon afterward appointed advocate general or grand pensionary of Holland and West Friesland, and became leader of the republican party which favored subordinating the stadtholder to the legislature. He opposed the influence which the earl of Leicester was gaining, and in order to limit his military power had the dignity of stadtholder conferred on the young Prince Maurice, son of William of Orange. In 1603 he was one of an embassy to James I. and succeeded in obtaining the secret aid of England and France against Spain. In the religious strife between the Gomarists and Arminians, which began in 1604 and soon included all the clergy and laity of Holland, Barneveldt, who with most of the eminent scholars and statesmen of the country favored the more liberal views of the Arminians, endeavored to reconcile the two factions, now upon the point of war, by a conference of ecclesiastics, which resulted in a declaration of general toleration on the disputed points. In this the states concurred, and in 1614 an edict was issued enjoining peace. But Maurice, now Barneveldt's great rival, being at the head of the military party which had favored a prosecution of the war with Spain, while Barneveldt had in 1609 concluded a truce of 12 years, procured the summoning of the council of Dort, Nov. 12, 1618, which condemned entirely the Arminian doctrines. Barneveldt and his friend Grotius had already been arrested at the instigation of Maurice in the beginning of that year. His trial soon followed the decision of the synod, and was a mere farce, it having been already determined that he should die. He was found guilty, among other things, of "having brought the church of God into trouble," and was beheaded. As grand pensionary, which office he held until the year before his death, he conducted through peace and war the affairs of the commonwealth with great ability; and in the conflicts of religious factions he advocated the most enlightened measures of toleration and freedom. His two sons formed a plot to avenge his death by assassinating Maurice. The conspiracy being detected, one of them escaped, while the other was seized and executed.

BARNEY, Joshua, an American naval officer, born in Baltimore, July 6, 1759, died in Pitts-

burgh, Penn., Dec. 1, 1818. When the war of the revolution began he was appointed master's mate in the sloop of war Hornet, and in 1776, when scarce 17 years of age, was made lieutenant for his gallant conduct in the schooner Wasp, which captured the British brig Tender in Delaware bay. Soon after this he embarked in the Sachem, and was placed on board a captured vessel as prize master, but was captured by the Perseus of 20 guns, and exchanged. In 1777 he joined the Virginia frigate, which was taken by the British, having run aground in getting to sea. He was again exchanged, and joined a privateer which sailed in November, 1778, for France, and on her return took a valuable prize, arriving at Philadelphia in 1779. He subsequently sailed in the Saratoga, of 16 guns, Capt. Young, which fell in with the ship Charming Molly and two brigs, and took them. Barney headed the boarders thrown aboard the Molly, and was placed in one of the prizes, but on the following day all three were retaken by the Intrepid, 74. Barney remained a prisoner in England for some time, but at length escaped, and arrived in Philadelphia in March, 1782. He was appointed to the command of the Hyder Ali, a small vessel of 16 guns, and encountering off the capes of the Delaware the Gen. Monk, of 20 guns, took her after a hot fight of less than half an hour. For this the legislature of Pennsylvania presented him a sword, and he was appointed to the command of the Gen. Monk, and sailed for France in November, 1782. He returned to Philadelphia with a large sum of money lent by the French government, and the information that preliminaries of peace had been signed. In 1795 he was commissioned as captain in the French service, but gave up his command in 1800, and returned home. On the declaration of war against Great Britain in 1812, he was appointed by congress to the command of the flotilla which defended Chesapeake bay. He also took part in the battle of Bladensburg, and was severely wounded. A sword was voted to him by the corporation of Washington, and thanks by the legislature of Georgia. In 1818 he determined to emigrate to Kentucky, but on his way was taken ill and died.

BARNI, Jules Romain, a French author, born in Lille, June 1, 1818. He was for some time secretary of Victor Cousin, and since 1861 he has been professor of philosophy at the academy of Geneva. He translated the principal works of Kant into French, with critical comments and explanations (1836-'55); published several academic discourses under the title of *Les martyres de la libre pensée* (1862); and wrote *Histoire des idées morales et politiques en France au XVIII^e siècle* (2 vols., 1866).

BARNSELEY, a market town and municipal borough of Yorkshire, England, 12 m. N. of Sheffield, and 17 m. S. by E. of Leeds; pop. in 1871, 23,021. It has a spacious market place, extensive manufactures of linen, yarn, and drills, a glass factory, iron foundry, needle and

wire works, dyeing and coal works. Barnsley communicates with Wakefield and Leeds by the Barnsley canal, which connects the Calder and Don. Near it are the remains of Monk Briton priory.

BARNSTABLE. I. A S. E. county of Massachusetts, consisting of the peninsula of Cape Cod and several small islands, joining Plymouth county on the N. W., bounded E. and S. by the Atlantic ocean, and S. W. by Buzzard's bay, and including Cape Cod bay; area, 290 sq. m.; pop. in 1870, 82,774. The surface is generally low and level, and there are numerous clear sandy-bottomed ponds without outlet. The soil is light, and the lower portion of the cape sandy, and in great part covered with beach grass. Cranberries are extensively cultivated in the swamp lands. The forests are chiefly of pine. Seafaring is the principal occupation of the inhabitants. The county communicates with Boston and other cities by the Cape Cod railway and its branches. It has 4 or 5 banks, 5 weekly newspapers, 184 public schools, 2 woollen mills, 2 glass works, 8 tanneries, 1 saw mill, &c. In 1865 there were 28 vessels engaged in the whale fishery, 314 in the mackerel and cod fishery, and 818 in the coastwise or carrying trade. In 1870 the county produced 2,648 bushels of rye, 12,069 of corn, 4,019 of oats, 2,065 of barley, 11,246 of potatoes, and 3,872 tons of hay. II. A town, port of entry, and capital of the preceding county, situated on the S. side of Barnstable bay, on the Cape Cod railroad, 65 m. S. E. of Boston; pop. in 1870, 4,798. It has a bank, a savings institution, an insurance company, a weekly newspaper, and several churches and good schools. The inhabitants are mostly employed in fisheries or in coasting.

BARNSTAPLE, a parliamentary and municipal borough, seaport, market town, and parish of Devonshire, England, on the Taw, 6 m. from its mouth in Barnstaple or Bideford harbor, on the N. W. coast, and 84 m. N. W. of Exeter; pop. of the town in 1871, 11,250. It is believed to have been founded by King Athelstan. It is well built, has an ancient church, a grammar school, where Bishop Jewell and the poet Gay were taught, a mechanics' institute, tanneries, potteries, iron foundries, paper mills, and manufactories of woollen cloths, cotton lace, and nets. The streets are well paved and lighted with gas. The weekly market held here is the principal one of North Devon, and there is also a celebrated cattle fair in September.

BARNUM, Phineas Taylor, an American speculator, born at Bethel, Conn., July 5, 1810. His father was an innkeeper and country merchant, and from the age of 18 to 18 the son was in business in various parts of Connecticut, and also in Brooklyn, N. Y. Having accumulated a small sum of money, he returned to Bethel and opened a small store. Here he was very successful, especially after adding several lottery schemes to his other sources of income. After his marriage in 1829 he became editor of

the "Herald of Freedom," published in Danbury, Conn. In 1834 he removed to New York, his property having become much reduced. Here he tried many ways to obtain a livelihood, but without success till 1835, when, hearing of Joyce Heth, a colored woman then on exhibition in Philadelphia as the reputed nurse of George Washington, he bought her for \$1,000, and created some excitement by wide advertising, so that the receipts soon amounted to \$1,500 a week. He now collected a small company and travelled through the country, realizing large sums. In 1836 Joyce Heth died, and a post-mortem examination proved her to have been but 75 or 80 years old, instead of 161, which was her reputed age. From 1836 to 1839 Mr. Barnum continued in the show business, but then returned to New York, again reduced to poverty. In 1841, although without a dollar of his own, he purchased the establishment known as Scudder's American Museum, and in December took possession. At the end of a year he was able to pay for it, and in 1848 he had added to it two other extensive collections besides several minor ones. In 1842 Mr. Barnum first heard of Charles S. Stratton of Bridgeport, then five years old, less than two feet high, and weighing only 16 pounds, who soon became known to the world under Mr. Barnum's direction as Gen. Tom Thumb, and was exhibited in the United States and Europe with great success. In 1849 Mr. Barnum, after much negotiation, engaged Jenny Lind to sing in America for 150 nights, at \$1,000 a night. A concert company was formed to accompany her, and the gross receipts of the tour in 1850-'51 were over \$700,000, upon which Mr. Barnum made a large profit. In 1855, after having been connected with many enterprises besides those named, he built a villa at Bridgeport, retired from business, and published "The Life of P. T. Barnum, written by Himself." A full autobiography under the title of "Struggles and Triumphs" (8vo, Hartford), appeared in 1869. Unfortunate investments having made him a bankrupt in the latter part of 1857, he once more took charge of his old museum, and conducted it till 1865, when it was burned. Another which he opened was also burned. Since this event he has been interested in other enterprises in New York and in a travelling exhibition of animals and curiosities, and has retrieved his losses. He was an unsuccessful republican candidate for congress in Connecticut in 1868. Mr. Barnum has frequently appeared as a public lecturer on temperance and on the practical affairs of life, and has published, in addition to the above mentioned works, "The Humbugs of the World" (12mo, New York, 1865).

BARNWELL, a S. W. county of South Carolina, bounded on the N. E. by the Edisto river, and separated from Georgia on the S. W. by the Savannah; area, 1,550 sq. m.; pop. in 1870, 35,724, of whom 22,146 were colored. Its S. portion is watered by the Big and Little

Salkehatchie rivers. The surface is hilly, and the soil productive near the rivers. The chief productions in 1870 were 59,379 bushels of wheat, 781,054 of Indian corn, 70,106 of oats, 181,371 of peas and beans, 227,566 of sweet potatoes, 860,240 gallons of molasses, 24,910 bales of cotton, and 1,544,784 lbs. of rice. Capital, Barnwell Court House.

BAROCCIO, or *Barocci*, *Flori Federigo*, an Italian painter, born at Urbino in 1528, died there, Sept. 31, 1612. In his youth he studied the works of Titian, and in 1549 went to Rome to see those of Raphael. In 1560 he was intrusted by Pius IV. with the decoration of the Belvedere palace, and some of the Roman painters, envious of his genius, invited him to a banquet, where they gave him poison. For four years he was not able to touch his pencil, and afterward could only work two hours a day. His later pictures are in the style of Correggio. His "Last Supper," "Descent from the Cross," "St. Francis stigmatized," "Christ and Magdalen," and "Annunciation" are among his best productions.

BAROCEL. See **BROACH**.

BAROCHE, *Pierre Jules*, a French statesman, born in Paris, Nov. 18, 1802. He became a lawyer, and had acquired great celebrity as an advocate—particularly as the defender of Colombier, charged with complicity in the plot to assassinate the duke d'Aumale, and Joseph Henry, indicted for an attempt upon the life of Louis Philippe—when in 1847 he was elected by the town of Rochefort to the chamber of deputies. He attached himself to the opposition, and was one of those who signed the act of impeachment presented by Odilon Barrot against the Guizot cabinet, for prohibiting the reform banquet in the 12th arrondissement of Paris. Being elected a member of the constituent assembly, he was most emphatic in his declarations of fealty to the republic, but soon leaned toward the Bonapartists. Relected to the legislative assembly in May, 1849, he was made by Louis Napoleon home secretary March 15, 1850, and a few days later changed this post for that of secretary for foreign affairs. He favored the *coup d'état* of Dec. 2, 1851, and on the establishment of the empire was appointed vice president of the council of state. He was also one of the privy council nominated by imperial decree of Feb. 1, 1858, for the purpose of forming a council of regency in the contingency of the emperor's death. In 1860 he was for a short time minister of foreign affairs, and in 1863 he was appointed minister of justice and public worship, retaining that office till July, 1869. Among his most important acts in this capacity were the publication of a decree forbidding the bishops to promulgate the papal syllabus in 1865, and a circular recommending the public prosecutors to observe great moderation in enforcing the new press law. He was created a senator in 1864.

BARODA. I. A district in the province of Guzerat, British India, forming the territory

of a native prince called the Guicowar, and lying between lat. 21° and 23° N. and lon. 73° and 74° E.; area, 4,400 sq. m.; pop. about 350,000. For the physical characteristics of the district, see GUZERAT. Baroda has been under the rule of the family of the Guicowars since the early part of the 18th century, before which period its history is not recorded. In 1780 the East India company made a treaty of amity with the prince then reigning, Futteh Sing Guicowar, but kept up a merely formal intercourse with him and his successors till 1802, when, a rebellion taking place in the district, the ruling Guicowar applied to the governor of Bombay for aid. From this time till 1820 a series of similar appeals and of treaties brought Baroda gradually under the protection of the British, who also became answerable for certain debts of the Guicowar. In 1828, on

his failure to discharge these, the East India company sequestered a portion of his territory; but after some years the matter was arranged, and the district nominally restored to the native rule. A strong British force is however kept in the Guicowar's dominions, and Baroda is in fact, like the other native dependencies in India, a tributary state. II. The capital of the preceding district, in lat. $22^{\circ} 16'$ N., lon. $73^{\circ} 15'$ E., on the Biswamintri river, which is crossed near the city by the only bridge in the province, 231 m. N. of Bombay; pop. 140,000. The fortifications of the town, though ancient, are unimportant in a military point of view. The houses are generally of wood, and have several stories. The two principal streets run at right angles to one another, crossing at the market place in the centre of the city. The palace of the Guicowar, the house of the British resident,

A State Procession at Baroda.

and the market house are the principal buildings. Baroda was formerly a very important seat of trade, and of various industries; but since 1830 its prosperity has declined, and although it still carries on a considerable commerce with the country immediately about it, it has no noteworthy manufactures.

BAROMETER (Gr. *βάρος*, weight, and *μέτρον*, a measure), an instrument used for determining the pressure of the atmosphere. The doctrine of a *plenum* in natural philosophy, and the abhorrence of nature for a vacuum, had long been too fully established in the old systems to admit the possibility of a vacuum, when Galileo, toward the close of his life, was requested to explain why water could not be raised in a suction pump more than about 32 feet. He was led to admit that nature's abhorrence of a vacuum did not exceed the

pressure of a column of water 32 feet high; but subsequently, as mentioned in the last of his dialogues, he devised an experiment to ascertain the power of a vacuum. This consisted in applying weights to a piston closely fitting in a smooth tube, placed in an inverted position, to see what weight would draw it down; and previous to his death he recommended to his pupil Torricelli to continue these investigations. The decisive experiment, made by Torricelli, and called after him the Torricellian experiment, was in ascertaining the length of a column of mercury sustained by the same cause, whatever it might be, which supported the column of water. The weight of the mercury being about 14 times greater than that of the water, the height of the two columns, he reasoned, should be proportional to their weights. Filling a glass tube three

feet or more in length with mercury, and closing the open end with his finger, he introduced this by inverting the tube under the surface of mercury in a basin. On removing the finger, the mercury in the tube sank down, and after oscillating stood at about 28 inches above the surface of that in the vessel, leaving in the upper end a vacant space. (See fig. 1.) Torricelli continued his experiments, and discovered the fluctuations in the height of the column of mercury caused by the changes of the weather, and in 1645 an account of his observations was published; but he soon after died, before his great discovery was fully completed. The subject was taken up with great zeal by Pascal at Rouen in France. It occurred to him that if it were the atmospheric pressure which supported the column of mercury or water, the height of the column should be lessened as the pressure is reduced by ascending to greater elevations above the surface. He communicated his views to his brother-in-law Périer, who lived at Clermont in Auvergne, near the high conical mountain of Puy-de-Dôme, with the request that he should test the theory upon this elevation. This was not accomplished, however, till Sept. 19, 1648. Périer at this time, provided with mercury and tubes, observed in the garden of a monastery in the lowest part of Clermont the height at which the mercury stood in two tubes, which was 26 French inches and $3\frac{1}{4}$ lines. Leaving one of the barometers to be noticed in his absence, he took the other up the mountain, and at the summit found the height of the column was only 23 inches and 2 lines. At lower points, as he descended, the mercury rose in the tube, and at the base it occupied the same space in the tube as at first. This was the first observation ever made upon the different pressures of the atmosphere at different elevations. Périer repeated the experiment upon the highest tower of Clermont; and Pascal, on learning the result, made similar observations upon the top of a high house and the belfry of a church in Paris. Satisfied with the results, he soon proposed this process for determining differences of elevation. Attention began now to be directed to the variations in the height of the mercurial column caused by the atmospheric changes. Otto Guericke, an ingenious and wealthy burghmaster of Magdeburg, contrived a gigantic barometer for indicating the state of the weather. It was a glass tube nearly filled with water, 80 feet in length, placed within the wall of his house and rising above the roof, the lower end terminating in a cistern of water. In the upper part, which was of larger dimensions than the rest, was placed the figure of a man, large enough to be visible from the street. In fine weather this figure,

Fig. 1.

floating upon the surface of the water, appeared in full size above the roof; but as the fluid subsided with the change of weather, the manikin withdrew into the building.—From the original invention of the barometer to the present time, the ingenuity of the most distinguished men of science has been exercised in improving its construction. Numerous modifications of its form have been contrived, and yet those now most approved are but slightly varied from the straight inverted tube of Torricelli, and the siphon tube also proposed by him. The liquid selected by him is still preferred to all others by reason of the required weight of it occupying so little space. It is also not liable to be volatilized by slight elevations of temperature, and thus fill with its vapor the vacant space in the top of the tube. The simplest form of the instrument is that called the cistern barometer. The straight tube of Torricelli terminates at its foot in a cistern of mercury. By the rising and falling of the liquid in the tube, the level of that in the cistern must change. The absolute height of the mercury, therefore, is found by rendering the scale movable, and bringing its zero point always to the surface of the mercury in the cistern; or by making the scale fixed, and bringing the mercury to its zero point by means of a screw, which is made to press against a flexible bag that forms the lower part of the cylinder, as represented in fig. 2, where the details of the upper, middle, and lower part of the barometer are shown separately. The latter method is the most generally adopted in the best instruments. By means of a sliding vernier, the scale may be read to the $\frac{1}{10}$ th of an inch. Though various contrivances have been suggested for taking the place of these minute divisions and vernier readings, no substitute has yet been found to give such good results. By a skilful observer they can be read with great minuteness, and much within the limits of accuracy of the instrument in other respects.—The barometer adopted by the Smithsonian institution is that of Mr. James Greese of New York. A full description of this, with the drawings that are required to render it intelligible, is published in the 10th annual report of the institution. In the same article are also directions for the use of the instrument, and for making barometrical observations. The instrument is designed for service as a mountain barometer as well as for stationary uses. In fig. 8 is represented the tripod serving for its support during observations when used as a mountain or travelling barom-

Fig. 2.

eter. This stand folds up as seen in fig. 4, and serves then as an envelope to protect the instrument. Mr. Green constructed also, at the suggestion of Prof. Henry, a sulphuric acid barometer for the Smithsonian institution. As this liquid is much heavier than water, the tube was only about 18 ft. long; but experience proved it to be behind the mercurial barometer in its indications, and its use was abandoned.—The siphon barometer of Gay-Lussac, improved by Bunten of Paris, is a very portable and convenient form for the use of the scientific traveller. It is represented in fig. 5. The name siphon is applied to barometers of which the lower end of the tube is turned up to form a short arm, which constitutes the cistern, and may

be left open for the air to press directly upon the mercury. A capillary opening in this short arm, which is otherwise tight, answers the

Fig. 4.

same purpose as if the whole were open. The surface of the mercury in the lower arm corresponds to the zero point in the cistern barometer; and as this fluctuates as well as that of the longer limb, it is

Fig. 5.

necessary to use a vernier at each extremity of the column, and take two readings in order to determine the height of the column. As the two limbs are made of precisely the same diameter, the reading of one and doubling this gives a correct result. In Gay-Lussac's barometer, the tube at each extremity is of the usual diameter, but in the elbow, and along the lower part of the long limb, it is drawn down to a very small bore. The instrument is thus made to occupy very little space, so that the glass is enclosed in a brass cylinder of the size of an ordinary cane. An open slit at each end of the brass tube affords an opportunity of reading the verniers, the indexes of which traverse up and down these openings by means of toothed wheels

which run in a rack made upon the edge of the brass. The improvement introduced by Bunten is in dividing the long limb into two parts, the upper one of which is drawn down at its lower end to a small opening and inserted into the lower portion, to which it is attached, making again one tube. (See fig. 6.) The object of this conical projection of the upper into the lower part is to form a chamber or trap to catch any air which may be acci-

dentally introduced through the short branch, and thus intercept its passage to the vacuum, where by its elasticity it would counterbalance to some extent the pressure of the external air. When the barometer is inverted, the air lodged in the air trap escapes through the short branch by which it entered.—A barometer in common use is provided with an index which turns around upon a dial, and points to figures which indicate the height of the mercury, as also to words descriptive of the state of the weather, as "Cloudy," "Fair," "Rainy," &c. The index is made to move by means of a string, which passes around its axle, and has at each end a weight attached, the larger one resting upon the surface of the mercury in the shorter limb of a siphon barometer. (See fig. 7.) This is open to the objection that the reading of one limb gives but half the actual effect; but as the length of the index is several times greater than the radius of the pulley upon its axis, this objection is really more than counterbalanced. Still, little confidence is placed in its accuracy in marking the true variations of the column, there being so much friction that slight changes do not affect it at all. The words "Fair," "Variable," "Rain," "Storm," &c., found on the barometer scales, convey an erroneous impression about this instrument to the uninstructed; for the barometer does not designate by the absolute height of the mercury, but by its rising or falling, the kind of weather we may expect, and this change is not indicated by the index.—In filling a tube with mercury, particular care is required that the mercury be free from mixtures of other metals. It is introduced into the tube in small quantities at a time, and boiled as each portion is added, the heat being applied to that part of the tube containing the mercury last introduced. By boiling the mercury in the tube *in vacuo*, the air and moisture are most effectually expelled. On inverting the tube when properly filled, its lower end being kept in a basin of mercury, the column sinks to the proper level to counterbalance the atmospheric pressure. When the operation has been successfully completed, the column of mercury presents a bright undimmed appearance, and emits flashes of electrical light in the vacuum above, on the column being made to oscillate up and down in the dark; and a perfect vacuum is indicated by the clicking sound of the mer-

Fig. 6.

cury when it is allowed to strike the top of the glass tube. Still the electrical light is supposed to be dependent on a small quantity of vapor left behind in the vacant space of the tube; but in several instances it has been observed that the mercury remains suspended in the tube when this is inverted, even if the lower end be not placed in a cistern of the metal. It is detached by a sudden jar. The adherence of the mercury to the glass tends to introduce errors in estimating the true height of the column. Instead of forming at the top of the column a concave surface by the particles adhering to the glass and climbing up its surface, as water and other fluids do by the property called capillarity, the mercury takes a convex form, and the column is lower than it should be. The smaller the bore of the tube, the greater is this depression and the error involved; but in the siphon barometer (fig. 5) the error of one convex surface of the mercury in one limb is counteracted by the same effect from that of the other.—However well constructed and filled, all barometers are liable to vary, after years of use, by a partial oxidation of the mercury, producing a thin film, which attaches itself to and obscures the inner surface of the tube. This film can be removed only by cleaning and refilling with fresh mercury. Air is liable to creep in between the mercury and the glass, and gradually enter into the vacuum, producing in the best instruments effects that are only perceived after a series of years; instruments used for a long period show a less height in the latter than in the former part of the period.—Prof. Daniell constructed the most perfect water barometer ever made, which is somewhat similar to that already noticed of Guericke at Magdeburg. It is fixed in the hall of the royal society at Somerset house. The tube is of glass, 40 ft. long and an inch in diameter. The water in it stands at an average height of 400 inches above the fluid in the cistern. A layer of a solution of caoutchouc in naphtha upon the water in the cistern prevents access of any air to the tube. The column is sensitive to continual changes of pressure in the atmosphere, which do not affect other barometers. In windy weather it is in perpetual motion, vibrating up and down almost with the regularity of respiration. It indicates the horary oscillations of the pressure sooner than does the mercurial barometer of half an inch bore.—In the use of barometers, it is often desirable to have their variations recorded without the necessity of frequently observing them. Several methods have been devised of rendering them self-registering. One method is that of Mr. Bryson of Edinburgh. Upon the mercury in the lower limb of a siphon barometer is placed an ivory float, which carries outside to the tube a knife edge. This, by proper machinery, is made to touch once every hour the surface of a vertical cylinder, which revolves with uniform motion once in 24 hours, and upon the face of which

are marked spaces corresponding to the hours of the day and night. A new cylinder is used each day. The marks are made upon a coating of fine chalk and water laid on with a camel's-hair brush. Such arrangements are, however, far inferior to the photographic method now adopted in all meteorological observatories. This consists simply in a slip of sensitive photographic paper, moving by clockwork behind the upper part of the mercurial column, which throws its shadow on it, and thus prevents the impression of the light on the lower shaded portion. The light used is a kerosene lamp, and the slips of paper, after having been exposed, are darkened upon their upper half, while the undulating line between the darkened and light portion shows the variations of the barometer during the time of exposure. Account should be taken of the temperature at the same time that the observations of the barometer are noted; for the height of the column, as in the thermometer, must vary with change of temperature, as well as by change of atmospheric pressure. It is particularly important to make allowance for this cause of variation in observations for determining elevations, and a thermometer is always attached to the barometer for this use. Between the points of boiling and freezing it is found that the space occupied by mercury amounts to $\frac{1}{11}$ of its bulk. For each degree of heat by the centesimal scale its volume increases $\frac{1}{1100}$; by Fahrenheit's thermometer, $\frac{1}{1717}$. Though little reliance can be placed upon the barometer as indicating by any single observation the condition of the weather, its fluctuations caused by changes of atmospheric pressure may, when carefully noticed, often serve to foretell the effects that must still ensue. Thus, a sudden and long-continued fall is a sure sign of an impending storm. Many instances are recorded of vessels being saved by the precautions taken, in consequence of the warning of the barometer at the immediate approach of hurricanes, of which no other notice was given.—Barometers have been constructed with particular reference to use at sea. (See fig. 8.) Their tube has a bore scarcely exceeding $\frac{1}{4}$ of an inch. Its upper end terminates in a cylinder 4 or 5 inches high and nearly $\frac{3}{8}$ of an inch in diameter. It is suspended by a spring and gimbals near the top. The object of the larger bore above the capillary tube is to prevent a rapid flow of the mercury, which might be caused by the motion of the ship, and break the tube by its striking against the top. The form is liable to the objection that the rise and fall of the fluid is

necessarily very slow, and several minutes may elapse before a sudden change of atmospheric pressure is indicated.—The cause of the shifting pressure of the atmosphere is to be looked for in the operations of the winds which may be blowing in distant localities. By drawing the air away from any point, the pressure is here to some extent taken off, producing a partial vacuum which must soon be filled by a rush of air from other sources. Where the winds are equable, like the trade winds of the tropics, the movements of the barometer partake of the same regularity. Humboldt, in his researches in the equatorial regions of South America, was greatly struck by the uniformity of the motion of the barometer in the different periods of the day. From 4 o'clock in the morning till 10 the mercury generally rises, and then falls until 4 in the afternoon. It then rises again till 10 at night, after which it falls till 4 in the morning. In temperate northern latitudes the barometer generally stands higher at 9 A. M. and 9 P. M. and lower at 8 A. M. and 8 P. M. than at other hours. Prof. Daniell recommends these hours as the best times for consulting the barometer as a weather glass. Its rise between 9 A. M. and 8 P. M. indicates fine weather. A fall from this time to 9 P. M. is likely to be followed by rain. Prof. Buys Ballot of Utrecht occupied himself for many years in making with others simultaneous observations in different localities of the changes in the barometer and in wind and weather. He determined positive numerical relations between the force of the wind and the height of the barometer preceding it. He succeeded at last in finding the laws governing the forward motion of the centre of barometric depression, followed by storms, and induced the government of Holland to establish a weather bureau with public storm signals in 1860, which was followed by England in 1861, by France in 1863, and by the United States in 1870. These laws, as might be expected, differ in different localities. From this relation rules have been deduced by which the maximum force of the wind during the day may be predicted every morning, thus enabling outward-bound vessels to determine the safety of putting to sea.—The BOILING POINT BAROMETER is an instrument whose action depends upon the variable temperature at which water boils at different elevations, or, what is the same thing, under different atmospheric pressures. It is constructed with a small cistern for the water, arranged in a cylindrical tin tube, which contains in the lower part an alcohol lamp for heating the fluid. The temperature is best noticed by suspending the bulb of the thermometer in the partially confined steam which rises from the boiling water. The difference in the temperature observed at two different points, expressed in degrees of Fahrenheit's thermometer, being multiplied by 580, will give the approximate difference of elevation between these two points. For greater accuracy correction should be made for the

difference of the temperature of the air at the two places. Although the instrument is in a very portable and convenient form, it has not proved a favorite with scientific observers, from a want of confidence in its results.—The ANEROID BAROMETER (Gr. *ἀνέρος*, and *είδος*, a form

without fluid) is a modification of the vacuum case barometer, the earliest form of which was invented by M. Conté, professor in the aërostatic school at Meudon, near Paris, and described by him in the *Bulletin des sciences*, Floreal, year 6 (1798), p. 106. M. Conté in his balloon ascents found the reading of the mercurial barometer subject to the same difficulties so much complained of on shipboard, arising from the violent oscillations of the instrument. He therefore invented a watch-like, metallic, air-tight vacuum case, the lid of which, sustained by internal springs, rose and fell under the variable pressure of the atmosphere, an index showing the motion. M. Vidi subsequently devised a case of different form, with a flat corrugated top and bottom, flanged over and soldered to a rim, first pressed together at the centre by the withdrawal of the enclosed air, and then separated a certain distance by the introduction of a compensating spring. The instrument thus improved and constructed has come into extensive use. It is represented externally by fig. 9; fig. 10 shows the interior

Fig. 10.

arrangement, while fig. 11 shows a cross section of the flexible air-tight box, which collapses when the air is withdrawn. (See fig. 12.) By means of a spring it is brought back

to its original position, the spring pulling it out again, and thus counterbalancing the atmospheric pressure, which tends to make the

Fig. 11.

Fig. 12.

box collapse. A change in this pressure will of course resist the spring more or less, and this slight motion, multiplied by a proper mechanical arrangement, turns the hand seen at the top of fig. 10, and also, with the scale, in fig. 9. As, however, a rise in temperature expands the spring and diminishes its resistance, it will have the same result as an increased atmospheric pressure, namely, tend to let the box collapse. Becker, a well-known balance maker of New York, corrects this by introducing into the vacuum in the box a measured but very small quantity of perfectly dry air, the expansion of which by heat counterbalances the loss of tension of the spring by the same cause. Experience proves, however, that this kind of compensation becomes inert after a lapse of a few years; hence a correction for temperature is required, the instrument having a thermometer attached, as shown in fig. 9. Unfortunately, this correction must be found by experiment for every instrument, and changes even for the same instrument in the course of time. The coast survey and the Smithsonian institution have therefore pronounced against these barometers. Their objections, however, it is thought, do not apply to their use in the hands of practical surveyors, topographers, civil engineers, artists, travellers, and sailors, who all pronounce emphatically in their favor. The observer must however learn to know his instrument well, or he can do nothing with it on an extended survey. Of course the aneroid can be of no service in the high geodesy of a coast or ordnance survey. In civil engineering, on the contrary, up to the final location line, it is reasonable to expect that it will almost replace the spirit level. In geological examinations it is invaluable. The geologist in tracing outcrops through the woods and where the rocks are entirely concealed, across ravines, and over the shoulders of hills, in a broken country, has only to discover and take the direction of the line of strike, to know by the infallible rise or fall of the index hand to the level of the point of his departure precisely when he is passing up or down over the outcrop of his bed. In countries where the rocks are nearly or quite horizontal, in fact over half the United States, the aneroid is to the geologist a whole corps of assistants, and the work of a week can with its help often be done in a day. There is an external index to assist the memory of the house observer from one observation to another.

BAROMETRICAL MEASUREMENT. By the perfection now attained in the construction of barometers, and the skill applied to their use by the best observers, differences of elevation may be ascertained by them with greater accuracy than by the most carefully conducted triangulation—at least, in places where the elevations are great and difficult of access. High summits, covered with shifting clouds, involve uncertain errors, arising from constantly varying refraction; and inaccessible mountains can only be observed under very small angles from the termini of a carefully constructed base line, in some smooth district, at a considerable distance from them. A comparison of results obtained by both methods is generally in favor of the barometer. Humboldt noticed this, particularly in the numerous measurements that had been made of the peak of Teneriffe, and, in determining this elevation by the mean results of the various observations, he rejected eight out of nine geometrical measurements, and only one out of four barometrical measurements. Both modes, however, are capable in many localities of a great degree of accuracy, as is shown in the two measurements of Mt. Washington, the first by Prof. Guyot with the barometer, and the second by the officers of the coast survey, in which the difference was only 8 ft. in the height of 6,285 ft. determined by Prof. Guyot. To insure the greatest degree of accuracy, it is essential to use two good barometers, one at the lower and the other at the upper point. If only one be employed, there is a liability of error from a change of atmospheric pressure taking place during the time spent in passing from one station to the other. These barometers should have been carefully compared by many observations, and the mean of their variation noted, to be always allowed in the calculation. They should also have been compared with other barometers of known character, and their differences with these noted, and this comparison should be repeated after their use, in the same way as chronometers are compared, and their rates noted, before and after a voyage. Repeated observations should also be made at both stations at the same times, and the mean of all be taken, unless some show good reasons for their rejection. It is also important that the two stations be not very far apart. In a distance of 40 or 50 m. there may well be varying conditions of the atmosphere that cause a difference of pressure not due altogether to the difference of elevation. This cause of error may be avoided by using intermediate stations, and advancing step by step.—One point determined serves as the established base for determining the next beyond. In measuring the heights of the principal summits of the Black mountains of North Carolina, Prof. Guyot used as his starting point the level determined by a railroad survey, 7 m. distant from the nearest hill. The next station was taken half way to the summit, and by repeated observations at both, continued dur-

ing two days, the liability to error resulting from too great distance was avoided; so also was that from a faulty correction for temperature. This correction, as applied by the tables, amounts sometimes to 800 ft. But it supposes the actual temperature of the stratum of air between the two points to be represented by the mean of the temperature at the two places, and a moderate variation from this may well involve an error of $\frac{1}{4}$ or $\frac{1}{5}$ of the whole correction. Such a variation is not at all improbable where the difference of elevation is very great, as in the higher regions the decrease of temperature takes place more and more rapidly. The next station was the summit of the first hill, the height of which was ascertained by comparative observations made upon it and at the same time at the second station. The different peaks were then compared one with another by observations made upon them in pairs. So exactly were these measurements conducted by Prof. Guyot, that, as he states, his single observations differed only two or three metres from the means, and the mean of one day scarcely differed one metre (39 inches) from the mean of another. But for these precautions an error might have resulted in the determination of the first summit of 50 ft. or more, such as Prof. Guyot found he was liable to in the course of his observations at the White mountains when the two stations were from 10 to 20 m. apart. As the distance between stations increases, the number of observations should also be multiplied, in order to obtain a correct mean. The barometers are to be carefully suspended, so that the column shall be perfectly vertical, and they should be placed in a situation not subject to sudden change of temperature. The reading of the height of the mercurial column is to be taken at the same time as that of the thermometer attached to the barometer, and also of the detached thermometer. If the instrument has been suspended for some moments, the two temperatures may not differ. When these observations are compared with those made at the same time at the other station, the calculations for the difference of elevation are usually made by the aid of the tables prepared by M. Oltmanns. This is a much more simple process than calculating the difference by the theorem of Laplace, which gives the same result. If the instruments are graduated in inches, these must be turned into metres, and the temperatures must also be expressed in degrees of the centigrade thermometer. With the tables for these conversions and calculations are given very simple directions for their use, and applying the necessary corrections.—Some singular barometric anomalies are reported by Lieut. Herndon to have been observed by him in the vicinity of the Andes. At the eastern base he found the pressure, as measured by the boiling point of water, to be nearly as great as at the level of the sea. Having descended nearly 1,000 m. on the Amazon, the boiling point indicated an as-

cent of nearly 1,500 ft. Maury explains this by referring it to the effect of the trade winds, which strike upon the flanks of the mountains and are banked up against them, as a current of water interrupted by impediments in the channel is piled against these. By the banking of the current of air an increased pressure is supposed to be exerted upon the surface at their base.—In the earlier measurements made with the barometer the air was considered as a uniform fluid, no regard being paid to the gradual diminution of density in ascending into the higher regions; but when this gradation was taken into the calculations, it became necessary to determine the relation between the density of the air and its elastic force. Mariotte, who published his "Discourse on the Nature of Air" in 1676, and who was the first to demonstrate the law which bears his name, that the volume of a gas is in the inverse proportion to the pressure upon it, opened the culture of a new field from which rich harvests were subsequently reaped. From the suggestions afforded by this simple law he proposed to compute heights from barometrical observations by the rule usually employed in constructing tables of logarithms, seeming to have obtained some idea of the remarkable fact that the density of the atmosphere decreases in a geometrical progression corresponding to the elevations taken after an arithmetical one. But for some reason he seemed not to be aware of the importance of the great principle, and abandoned the method for another in which he repeated the bisection of a column of air between two stations into successive horizontal strata, calculating the densities according to a harmonic division.

BARON (Gallic *ber*, Gothic *cair*, mediæval Latin *baro*, early Spanish *varon*, a man), in the middle ages, the possessor of an estate, who might have feudal tenants under him. In France the nobles in general were at first called barons, but subsequently the immediate vassals of the king received the appellation of *hauts barons*, or high barons. In Germany the early barons were the highest nobility, who afterward assumed the titles of counts and princes. In more modern times, in both France and Germany, a baron (in the latter country now generally called *Freiherr*), is a nobleman next in rank to a count. In England the original barons of the realm were those who held lands by tenure of suit and service to the king. They were bound to attend the king in war, to supply money on particular occasions, to furnish a military contingent proportioned to the extent of their fiefs, and to attend the king's courts. Various circumstances having increased the numbers of the barons holding direct from the sovereign, a practice became established about the time of Edward I. of summoning individuals by writ to the great councils. The barony by tenure and by writ being heritable, the inheritance of the titles became complicated by the devolution of the estates to female descendants,

who, though incapable of holding titles, were nevertheless capable of transmitting them. From this a practice arose of creating barons by patent, limiting the succession to heirs male. All noblemen were originally the king's barons, and *inter pares* the question of precedence was one not always easy of settlement. The creation of dignities superior to those of barons—dukes, marquises, earls, and viscounts—to which some of the greater barons were raised, settled the question in part, and the antiquity of the particular title determined the precedence among those of equal dignity. Some other persons in England, as for instance the citizens of York and London, were styled barons, whose titles were drawn perhaps from the relation of suit and service in which they stood to the crown. The judges of the court of exchequer, a court instituted immediately after the conquest, are still styled barons.

BARON AND FEME, the Norman-French term used to signify man and wife in the early English law writers. (See **HUSBAND AND WIFE**.)

BARONET, an English title of honor. The baronet is the next degree in point of precedence below a baron. The baron is a peer of the realm, a hereditary legislator; the baronet is a commoner. The dignity dates from James I., and according to Blackstone was instituted by that monarch in order to raise a competent sum for the reduction of the province of Ulster in Ireland, for which reason all baronets have the arms of Ulster superadded to their family coat. The candidates for the honor were required to be of gentle blood, and of adequate means to support the dignity; and it was promised that the number should not exceed 200, and that lapses by death should not be filled up. This promise, however, was soon abandoned. For similar reasons an order of baronets of Nova Scotia was created by Charles I. (See **ALEXANDER, WILLIAM**.)

BARONIUS, or *Baronio, Cesare*, an Italian historian, born at Sora in 1588, died in Rome in 1607. He went to Rome in 1557, and became one of the first disciples of St. Philip of Neri, founder of the congregation of the Oratory, whom he succeeded as superior in 1593. Pope Clement VIII. soon after made him his confessor, in 1596 created him cardinal, and finally appointed him librarian of the Vatican. He was twice a candidate for the papal chair, but was defeated by the Spanish party, to which he had given offence in his treatise *De Monarchia Sicilia*, by opposing the claim of Spain to Sicily. His principal work, a history of the church, entitled *Annales Ecclesiastici a Christo nato ad annum 1198* (12 vols., Rome, 1588-1607), written to oppose the "Magdeburg Centuries," occupied him for 30 years. It abounds in errors of various kinds, and shows a lack of critical spirit; but it is esteemed one of the most valuable repositories of church history, and a work of great learning and research. It was continued by Rinaldi and Laderchi, and annotated by Pagi;

and the whole work, with the continuations, &c., was republished at Lucca in 38 vols. fol., 1737-'57. A more recent continuation, embracing the years 1573-'85, was composed by Theiner (Rome, 1856-'57). Baronius also published an edition of the *Martyrologium Romanum*, with notes (fol., Rome, 1586), but afterward endeavored to suppress it on account of errors discovered in it.

BARONY, in England, the manorial right or lordship of a baron, for which the courts baron were formerly held. In Ireland the term designates a particular territorial division existing from very ancient times, and corresponding nearly to the English hundred.

BAROTSE, a valley in the interior of S. Africa, inhabited by a tribe of the same name, lying between lat. 15° 20' and 16° 30' S. and lon. 23° and 24° E. It is traversed by the Zambesi river below its confluence with the Leba, and is subject to annual inundations by that river, like the valley of the Nile, to which it bears a close resemblance. The villages are built on mounds, some of which are said to be artificial, and during the inundation the country assumes the appearance of a large lake, with the villages on the mounds like islands, as in Egypt. Barotse is supposed to have once been a lake, and there is a slight tradition of the waters having burst through the low hills on the south. The soil is very fertile, and the natives are able to raise two crops a year; but there are comparatively few trees. Dr. Livingstone thought that the Barotse valley was too rich to raise wheat, and would make the corn run to straw; one species of grass was observed 12 feet high with a stem as thick as a man's thumb. The land is little cultivated, and mostly covered with coarse succulent grasses which afford ample pasturage for large herds of cattle. On the waters retiring subsequent to the inundation the gases arising from the masses of decaying vegetation are the cause of fevers from which the natives suffer severely. Other diseases are almost unknown except smallpox, which sometimes rages there. The natives, however, appear to be acquainted with inoculation. The river abounds with voracious alligators. The Barotse pray to these animals, and eat them too. They reverence the sun, and believe in a future spiritual existence. The capital of the country is Narile, with 1,000 inhabitants.

BAROZZIO DA VIGNOLA. See **VIGNOLA**.

BARQUISIMETO. I. A N. W. state of Venezuela, touching the Caribbean sea on the N. E.; area, 9,850 sq. m.; pop. about 314,000. The surface consists of fertile valleys, densely covered desert mountains, arid hills and barren plains, all of which afford, however, good pasturage for goats, which are reared in numbers, also for horses, mules, and asses. Cattle raising and agriculture are the chief occupations. The largest rivers are the Portuguesa, Tocuyo, and Yaracuy. The state is the most prosperous of Venezuela, and is divided into

six cantons. **H.** A city, capital of the state, on a river of the same name, 70 m. from the sea, and 155 m. W. S. W. of Caracas; pop. about 11,000. It was founded in 1552 by Juan de Villegas, who first called it Nueva Segovia. It is situated 1,719 feet above the level of the sea. A terrible earthquake in 1812 scarcely left a house standing; but the city has since been handsomely rebuilt. It is conveniently situated for commerce, as several important roads from the west converge here. There are a college, seminary, and numerous other schools. Excellent coffee and fine cacao are produced in abundance. The city was frequently occupied by the belligerents during the war of independence, and the scene of much bloodshed.

BARR, a town of Germany, in Alsace, at the foot of the Vosges mountains, and at the entrance into the picturesque Ulric valley, 18 m. S. W. of Strasburg; pop. in 1871, 5,651. It has manufactories of soap and of woollen, cotton, china, pottery, and crystal ware; it also has a brisk trade in wine, iron, wood, and cattle. The place is mentioned in the 8th century. In 1592 it was totally destroyed by the troops of the cardinal of Lorraine. Above the town rises Mount Odilia (2,521 ft.), on which St. Odilia, the daughter of Duke Attic of Alsace, established a celebrated monastery, which was sold during the French revolution.

BARR, or Barra, a small kingdom of W. Africa, near the mouth of the Gambia, extending along the N. bank of the river about 50 m.; pop. estimated at 200,000. This kingdom was founded by a Mandingo warrior from the interior, who overran the country, and afterward kept his hold of it by means of arms procured from Europeans in exchange for slaves. The free Mandingoes constitute only a quarter of the population, and are described as a well made, industrious, and shrewd race, all zealous Mohammedans. The remainder of the population are in slavery.

BARRA (or **BARRAY**) **ISLANDS**, a group of about 20 islands, forming a parish of the same name, on the W. coast of Scotland, belonging to the chain known as the Outer Hebrides. The principal island, from which the rest are named, is about 8 m. long, and from 2 to 4 m. wide; pop. about 1,600, chiefly Roman Catholics. It contains the ruins of several very old religious houses. At a place called Kilbar are the remains of two churches said to have been built by the monks of Icolmkill, and at various

points throughout the island stand ancient watch towers. Druidical circles are found in many places, and a dun or fort, supposed to have been built by the Scandinavians, is on every lake. In the middle of a beautiful bay, on a small rock entirely covered by the tide at high water, stands the ancient castle of the Mac Neils. On Barra is the highest lighthouse in Britain, 680 ft. above the sea.

BARRACKPOOR, a town and military cantonment of Bengal, on the E. bank of the Hoogly, about 10 m. N. N. E. of Calcutta. It is a favorite retreat for the Europeans of Calcutta, and contains the country residence of the governor general. The town itself is irregularly built, most of the houses being bungalows, embosomed among lofty trees, and the country around is profusely wooded. It possesses a park of 250 acres, with a fine collection of Indian zoölogy, and a stud of elephants, main-

Barrackpoor.

tained mainly for the recreation of the guests of the governor general. Barrackpoor is noted as the place in which the first blood was shed in the sepoy mutiny. The town was a convenient station for military operations in the eastern part of Bengal, and for any sudden emergency at Calcutta. Four native regiments, with European officers, were stationed there. Discontent had arisen among the men, who supposed that the new cartridges issued to them were greased with animal fat, and one regiment was disbanded in February, 1857. On March 29 an armed sepoy marched about, declaring that he would shoot the first European he met. He wounded a European lieutenant, and a native officer refused to arrest him. Both were afterward arrested, tried by court-martial, and executed April 5; and a few days later the regiment to which they belonged was disbanded. After the suppression of the mutiny extensive barracks were erected here for British troops.

BARRAL, Jean Augustin, a French chemist and physician, born at Metz in 1819. After receiving his education at the polytechnic school, he became an officer of the *régie* or government tobacco monopoly. He was the first to extract nicotine from the leaf of that plant, and to demonstrate by experiment its poisonous qualities. In 1845 he was made a tutor of chemistry at the polytechnic school, and in 1851 a professor of chemistry and natural philosophy at the college of Sainte-Barbe. In 1850 he made two ascents in a balloon, which were attended with great danger, for the purpose of taking observations on the temperature, humidity, and other conditions of the atmosphere at various heights. He edited for a while the *Journal d'agriculture pratique*, and has written many treatises on the application of chemistry to agriculture, metallurgy, and the arts.

BARRAS, Paul François Jean Nicolas, count de, a French revolutionist, born at Fox-Amphoux, Provence, June 30, 1755, died at Chaillot, near Paris, Jan. 29, 1829. He served in the East Indies, in the army, returned to France with the rank of captain, wasted his fortune, and, though he had no political opinions, threw himself among the revolutionists, probably in the hope of retrieving his affairs. He took part in the attacks on the Bastille and the Tuileries, and was elected by the department of Var a member of the convention, where he voted for the death of the king, with neither delay nor appeal to the people. In October, 1793, being sent to the south of France with Fréron, he succeeded in forcing the anti-revolutionists to submission. He went alone to arrest Gen. Brunet, who was charged with having traitorously delivered Toulon into the hands of the English. Returning to that city, he hurried the siege; and when Toulon was taken, he visited the traitors with the most severe punishment. He was one of the most active in the revolution of the 9th Thermidor, and headed the troops who took Robespierre in the hôtel de ville. Next day, having resigned his command, he was appointed secretary to the convention, and in November a member of the committee of general safety, when he proved himself at once an ardent persecutor of the montagnards and the emigrants. At the same time he proposed the celebration of the anniversary of the death of Louis XVI. On Feb. 4, 1795, he was elected president of the convention. On the 12th Germinal, when the mob presented themselves in arms, demanding "bread and the constitution of '93," he caused martial law to be proclaimed, and conducted himself with energy. On the 1st Prairial he again beat down the attack of the suburban people. On the 18th Vendémiaire he was intrusted with the command of the troops to protect the assembly, and selected as his assistant Gen. Bonaparte, whose vigorous measures very promptly quelled the royalist insurrection. Elected one of the five members of the directory, he used his office as

the means of gaining immense wealth and indulging his taste for debauchery. On the 18th Fructidor, 1798, he executed the *coup d'état*, which changed the complexion of the two councils, and banished the minority of the directory. In the internal revolution which occurred in the directory on the 80th Prairial, 1799, he succeeded in maintaining his position, and thenceforth reigned nearly paramount. A series of intrigues and plots then commenced, which ended only when the directory was overthrown by Bonaparte on the 18th Brumaire. (See DIRECTORY.) Suspected of corresponding with the royalists and strictly watched, he was compelled at last to fly to Brussels, where he lived in great luxury. After the establishment of the empire he was permitted to return to Marseilles. Convicted of participation in Mallet's conspiracy, he was exiled to Rome. He declined serving Murat in 1814, and started for France, but was arrested at Turin, and led to Montpellier, where he conspired openly in the interest of the Bourbons. After the restoration he lived near Paris in almost princely style. His memoirs were published in 1878.

BARRATRY (It. *barrateria*, fraud), in maritime law, fraudulent conduct by the master of a vessel, or by the mariners, to the injury of the owner of the ship or cargo, and without his consent. Gross negligence, or unauthorized acts of the master to the injury of the owner, are also held to constitute barratry. Under the first are included wilful acts, such as destroying or carrying off ship or cargo, or embezzling any part of the cargo; under the second, deviation from the usual course of the voyage by the master for his own private purposes, trading with an enemy, evading port duties, disregard of a blockade, and other acts exposing the vessel or cargo to seizure and confiscation. Barratry is one of the risks commonly insured against, and the underwriter is liable for loss by any of the acts above specified, with the limitations: 1, that the owner in order to recover must not have consented to the act of the master or crew, but the consent of the owner of the ship will not affect the right of the owner of the cargo; so also if the vessel has been chartered, the charterer is *pro hac vice* the owner, and will not be affected by the connivance of the real owner. 2. The underwriter is liable for the acts of mariners only so far as they could not be prevented by ordinary care on the part of the master. Barratry by the wilful burning, casting away, or otherwise destroying a vessel on the high seas, is a highly penal offence in Great Britain, and in this country if done by a person belonging to the vessel not being an owner, as also if done by an owner with intent to defraud an underwriter, shipper, or other part owner. (See BARRETRY.)

BARRE, Antoine Joseph le Fèvre de la, a French naval officer, died May 4, 1688. He was appointed governor of Guiana in 1663, and retok

Cayenne from the Dutch. In 1667 he was created lieutenant general, and defeated the English in the Antilles, forcing them to raise the blockade of St. Christopher. In 1682 he was appointed governor of Canada, taking the place of the count de Frontenac. He was, however, recalled about 1684, for having by his irresolution caused the failure of the expedition to treat with the savages. He published a work on Guiana, entitled *Description de la France équinoxiale* (1666), and *Journal d'un voyage à Cayenne*.

BARRÉ, Isaac, a British soldier and statesman, born in Dublin in 1726, died July 1, 1802. He received his education at Dublin university and afterward studied law in London, but entered the army, was ordered to Canada, and became an intimate friend of Gen. Wolfe, who obtained his promotion at various times, until he reached the rank of lieutenant colonel. He was severely wounded at the capture of Quebec, and was with Wolfe when that general died. He occupies a prominent position in Benjamin West's painting of "The Death of Wolfe." After the surrender of Montreal, Sept. 8, 1760, he was appointed bearer of despatches from Gen. Amherst to Lord Chatham. In 1761, by the influence of the earl of Shelburne, Col. Barré was elected member of parliament for the borough of Chipping Wycombe. Almost his first political act was to make a personal attack upon the earl of Chatham. He has been accused of personal motives in this action, as he had considered Chatham an obstacle in the way of his promotion while in the army. This attack was as bold as it was unexpected, and at once raised Barré to a prominent position among the supporters of the ministry, Chatham leading the opposition. In 1768, after the disbanding of Barré's regiment, he received the appointment of adjutant general to the British forces and governor of Stirling castle, his patron, Lord Shelburne, becoming president of the board of trade; but in December of the same year he was removed from his appointments, having joined the opposition and voted against the government on several occasions. In 1765 he opposed the stamp act, and made a forcible appeal to the house in favor of the colonies. In 1766, under the second administration of Lord Chatham, Col. Barré was appointed one of the vice treasurers to Ireland and was sworn of the privy council. In the discussion upon the question of reporting the parliamentary debates Col. Barré opposed the ministry, and after a full exposure of the corruption then existing, and the strongest denunciation of the corrupt members, he left the house, calling upon every honest man to follow him. Throughout the administration of Lord North Col. Barré continued the warm friend of the American colonies, and distinguished himself greatly by the boldness with which he advanced his sentiments. On the dissolution of the North ministry, Lord Shelburne became secretary of state for foreign affairs, and Col. Barré treas-

urer of the navy. Afterward, upon Shelburne becoming premier, Barré received the post of paymaster of the forces, which he held but a short time, as he retired with his patron in 1783, receiving for his services a pension of £3,200 per annum, which was afterward exchanged for the sinecure of clerk of the pells, with £3,000 per annum. Col. Barré continued in parliament till 1790, when he retired, owing to the loss of his sight consequent on a wound received at Quebec. He has been supposed by many to be the author of the Junius letters.

BARRÈGES. See **BARÈGES**.

BARREL, a hollow vessel made of staves, set on end, arranged around a circle, and bound together with hoops. By each stave being made wider in the middle and tapering a little toward the ends, the barrel is of larger diameter, or bulges, in the middle. The bevelled edges of the staves cause them to fit closely together, making a tight joint along their length. The ends are closed by circular heads, the edges of which are made thin to fit into a groove cut to receive them near the ends of the staves, in which they are held fast by driving the hoops upon the swell of the barrel. The construction of the barrel is most ingeniously adapted for combining great strength with lightness. It resists pressure from without by the arched arrangement of the staves; and the hoops secure it from the expansive force of gases often generated in its contents. Its form is the most convenient for transportation, admitting of the vessel being rolled or rapidly swung by hooks placed under the chine or ends of the staves. It is not strange, therefore, that many millions of them should be annually made for the numerous uses they serve. In the form of kegs, firkins, liquor casks, butts, hogsheads, &c., they are met with everywhere. Yet the Chinese, with all their ingenuity, it is said, have never made a barrel.—Until recently barrels have been constructed entirely by hand, the cooper shaving the staves with the draw knife, and shaping them by clamps. But machines are now applied to this purpose, by which the work is done much more expeditiously. The staves are planed, steamed, and then passed between a series of rollers, which compress and bend them into proper shape. A stave is next set up on end in a frame, which holds it securely and forces it to its right bend, and swinging around to a plane working vertically on one side, one edge is jointed to its right bevel, and swinging to the other side, the opposite edge is served in the same way, the grooving at each end or crozing, the chamfering of the ends, and sawing off, all being done by different cutters at the same time. Other machines saw the staves, and some cut them with great rapidity directly from the block; but these are for making what are called slack barrels, which do not need to be so perfectly tight and strong as those used to contain most liquids.—As a measure of capacity the barrel is of very variable dimensions, differing in size in the different states,

and with the material it is designed to hold. The measure of capacity called barrel bulk is 5 cubic feet. The old English measures were 81½ gallons for a barrel of wine, 32 for ale, and 36 for beer; but by a statute of 1 William and Mary the beer and ale barrel was equalized to 34 gallons. This, however, only created confusion. The dimensions of the barrel in England are as follows:

	Gallons.	Cubic inches.
Wine barrel.....	81½	7,816½
Ale barrel (London).....	32	9,024
Ale and beer barrel (England).....	34	9,518
Beer barrel (London).....	36	10,152

In the United States the barrel for wine, beer, and cider is 31½ gallons. The lamp-oil barrel of Cincinnati contains 43 gallons. The whiskey barrel usually contains from 40 to 45 gallons. In Maryland, a barrel of corn is equal to 5 bushels; a barrel of fish, 220 lbs.; a barrel of flour, 196 lbs.; and of lime, 320 lbs.

BARRELIER, Jacques, a French botanist, born in Paris in 1606, died Sept. 17, 1678. He renounced the medical profession to enter the Dominican order. In 1646 he was selected as assistant of the general of the order on one of his tours of inspection, travelled through France, Spain, and Italy, collected numerous specimens of plants, and also founded and superintended a splendid garden in a convent of his order at Rome, where he remained many years. He afterward returned to Paris and entered the convent in the rue St. Honoré. He left unfinished a general history of plants, to be entitled *Hortus Mundi*. The copper-plates of his intended work, and such of his papers as could be found, were collected and made the basis of a book by Antoine de Jussieu, *Plantas per Galliam, Hispaniam et Italiam observata*, &c. (folio, Paris, 1714).

BARREN, a S. county of Kentucky; area, 500 sq. m.; pop. in 1870, 17,780, of whom 3,623 were colored. Its name comes from the immense thinly timbered tracts it contains, which are technically termed "barrens." It is a moderately fertile region, watered by Barren river and two creeks. The superficial soil rests upon cavernous limestone, and sulphurous and saline springs are abundant. The Louisville and Nashville railroad, and its Glasgow branch, traverse the county. The chief productions in 1870 were 111,848 bushels of wheat, 603,541 of Indian corn, 179,609 of oats, 247,771 lbs. of butter, 40,492 of wool, 2,473,989 of tobacco, and 72 bales of cotton. Capital, Glasgow.

BARRETO, Francisco de, a Portuguese governor of the Indies, died on the banks of the Zambesi river in 1574. Distinguishing himself in the army at home, he was sent to command the fortress of Bassain in India, and was appointed governor in 1555. He sent the poet Camoëns into exile at Macao. By order of the Portuguese government he undertook the conquest of that ill-defined and little known portion of Africa called Monomotapa. He set out on this expedition in April, 1569, and

struck the continent where the Quillimane river runs into the Mozambique channel. His ambition was to penetrate to the mines of Massapa, whence the queen of Sheba was said to have drawn her treasures, and from which a nugget valued at 12,000 cruzadoes had lately excited cupidity in Portugal. In his explorations he fell a victim to the climate.

BARRETRY (sometimes called barratry), is criminal law, the offence of stirring up suits and quarrels. The person guilty of the offence may be indicted as a common barretor. To sustain the indictment it is necessary that there be proof of not fewer than three distinct acts, and that the suits or quarrels be between other persons. A man may bring any number of suits in his own name without being chargeable with this offence. A similar wrong is the bringing of suits by an attorney in the name of a fictitious plaintiff, which may be treated as a contempt of court.

BARRETT, Benjamin Flak, an American clergyman and author, born at Dresden, Maine, June 24, 1808. He graduated at Bowdoin college in 1832, and at the divinity school in Cambridge in 1838. While there he became a convert to the doctrines taught by Swedenborg. He was pastor of the first New Church society in New York from 1840 to 1848, and of that in Cincinnati from 1848 to 1850. In 1850 he was obliged to leave the pulpit on account of his health, and went to Chicago, where he engaged in a mechanical business by which in four years he restored his health, and accumulated a fortune. For several years subsequently he was settled over the first New Church society in Philadelphia. His principal works are: "A Life of Swedenborg," "Lectures on the New Dispensation," "Letters on the Divine Trinity," "The Golden Reed," "Catholicity of the New Church," "The Visible Church," "Beauty for Ashes," and "A New View of Hell." He has also published various theological pamphlets and articles in religious magazines.

BARRETT, George Horton, an American actor, born at Exeter, England, June 9, 1794, died in New York, Sept. 5, 1860. He arrived at Boston with his mother, an actress of some celebrity, in October, 1796, and made his first appearance the same year in the part of Cora's child in "Pizarro," at the age of two years. He commenced playing in New York in 1806, at the Park theatre, in the part of Young Norval. In 1826 he became manager of the Bowery theatre, New York, in company with E. Giffert. He afterward visited England, and in 1837 performed at Drury Lane. He was also manager of the Tremont theatre, Boston, and in 1847 opened the Broadway theatre, New York, then newly erected. In 1855 he retired from the stage. His favorite characters were in genteel comedy, but he also acted in farce and low comedy with great success. From his elegance and stateliness, he was known by the sobriquet of "Gentleman George."

BARRHEAD, a manufacturing village of Renfrewshire, Scotland, on the river Severn, 7 m. S. W. of Glasgow, with which it is connected by railway; pop. about 6,000. It contains cotton mills, bleaching and print works, an iron foundry, and a machine shop, employing in all about 5,000 operatives.

BARRIER REEFS, reefs of coral which rise from great depths among the South sea islands, at a distance of several miles from the coast, and extend along in front of it as a barrier against the heavy roll of the sea. The most remarkable of these is the Great Barrier reef off the N. E. coast of Australia. (See *AUSTRALIA*, vol. ii., p. 128.) Other reefs of this nature are met with along the opposite coasts of the islands of Louisiade and New Caledonia, and between are numerous coral islands.

BARRINGTON. I. John Shute-Barrington, viscount, an English lawyer and author, born in 1678, died Dec. 14, 1734. In early life he received by will the estate of John Wildman of Berkshire, not related to him and but slightly acquainted. He added the name of Barrington to Shute on acquiring an estate in Essex by the will of Francis Barrington, distantly related to him by marriage, and was created Viscount Barrington in the Irish peerage in 1720. He was expelled from parliament in 1722 for promoting a fraudulent lottery scheme, and devoted his latter years to theological studies. He published *Miscellanea Sacra* (2 vols. 8vo, 1725), and other works of repute. **II. William Wildman**, 2d viscount, son of the preceding, born in 1717, died Feb. 1, 1798. He was secretary at war, chancellor of the exchequer, and treasurer of the navy. **III. Daines**, a jurist and naturalist, brother of the preceding, born in 1727, died March 11, 1800. In 1757 he was appointed a Welsh judge, and afterward second justice of Chester. He published in 1766 "Observations on the Statutes, chiefly the more Ancient, from Magna Charta to the 21 James I., c. 27," a work of merit and authority; and in 1773 an edition of Orosius, with Alfred's Saxon version and an English translation. Most of his other writings, among which are dissertations on the singing and language of birds, on the Linnæan system, and on the probability of reaching the north pole, may be found in the publications of the royal and antiquarian societies, of both of which he was a member, and in his "Miscellanies on Various Subjects" (1781). **IV. Samuel**, a naval officer, brother of the preceding, died Aug. 16, 1800. He was rear admiral of the white, took St. Lucia in the face of a superior force, and distinguished himself at the relief of Gibraltar under Lord Howe. **V. Shute**, a prelate, brother of the preceding, born in 1734, died March 27, 1826. He was chaplain to George III., canon of Christ church, of St. Paul's, and of Windsor, and bishop successively of Llandaff, Salisbury, and Durham. Having gained the sum of £60,000 by a lawsuit, he devoted the whole of it to the foundation of charity schools and the

relief of poor clergymen. He edited the *Miscellanea Sacra* of his father, prepared for the press the "Political Life" of his brother Lord Barrington, and furnished valuable notes for a new edition of Bowyer's "Critical Conjectures" on the text of the Greek Testament.

BARRINGTON, Sir Jonah, an Irish lawyer and author, born in Queen's county in 1767, died at Versailles, April 8, 1884. He was called to the Irish bar in 1788, and entered the Irish parliament in 1790, as member for Tuam. His maiden speech as a legislator was directed against Grattan and Curran. A sinecure in the Dublin custom house, worth £1,000 a year, was given to him in 1793, and he was made king's counsel. When the question of the union came up, however, he changed sides, voting against it, and displaying such zeal for the liberals, that in 1803 he was very nearly returned to parliament for the city of Dublin in the popular interest, the first four votes in his favor being those of Grattan, Curran, Ponsonby, and Plunket. The Irish government tried to silence him by making him judge of the Irish admiralty court, and also knighting him. Between 1809 and 1815, dissatisfied at not having obtained higher preferment, he published the first volume of his "Historic Memoirs of Ireland," comprising secret records of the national convention, the rebellion, and the union, with delineations of the principal characters engaged in these transactions, bringing the narrative down to the assertion of independence by the Irish parliament. The government dreaded the publication of the concluding volume, which he threatened, and, it is said, induced him to abandon it on condition of receiving the full salary of his office while residing in France, where he was obliged to take refuge from his creditors, his duties being performed by a deputy chosen and paid by the government. In 1827 he published two volumes of "Personal Sketches of his own Times," and a third volume appeared in 1832. This has been twice republished in the United States with great success. In 1830 he was charged in parliament with appropriating to his own use funds belonging to suitors in his court. He went to London to plead his cause, but was removed from office. He now prepared the second volume of his "Historic Memoirs." This work was subsequently reproduced in a cheap form as the "Rise and Fall of the Irish Nation." His sketches are untrustworthy in their details, but give a good idea of political, literary, and social Irish life during the last 40 years of the last century.

BARRON, a N. W. county of Wisconsin, watered by Hay and Vermilion rivers; pop. in 1870, 538. The chief productions in 1870 were 1,665 bushels of wheat, 10,130 of oats, 1,850 of potatoes, and 401 tons of hay.

BARRON, James, an American naval officer, born in Virginia in 1768, died April 21, 1851. He served under his father, **JAMES BARROX** (died 1787), who held the rank of commodore

in the Virginia navy during the revolution. The son was commissioned lieutenant on the organization of the United States navy in 1798, and the next year promoted to be captain, and under the command of his elder brother, Commodore Samuel Barron, was ordered to the Mediterranean, where he became known for his skill in seamanship as well as his scientific attainments. On June 22, 1807, the frigate *Chesapeake*, 38 guns, Capt. Gordon, bearing the broad pennant of Com. Barron, got under way from Hampton Roads, bound to the Mediterranean, and was almost immediately boarded by a boat from the British ship *Leopard*, of 50 guns, Capt. Humphreys, conveying a despatch, signed by Vice Admiral Berkeley, ordering all captains under his command, should they fall in with the *Chesapeake* anywhere on the high seas, to search her for certain deserters from the British navy, concerning whom correspondence had taken place in Washington between the British minister and the secretary of state, their surrender being refused on the ground that they were American citizens who had been impressed into the British navy. Com. Barron refused to submit to this extraordinary demand, and in a very few moments afterward the *Leopard* fired a broadside into the *Chesapeake*. The American ship was in no condition to return it; besides her inferior force, she was in utter confusion on first coming out of port, and although the guns had been loaded, rammers, wads, matches, gun locks, and powder horns were all wanting. The *Leopard* continued to fire until Barron, finding that no resistance could be made, ordered the colors struck. A single gun was fired by the *Chesapeake* just as her colors were hauled down. There being no matches at hand, it was discharged by means of a coal brought from the galley. The ship received 21 shot in her hull, and 3 were killed and 18 wounded; among the latter were Com. Barron and his aid, Mr. Broom. Four men claimed as English were taken out of her, and she returned to Hampton Roads the same evening. Intense excitement was created throughout the country by this outrage. Barron was court-martialled under four charges, which embraced 22 specifications. He was entirely acquitted of three of the charges, but was found guilty of two specifications of a charge "for neglecting, on the probability of an engagement, to clear his ship for action," and sentenced to be suspended for five years, without pay or emoluments. The court closed its finding on the subject of the personal conduct of the accused in the following language: "No transposition of the specifications, or any other modification of the charges themselves, would alter the opinion of the court as to the firmness and courage of the accused; the evidence on this point is clear and satisfactory." Admiral Berkeley's conduct was disavowed by the British government, and he was recalled from his command. Capt. Humphreys was placed on half pay. Two of

the alleged deserters were afterward returned: one had been executed, and the fourth died. Barron entered the merchant service during his suspension, and remained abroad till 1814, when an attempt was made to restore him to duty. This was resisted by many officers, including Decatur, who had been a member of the court martial, and after a long and bitter correspondence Barron sent Decatur a challenge. The duel was fought at Bladensburg, March 22, 1820. Both fell at the first fire. Decatur died the same night, and Barron recovered after months of great suffering. During the latter years of his life he held several important commands on shore. The command of the squadron in the Pacific was tendered to him, but declined.

BARRON, Samuel, an American naval officer, brother of the preceding, born in Hampton, Va., about 1768, died Oct. 29, 1810. In 1798 he commanded the brig *Augusta*, which was prepared by the citizens of Norfolk to resist the aggressions of the French. During the war with Tripoli he took a conspicuous position, and in 1805 commanded a squadron of 10 vessels, his flag ship being the *President*, 44. The bashaw of Tripoli was Yusuf Caramalli, a usurper, who had deposed his brother Hamet. Mr. Eaton, the consul at Tunis, was apprised that it might be of great service to secure the cooperation of Hamet in the war against his brother. Commodore Barron received permission to follow this policy, and accordingly sent three vessels of the squadron, the *Hornet*, *Argus*, and *Nautilus*, with Mr. Eaton and Hamet, which captured the town of Derne on the Tripolitan coast, April 27, 1805. Eaton now pressed Com. Barron for further supplies and reinforcements against Tripoli, but they were denied on the ground that Hamet Caramalli ought to be able to effect his object by means of the ordinary cooperation of the squadron. Com. Barron was perhaps influenced in this decision by other considerations. Capt. Bainbridge, with his officers and men, were at this time held in rigorous captivity in Tripoli, and it was well known that the reigning bashaw had threatened a bloody retaliation. Com. Barron soon afterward relinquished his command to Capt. John Rodgers in consequence of extreme ill health, and returned to the United States. He was considered an excellent officer, and died much respected just as he had been appointed to the command of the navy yard at Gosport, Va.

BARRON, Samuel, an American naval officer, born in Virginia. He entered the U. S. navy as midshipman in 1812. He was attached to the *Brandywine* when she conveyed Gen. Lafayette to France in 1825; was promoted to be lieutenant in 1827, commander in 1847, and captain in 1855. At the breaking out of the civil war he was appointed chief of the bureau of detail in the navy department. He had already accepted a commission in the confederate navy, and soon went south, and was placed in

charge of the naval defences of North Carolina and Virginia, with the rank of flag officer. He was at Hatteras inlet at the time of the attack upon Forts Clark and Hatteras by Flag Officer Stringham, Aug. 28, 1861, and by request of the officers commanding the forts assumed the general direction of the defence. After the surrender he was sent to New York, and remained a prisoner of war until exchanged in 1862. During the remainder of the war he was in England, engaged in fitting out blockade-runners and privateers. After the close of the war he returned to Virginia and engaged in farming.

BARROS, João de, a Portuguese historian, born in 1496, died in 1570. He was of noble family and early employed about the court. In 1522 he was governor of a Portuguese settlement on the coast of Guinea, and afterward treasurer of the Indies. He was recommended by the king himself to cultivate history, some of his compositions having been read with approval by his majesty. He wrote the history of Portuguese conquest in India, down to 1526, under the title of *Asia*, in four decades (published 1552-1615). It was continued by Diego de Couto, the historiographer of Philip II. of Spain. The best edition is that of 1777-'8, from the royal press of Lisbon. He also wrote a chivalric romance, *Cronica do Imperador Clarimundo*, and many other works. His style is dignified and his diction elegant and pure. He has been styled the Portuguese Livy.

BARROT. I. Camille Hyacinthe Odilon, popularly known as ODILON BARROT, a French advocate and statesman, born at Villefort, department of Lozère, in July, 1791. His father was a revolutionist, but Odilon became after his admission to the bar in 1814 friendly to Louis XVIII.; but subsequently he was prominent in the opposition, and acquired great celebrity as an advocate, especially in political trials. He contributed as president of one of the principal political associations, and by his activity, to bring on the revolution of 1830, and was secretary of the Paris municipal committee which in July officiated for a few days as a provisional government. He opposed the establishment of a republic as well as the restoration of the elder Bourbons, and contributed much to make Louis Philippe king, but showed personal deference to the deposed monarch, escorting him and his family to Cherbourg. Louis Philippe appointed him prefect of the department of the Seine, but was not able to sustain him against the subsequent attacks of Guizot and his party, who especially censured his attitude during the trial of Polignac. The disorders following the funeral celebration by legitimists of the anniversary of the assassination of the duke de Berri, on which occasion he was accused of negligence, furnished a pretext for his removal, and on Feb. 19, 1831, he resigned the prefecture. He now became a leader of the moderate left in the chamber of deputies, opposing a hereditary peerage, promoting the revision

of the penal code and public instruction, and obtaining the repeated adoption of a divorce bill in the chamber, notwithstanding its rejection by the peers. He bore an important part in all the political events which preceded the revolution of 1848, as one of the most eloquent orators and influential statesmen of his day, and was the chief promoter of the famous reform banquets. He submitted to the chamber the act of accusation against the Guizot ministry, signed by 53 of his colleagues, and was appointed by Louis Philippe prime minister on Feb. 24. In this capacity it was his duty to announce the king's abdication and the accession of the duchess of Orleans as regent. He had flattered himself that his influence would allay the revolutionary storm; but he was disappointed, and the republic was proclaimed. He became a member of the constituent assembly, and labored in vain for the adoption of a constitution after the English model. Under the presidency of Louis Napoleon he was appointed minister of justice, with the privilege of presiding over the cabinet in the absence of the prince, Dec. 20, 1848. On April 16, 1849, he assumed the responsibility for the siege of Rome, but retired at the end of October on account of ill health. Subsequently failing to effect a reconciliation between the executive and the legislature, he was among the first to protest against the *coup d'état* of Dec. 2, 1851, and to join in the unavailing proclamation deposing Louis Napoleon. In 1863 he endeavored in vain to be elected to the chamber, and at the close of 1869 he declined to accept the ministry of justice, which was tendered to him by Napoleon III. In 1872 M. Thiers appointed him vice president of the council of state. **II. Victorin Ferdinand,** brother of the preceding, born in Paris, Jan. 10, 1806. He became a member of the chamber of deputies and solicitor of the treasury, and in 1848 he was elected to the constituent assembly for Algeria, and in the following year to the legislative assembly. Having been one of the counsel for Louis Napoleon in his trial for the attempt of Boulogne, he became on the accession of the latter to the presidency secretary general of his cabinet, and for a few months minister of the interior, after which he went in 1850 as minister to Turin, and was reelected to the legislative assembly. In January, 1852, he became a member of the consultative committee, and subsequently of the council of state in connection with public works, commerce, and agriculture. In 1853 he was made senator, and in 1865 secretary of the senate.

BARROW, the name given to ancient artificial mounds, constructed for purposes which it is sometimes impossible to discover, but which generally appear to have been commemorative of famous persons or events in the history of ancient peoples. They are formed either of earth or of stones, are mentioned in Joshua and Homer, and are found among the relics of Egyptian, Greek, Roman, and Scy-

thian domination. There are also in England and Scotland numerous barrows of Druid

a. Long Barrow. b. c. Druid Barrows. d. Bell Barrow.
e. Cone Barrow. f. Twin Barrows.

origin. Barrows are also found in large numbers in America, the memorials of an unknown history.

BARROW, a river of Ireland, next in size and importance to the Shannon, rises in the N. part of Queen's county, flows E. to the border of Kildare county, then turns to the south, forming the boundary between the counties of Queen's, Kilkenny, and Waterford on the W., and Kildare, Carlow, and Wexford on the E., passing the towns of Athy, Carlow, and New Ross, and after a course of about 100 m., with a descent of 227 feet, falls into the estuary which forms Waterford harbor. Near its mouth, 8 m. E. of Waterford, it is joined by the Suir, and near New Ross by the Nora. These three rivers are called the three sisters, from their rising in the same mountain ridge, and, after flowing through different counties, uniting near the sea. The Barrow is navigable for vessels of 300 tons as far as New Ross, 25 m., and for barges to Athy, 40 m. further, whence by means of the Grand canal it communicates with Dublin.

BARROW, Isaac, an English divine and mathematician, born in London in October, 1630, died there, May 4, 1677. He was the nephew of Isaac Barrow, bishop of Sodor and Man, and the son of Thomas Barrow, who, though of an ancient Norfolk family, was linendraper to Charles I., whom he followed to Oxford, subsequently attending Charles II. till the restoration. Young Isaac was admitted in 1643 as a pensioner in Peterhouse, Cambridge, and in 1645 entered Trinity college, obtaining the degree of M. A. in 1652 both in Cambridge and Oxford. In 1655 he set out for the continent and the East, and during his journey had a successful contest with an Algerine corsair, of which he wrote a poetical narrative; and in Constantinople he devoted himself to the study of Chrysostom. After his return he became

professor of Greek at Cambridge (1660), and of geometry at Gresham college (1662), and fellow of the newly established royal society (1663). In conformity with the will of Lucas, he was the first Lucasian professor of mathematics at Cambridge from 1663 to 1669, when he resigned this post to his pupil and friend Isaac Newton, and devoted himself to theology, his uncle giving him a small sinecure in Wales, and the bishop of Salisbury making him a prebendary. In 1670 he received the degree of D. D.; in 1672 he became master of Trinity college, the king, whose chaplain he was, regarding him as the best scholar of England; and in 1675 he was made vice chancellor of the university of Cambridge. In mathematics, and especially geometry, he had no superior except Newton, whom he was the first to encourage. In geometry he originated the idea of the incremental triangle, and paved the way for the fluxional and differential calculus of Newton and Leibnitz. His posthumous *Lectures Mathematicæ* (1783) are regarded as a model of sound principles. His principal mathematical works have been translated into English by Kirby and Stone, and by others, and were edited by the late William Whewell for the use of Trinity college, Cambridge (1861). In the latter part of his life he devoted himself exclusively to the church, and his pulpit discourses acquired great celebrity. His sermons were excessively long, but effective and logical, and he was honored as a prodigy of learning, wit, virtue, and piety. In his moments of leisure he composed Greek and Latin verses. He was buried in Westminster abbey, where a monument perpetuates his memory. The first edition of his theological and ethical writings, by Dr. Tillotson and Abraham Hall, appeared in 1685. An edition by the Rev. James Hamilton was published in Edinburgh in 1842, and in New York in 1845 (3 vols. 8vo).

BARROW, L. Sir John, an English traveller and author, born at Draleybeck, near Ulverstone, Lancashire, June 19, 1764, died in London, Nov. 28, 1848. He early wrote on land surveying, spent some time in a Liverpool iron foundry, visited Greenland, was professor of mathematics at Greenwich, and, on Sir George Staunton's recommendation, accompanied Lord Macartney as secretary to China, making himself conversant with the Chinese language, and subsequently was with him at Cape Town, as secretary and auditor of public accounts. The services which he rendered in the settlement of the newly acquired Cape Colony led to his being appointed in 1804 second secretary to the admiralty, which office he held till 1845, except for a short time in 1806. He was created a baronet in 1835. He promoted arctic expeditions and geographical science, and originated the plan of the geographical society, of which he was vice president. He wrote nearly 200 essays, chiefly geographical, for the "Quarterly Review," contributed to the "Encyclopædia Britannica," and published

"Travels in Southern Africa" (2 vols., London, 1801-'3); "Travels in China" (1804); "A Voyage to Cochinchina" (1806); lives of Macartney (1807), Lord Howe (1838), Lord Anson (1839), and Sir Francis Drake; "A Chronological History of Voyages into the Arctic Regions" (1818); "Voyages in the Arctic Regions since 1818" (1846); and other works, including his "Autobiographical Memoir" (1847), and "Sketches of the Royal Society" (1849). **II. John**, second son of the preceding, born June 28, 1808, has written "Visit to Iceland" (London, 1835), "Summer Tours in Central Europe" (1857), and other books of travel, and miscellaneous works; and prepared a new edition of Cook's "Voyages of Discovery" (Edinburgh, 1860).

BARROW-IN-FURNESS, a municipal borough, manufacturing town, and seaport of Lancashire, England, on the S. W. shore of the peninsula of Lower Furness, opposite Walney island, the terminus of the Furness railway, 4 m. S. W. of Dalton, and 50 m. N. N. W. of Liverpool; pop. in 1871, 17,992 (in 1847, only 300). The rapid progress of the town is due to its iron and steel works. The annual export of iron ore is estimated at 600,000 tons, and of copper ore at 3,000 tons. The steel works convert about 1,000 tons of pig iron weekly into Bessemer steel, the Barrow hematite iron and steel company being one of the largest establishments of the kind in the world. Great quantities of coal are imported from Wales, and of timber from Canada and the Baltic. The town received a charter of incorporation in 1867, and the duke of Devonshire, the chief owner of the land, inaugurated the new docks in the same year. They are unrivalled in Lancashire in extent and position, except by those of Birkenhead. The town contains a fine town hall and other public buildings. Bathing establishments, and a monument of Mr. Noble, the chief promoter of railway and manufacturing enterprise, were inaugurated in 1872.

BARROW STRAIT, a channel in Arctic America, named after Sir John Barrow, leading W. from Lancaster sound to Melville sound, in lat. 74° N., and between lon. 84° and 96° W. It averages 40 m. in width, and has a depth of 75 to 200 fathoms. Its coasts are mountainous. Capt. Parry first navigated it in 1819-'20.

BARRUNDIA, José Francisco, a Central American statesman, born in Guatemala about 1780, died in New York, Aug. 4, 1854. Many members of his family had acquired eminence in the service of Spain, but he early opposed the mother country, and in 1813 was sentenced to death for treason. He and his fellow conspirators hid themselves in the mountains for six years, when Barrundia placed himself at the head of the revolutionary party of Guatemala. He took a conspicuous part in the struggle for independence, and was a member of the first republican constituent assembly. On April 10, 1824, he introduced and carried

a decree for the immediate abolition of slavery throughout the republic, and he subsequently procured the adoption of a code modelled after that of Livingston for the state of Louisiana, which he had translated into Spanish. In 1825 he declined the office of vice president, but in 1829 accepted that of president, and devoted himself to educational and other reforms. When in 1852 three of the five states which had composed the old republic again united, he was unanimously chosen president; but two of the states withdrawing their adhesion, he also withdrew, and employed himself in preparing a narrative of Central American events. In the hope of regaining his ascendancy in Guatemala through American influence, he set out in 1854 for Washington as minister of Honduras, with the alleged design of negotiating for its annexation to the United States; but apoplexy ended his life soon after landing in New York.

BARRY. **I.** A S. W. county of Missouri, bordering on Arkansas, and drained by King's river, Flat creek, and White river of Arkansas; area, 703 sq. m.; pop. in 1870, 10,373, of whom 52 were colored. It has a hilly surface, in some places covered with forests, in others occupied by rich prairies. The principal rock is limestone. Lead exists in various parts of the county. The Atlantic and Pacific railroad skirts the N. border. The chief productions in 1870 were 71,669 bushels of wheat, 322,808 of Indian corn, 55,348 of oats, and 56,586 lbs. of tobacco. Capital, Cassville. **II.** A S. W. county of Michigan, intersected by Thornapple river; area, 576 sq. m.; pop. in 1870, 22,199. It has an undulating surface, occupied by alternate tracts of fertile prairie and woodland, and dotted with numerous small lakes. The Grand River Valley railroad passes through the county. The chief productions in 1870 were 575,149 bushels of wheat, 373,420 of Indian corn, 212,857 of oats, 12,568 of barley, 244,579 of potatoes, 28,899 tons of hay, 230,554 lbs. of wool, 628,171 of butter, and 138,698 of maple sugar. Capital, Hastings.

BARRY. **I.** Sir Charles, an English architect, born in London in May, 1795, died there, May 12, 1860. He studied in England and in Italy, travelled extensively, and after his return became the first architect in London, acquiring renown especially by his construction of the Reform and Travellers' club houses. His master-work is the new parliament houses. The corner stone was laid in 1840; the lords assembled in the new house in 1847, and the commons on Nov. 4, 1852. The queen knighted the architect on the opening of the new buildings. He was a royal academician, a fellow of the royal society, and a member of many distinguished bodies at home and abroad. **II.** Edward Middleton, son of the preceding, born in 1830. He perfected his knowledge of architecture under his father, whom he succeeded as architect of the new houses of parliament, and he also completed these and other buildings which were left

unfinished by him. Among his works are the new Covent Garden theatre, the Charing Cross, the Star and Garter at Richmond, and other hotels, the opera house at Malta, the grammar school at Leeds, and other famous structures. In 1867 he became architect of the new national gallery. In 1870 he was made a royal academician.

BARRY, Gerald, or Giraldus Cambrensis (Gerald of Wales), a British ecclesiastic and historian, born about 1146, died about 1220. His father was a Norman baron, his mother a descendant of princes of South Wales, and his uncle, David Fitz-Gerald, was bishop of St. David's. He completed his education in the university of Paris, and returned to that city in 1176, after the king's rejection of his appointment as his uncle's successor in the see of St. David's. He declined in 1179 a professorship of canon law in the university of Paris and went back to England, where for four years he was administrator of the see of St. David's during a vacancy of the bishopric, and afterward chaplain of the king, and secretary and privy councillor of Prince (afterward King) John during the latter's visit to Ireland. With Archbishop Baldwin he preached in 1188 in Wales in behalf of the crusaders. He was again elected to the see of St. David's in 1199, and according to some authorities finally obtained possession and resigned in 1203; but according to the commonly received account his nomination was not confirmed. He spent the last years of his life in literary pursuits, and wrote *Topographia Hibernia*, in three books; *Expugnatio Hibernia*, an account of the Norman conquest of Ireland; *Itinerarium Cambriae*, or account of the itinerary of Archbishop Baldwin through Wales, an English translation of which has been published by Sir Richard Colt Hoare, with annotations and a life of Giraldus ("The Itinerary of Archbishop Baldwin through Wales," 2 vols. 4to, London, 1806); *De Principis Instructione*; and many other works, of which the *Speculum Ecclesiasticum* and *De Gestis Giraldi laboriosus* are the most remarkable. Most of his works have been printed, either separately or in collections.

BARRY, James, an Irish painter, born in Cork, Oct. 11, 1741, died in London, Feb. 22, 1806. He studied in Dublin, and in Italy under the patronage of Burke. After his return to England in 1770 he painted for the society of arts in London a series of allegorical pictures of human progress, the best of which is that of the "Victors at Olympia." His charges against the administration of the royal academy led in 1797 to his expulsion from that body, and to his removal from the professorship of painting, which he had held for ten years, after which he received a public subscription of £1,000, and a year before his death, through Sir Robert Peel, the father of the premier, a government annuity of the same amount. He was irritable and quarrelsome, and lived most of his life in penury; but he

had noble conceptions of art, though his execution and coloring were generally defective. He wrote in 1775 "An Inquiry into the Real and Imaginary Obstructions to Art in England," in which he refuted Winckelmann's theory in respect to the unæsthetic influence of the English climate. His various works were published in 1809 in 2 vols., with his biography.

BARRY, John, an American naval officer, born at Tacumshane, county Wexford, Ireland, in 1745, died in Philadelphia, Sept. 13, 1803. He settled in Philadelphia about 1760, and acquired wealth as master of a sailing vessel. At the commencement of the revolution he offered his services to congress, and in February, 1776, was appointed to the command of the Lexington, 14 guns, and after a sharp action took the tender Edward, the first war vessel captured by a commissioned officer of the American navy. He was transferred to the Effingham frigate, and in 1777, in the Delaware, at the head of four boats, captured an English schooner. Finding naval operations interrupted by the ice, he served for a short time as aide-de-camp to Gen. Cadwalader at Trenton. In 1781, while returning from France in the Alliance, he captured the Atalanta and the Trepassy, and was severely wounded. After the establishment of the present navy in 1794, he was named as the senior officer with the rank of commodore.

BARRY, Marie Jeanne Comand de Vauvergne, countess du, mistress of Louis XV., born at Vaucouleurs, in Champagne, Aug. 19, 1746, guillotined in Paris, Dec. 6, 1793. She was the daughter of a seamstress, and was employed in a milliner's shop in Paris, where she led a dissolute life. One of her lovers, Count Jean du Barry, brought her through his valet to the notice of Louis XV., who made her marry the count's brother, after which she was introduced at court. By her beauty and wit she retained the king's affection until his death. She cost France over 35,000,000 francs, out of which she provided for her relatives and friends, and also to some extent for charitable works. She persuaded the king to banish his prime minister, the duke de Choiseul, her unrelenting enemy, and to dismiss and exile the parliament of 1771. On the king's death Louis XVI. banished her from court, but after a year she was permitted to return to the wing of the royal palace which had been built for her use at Lucienne, near Versailles, and lived there with her lover, the duke de Brissac, in shameful luxury. After a journey to England she was arrested in July, 1793, upon a charge of having squandered public funds, conspired against the republic, and worn mourning in London for the royal family. Sentenced to death Dec. 6, she bore herself with fortitude during the trial, but her courage deserted her on the way to the scaffold, and to the last moment she continued her piteous appeals for mercy. She was an illiterate woman, though she patronized some small poets.

BARRY, Martha, an English physiologist, born at Stratton, Hampshire, in March, 1802, died at Beccles, Suffolk, April 27, 1855. He received his doctor's diploma in Edinburgh in 1833, and was house surgeon of the royal maternity hospital in that city. He was the first to demonstrate, in his contributions to the "Philosophical Transactions" of the royal society of London (1840-'43), that spermatozoa actually penetrate within the ovum. He also established the fact of the segmentation of the yolk in the mammals, and made other discoveries in embryology.

BARS (Ger. *Barach*), a county of N. W. Hungary, traversed by the Gran; area, 1,081 sq. m.; pop. in 1870, 137,191, more than half of whom are Slovaks, and the rest Magyars, Germans, and Jews. It is mountainous in the north, where the rocky soil is unfavorable to agriculture, though fitted for cattle breeding. The south is very fertile. The county is chiefly celebrated for its mineral wealth, which embraces gold, silver, copper, iron, lead, and antimony; but the production of the precious metals is declining. The richest mines are those of Kremnitz, the Austro-Hungarian gold (Kremnitz) ducats being coined in that town. Capital, Aranyos-Maróth.

BARSAC, a village of France, in the department of the Gironde, 21 m. by railway S. E. of Bordeaux; pop. in 1866, 3,076. It produces famous white wines which belong to the vintage of Graves. The ordinary Barsac is less delicate but stronger than Preignac, but the wines of upper Barsac are remarkable alike for strength and aroma. When old, the color becomes that of ambergris.

BARSUMA, or **Barsumas**. I. A Nestorian bishop of the 5th century, died about 489. Having been expelled from the school of Edessa, he took refuge in Persia, accompanied by many of his followers, and in 435 was created bishop of Nisibis. He acquired great influence with the Persian king Ferozes, whom he induced to expel all Christians who adhered to the teachings of the Greek fathers, and not only to admit Nestorians in their place, but to allow them to establish themselves in the chief cities, Seleucia and Ctesiphon. He established the famous school at Nisibis, from which went forth missionaries who in the next century carried the Nestorian doctrines into Syria, Egypt, Arabia, India, Tartary, and China. The Nestorians of Persia and the neighboring countries still venerate him as the parent and founder of their faith. He upheld the right of the clergy to marry, and himself espoused a nun named Mammæa. He was the author of discourses, homilies, hymns, and a Syriac liturgy, none of which are extant. II. A Syrian archimandrite, who headed the Eutychian party at the so-called "robber council" of Ephesus in 449. By the Jacobites he is held to have been a saint and worker of miracles.

BAR-SUR-AUBE, a town of France, department of Aube, on the river Aube, 29 m. E. S.

E. of Troyes; pop. in 1866, 4,809. It is very ancient, and has some old churches, a hospital founded in the 11th century, and a college. In January and February, 1814, it was the scene of two battles, in consequence of which it was nearly destroyed. It has a trade of some importance in breadstuffs, wine, wood, hemp, and wool, and has extensive nurseries of fruit and ornamental trees.

BAR-SUR-SEINE, a town of France, department of Aube, on the Seine, 16 m. S. S. E. of Troyes; pop. in 1866, 2,770. It was a large place in the middle ages, but it was several times ruined during the Burgundian wars. On March 1, 1814, a battle was fought under its walls between the French under Macdonald and the Austrians under the prince of Würtemberg. It trades in breadstuffs, wines, brandies, wool, and hemp.

BART, or **Bert, Jean**, a French naval officer, born at Dunkirk, Oct. 20, 1651, died there, April 27, 1702. He was the son of a fisherman, and early took to the sea. The royal navy being at this period inaccessible to persons of his class, he distinguished himself in command of a privateer. Louis XIV. commissioned him to cruise in the Mediterranean, and in 1697, in consequence of his bravery, appointed him captain of the squadron during the French war with the Netherlands. Bart became by his unexampled feats of daring the terror of the enemy. On one occasion, a famine existing in France, he recaptured from the Dutch 100 vessels loaded with grain. At another time, when Dunkirk was blockaded, taking advantage of a fog, he sailed through the English and Dutch fleets, and destroyed 86 merchantmen; then making a descent near New-castle, he destroyed 200 houses, and returned safely with property valued at 500,000 crowns. He was married twice, and had 18 children. His elder son, **FRANÇOIS** (born in 1677, died in 1755), became vice admiral. Jean's brother **GASPARD** was likewise a brave sailor, as were also other members of the family, the last of whom died in the French West Indies in 1843, with the rank of lieutenant. M. Vanderest's *Histoire de Jean Bart* was adopted in 1841 as a text book in the maritime schools of France. A statue of Jean Bart was erected at Dunkirk in 1845.

BARTAS, Guillaume de Salluste du, a French poet, born in Gascony in 1544, died in 1590 of wounds received at the battle of Ivry. His principal poem is *La première semaine, ou la création*, which passed through 30 editions in six years. It was translated into English by John Sylvester. The most complete edition of this now obsolete work is that of 1611 (2 vols., Paris).

BARTFELD (Hun. *Bártfa*), a town of North Hungary, in the county of Sáros, on the river Topla, near the Galician frontier, 155 m. N. E. of Pesth; pop. in 1870, 5,803. It is an old royal free town, has a gymnasium, and carries on trade in wine, brandy, earthenware,

and linen. It was formerly an important emporium of the trade with Galicia, but its commercial activity has declined. It contains a Gothic church with fine works of art, and a town hall with many valuable historical records. The town was founded early in the 14th century, and the first general synod of Hungarian Protestants was held here. About 2 m. N. of the town are mineral springs salutary in nervous and other diseases. The water is excessively strong and cold even in summer, but never freezes, and it is extensively exported. It is drunk cold and used in hot baths.

BARTH, a town of Germany, in the Prussian province of Pomerania, at the mouth of the river Barth, which forms its port, 14 m. W. of Stralsund; pop. in 1871, 5,774. In the 15th century it was a commercial town of considerable importance and the residence of several dukes of Pomerania. It still has a large coasting trade. From 1680 to 1815 it belonged to Sweden.

BARTH, Christian Gottlieb, a German divine and philanthropist, born in Stuttgart, July 31, 1799, died in Tübingen, Nov. 12, 1862. He was educated at Stuttgart and Tübingen, and in 1824 was appointed pastor at Möttlingen in Württemberg. In conjunction with the missionary institute of Basel he instituted a missionary society in Württemberg, and published a periodical, the *Calwer Missionsblatt*, devoted to the enterprise. He travelled in Switzerland, France, and England, in the interests of the missionary cause, and founded at Calw an institute for training poor children. His books have had an almost unexampled circulation. Of the "Bible History" and "Bible Stories" a million copies have been published in more than ten languages. He was a fluent versifier, writing hymns and short poems for children, many of which have been introduced into popular German collections. His principal works are: *Biblische Geschichte für Schulen und Familien*, often republished; *Kirchengeschichte für Schulen und Familien* (Calw, 1835); *Christliche Gedichte* (Stuttgart, 1836); and *Kinderblätter* (Calw, 1836).

BARTH, Heinrich, a German explorer and traveller, born in Hamburg, Feb. 16, 1821, died in Berlin, Nov. 25, 1865. He was educated at Hamburg and Berlin, travelled through Italy and Sicily, and in 1845 began explorations in Africa. Starting from Tangier in Morocco, he proceeded along the coast of Algeria, Tunis, and Tripoli, making excursions into the interior, reached Benghazi, and thence went across the desert to Egypt. During this journey he was attacked by wandering Arabs, severely wounded, and robbed of his papers. He traversed Egypt, the peninsula of Sinai, Palestine, Asia Minor, the islands of the Ægean sea, and Greece. In this journey he expended \$14,000 from his own fortune. Part of the results of his enterprise appeared in 1849 in his *Wanderungen durch die Küstenländer des Mittelmeeres*, of which only the first volume was

ever written; for while engaged in preparing the second he received a proposition from the British government to undertake an expedition into central Africa, as scientific associate of James Richardson. In the winter of 1849-'50 Richardson, Overweg, and Barth met at Tripoli, having procured a boat for the navigation of Lake Tchad. Barth made a preliminary trip through Tripoli, and on April 2, 1850, the three explorers set out for the interior of Africa, joining the great semi-annual caravan for Bornoo. On May 6 they reached Moorzook, the capital of Fezzan, which they left June 13, proceeding in a S. W. direction through the territory of Air or Asben, which had never before been visited by Europeans. Barth left his companions to visit a remarkable mountain which appeared to be only a few hours distant, but proved to be much further. He lost his way, and for 28 hours remained without water, preserving his life by sucking the blood from his own arm. He was at length found, and the natives looked upon him as a demigod, for they had never known any one to live more than 12 hours without water in the hot desert. Before reaching Agadez the travellers were attacked by fanatical Moslems, and narrowly escaped death. At Tintellust they were detained from September to December, 1850, by a native chief. Effecting their release by an appeal to the sultan of Ennoor, they went on to Agadez, where they separated, intending to reunite at Kuka in April. Richardson died March 4, when six days' journey from the rendezvous, but Barth was able to secure his papers, which he forwarded to England. At Kuka Barth was kindly received by the sultan of Bornoo, whose vizier lent him \$100, his funds being exhausted, and no remittances having arrived. Overweg had in the mean time made an independent excursion toward Sackatoo, and rejoined Barth at Kuka May 7. During these journeys both travellers found articles of American manufacture among the wildest tribes, which they supposed had been received in exchange for slaves. The travellers again separated, Barth setting out for Adamawa, with an escort from the sultan of Bornoo, May 23. For four weeks he travelled southward through forests abounding with lions and elephants. On June 19 he came upon the great river Bornoowa, at its junction with its affluent the Faro, and at once correctly conjectured that it must be the same with the Tchadda, or eastern branch of the Niger, described by the Landers and others. Arriving at Yola, the capital of Adamawa, some defect in etiquette was found in the letters with which he had been furnished by the sultan of Bornoo, and he was ordered to leave the country within three days. He turned back, and reached Kuka July 22. Overweg had reached Lake Tchad with the boat which had been brought overland from Tripoli, and had spent five weeks in exploring it, being the first European who had ever sailed upon its waters. The travellers remained at Kuka till November,

1851, when they planned another journey to Kanem and Borgoo, a vast unexplored region lying N. E. of the lake, and stretching half way to Nubia; but they were assailed by Arabs, and forced to return to Kuka. They found the sultan about to send an army 20,000 strong to subjugate Mandara, a country S. E. of Bornoo. They joined this expedition, which after marching 200 miles returned in triumph, with a booty of 5,000 slaves and 10,000 cattle. After resting nearly two months, Barth, near the close of March, 1852, set out for Baghirmi, a kingdom E. of Bornoo, which no European had ever visited. Here he was again forced to return, reaching Kuka Aug. 20. During his absence Overweg tried to penetrate the Fellatah kingdom of Yakoba, N. W. of the Benouwe, but his health was shattered, and he returned to Kuka, near which place he died, Sept. 27, 1852. Barth was now alone; but fresh funds reaching him from the English government, he resolved to pursue his explorations, sending his papers to England, with a request that another associate should be provided for him, and fixing upon the kingdom of Timbuctoo as his destination. He had sound health, goods for presents worth \$200, four camels, as many horses, and five trusty servants, all well supplied with arms and ammunition. The party left Kuka Nov. 25, 1852, reached Sackatoo in April, and Timbuctoo Sept. 7, 1853. For many months nothing was heard of Barth except a rumor that he was dead. Meanwhile Edward Vogel, a German employed as an assistant to the British royal astronomer, volunteered to go in search of him. He was attended by a company of sappers and miners. At Tripoli he was joined by Mr. Warrington, son of the British consul. They reached Kuka in December, 1853. Here Warrington died; but Vogel learned that Barth was alive, and had left Timbuctoo, where he had been detained nearly a year. The vizier of Bornoo had forwarded the report that he had died, hoping that this would soon be the case, so that the supplies of the expedition might fall into his own hands. But civil troubles arising, the vizier was deposed, and Barth was protected by the sheik of Timbuctoo, who furnished him with an escort as far back as Sackatoo. He succeeded in exploring the middle course of the Quorra or Niger, which had not been before done by any European except Mungo Park, whose journal perished with him; he also discovered two considerable kingdoms, Gando and Hamd-Allahi, the existence of which had before been unknown. On Oct. 17 he reached Kano, the largest town in central Africa, where, his funds being exhausted, he succeeded in procuring a loan by paying 100 per cent. interest. On Dec. 1, 1854, he was met by Vogel, the first European he had seen since the death of Overweg, more than two years before. Having wintered at Kuka, Barth started for home in May, 1855, and reached Marseilles Sept. 8, having been absent nearly six years. After visiting his friends in Germany, he went to London to

prepare an account of his explorations. The "Travels and Discoveries in North and Central Africa" appeared simultaneously in English and German (5 vols., London and Gotha, 1855-'8), with numerous illustrations, many of them colored, and elaborate maps of his various routes. This is Barth's great work, and, though heavy and diffuse in style, it is still the most valuable book of African travel which has appeared. Barth made it a point, wherever he was, to study the language and history of the country, and he brought to light much that would otherwise have been wholly lost to the student. Having completed the account of his African travels, he made several other journeys, of which he published accounts: *Reise von Trapezunt durch die nördliche Hälfte Kleinasien nach Scutari* (Gotha, 1860); *Reise durch das Innere der europäischen Türkei* (Berlin, 1864); and in 1865 he made a tour in Albania and Montenegro. At the time of his death he was professor extraordinary of geography in the university of Berlin. His posthumous work, *Sammlung Centralafrikanischer Vocabularien*, appeared in 1866.

BARTHELEMY, Auguste Marseille, a French poet, born in Marseilles in 1796, died there, Aug. 23, 1867. He excelled as a satirist, and his *Rome à Paris* (1826) passed through many editions. About 1825 he formed a literary partnership with Méry, another satirical poet, and together they published *La Villéluade*, an attack on the ministry of Villele, and in 1828 *Napoléon en Égypte*, copies of which were sent to every member of the Bonaparte family. In 1829 he published *Le fils de l'homme*, an account of a visit to the duke of Reichstadt, for which he was fined and imprisoned. He was alternately a satirist of the government and of the opposition, his course being determined by pensions, fines, and imprisonments. Among the latest of his many productions was *Le deux décembre* (1852), a vindication of Louis Napoleon's *coup d'état*.

BARTHELEMY, François, marquis de, a French diplomatist, born at Aubagne, Oct. 20, 1747, died in Paris, April 3, 1830. He was educated by his uncle, Jean Jacques Barthelemy, and became prominent in the diplomatic service, especially at Basel, where in 1796 he negotiated the first treaties of peace of the republic with Spain, Prussia, and Hesse-Cassel. He was a member of the directory, and after the 18th Fructidor was transported with Pichegru to Guiana, whence he escaped to the United States and to England. He was among the first recalled by the first consul, who made him a senator, and afterward a count. He voted to make Bonaparte consul for life, and presided in 1814 over the senate which deposed the emperor, for which Louis XVIII. created him a peer. After the hundred days he was made a minister of state and marquis. His motion in 1819 for reducing the electoral vote became one of the principal sources of political agitation during the restoration.

BARTHÉLEMY, Jean Jacques, a French archaeologist and author, born at Cassis, Jan. 20, 1716, died in Paris, April 30, 1795. He was educated for the church, and retained the title and costume of an abbé, but devoted himself chiefly to archaeological studies. In 1753 he became director of the cabinet of medals and coins, which he made the most renowned and extensive collection in the world. While visiting Italy in 1754-'7 for the acquisition of ancient medals, he formed the acquaintance of M. de Stainville, afterward duke de Choiseul and prime minister, who placed him in possession of handsome revenues; and though Barthélemy made a modest use of his good fortune, it yet exposed him to the animosity of D'Alembert and others. As early as 1748 he was admitted to the academy of inscriptions and belles-lettres, and in 1789 he was elected to the French academy. He was arrested in 1793, but released through the intervention of the minister of the interior. He wrote many learned disquisitions on numismatics and archaeology, published a romance and some poetry, and left the MS. of his *Voyage en Italie* (edited by Sérieys, Paris, 1802); but his fame rests on his *Voyage du jeune Anacharsis en Grèce* (4 vols., 1788), on which he labored 30 years, and which has passed through many editions, serving for a long time as a text book on ancient Greece. It has been translated into English and most other European languages.

BARTHÉLEMY-SAINT-HILAIRE, Jules, a French savant, born in Paris, Aug. 19, 1805. He was employed in the ministry of finance and as assistant professor of French literature in the polytechnic school till 1838, when the first portion of his translation of Aristotle gained for him the chair of Greek and Latin philosophy in the collège de France, followed the next year by a seat in the academy of moral and political sciences. In 1840 he served for some time under Cousin in the ministry of public instruction. He became connected with the *Globe* and other newspapers, was an earnest opponent of Charles X. and of Louis Philippe, and after the revolution of 1848, as member of the constituent and legislative assemblies, was one of the leaders of the conservative republicans. He made an unsuccessful attempt to have Gen. Cavaignac censured for the ineffectiveness of the measures taken to suppress the insurrection of June in its beginnings. He denounced the usurpation of Louis Napoleon in December, 1851, and for a short time was a prisoner at Mazas. He resigned his connection with the collège de France, which had been placed under his direction, and did not resume his professorship till 1862. In the mean time he had cooperated with M. de Lesseps in the Suez canal project (1855-'8), and visited Egypt as one of the representatives of that enterprise. In 1869 he was elected to the national assembly, and in 1871 he became secretary general of the cabinet of his old and intimate friend M. Thiers, with whom he was elected in 1872 member of

the geographical society. His translation of the works of Aristotle (17 vols. 8vo, 1837-'46) is the first complete French version, and is very fully annotated. He has also published a memoir *De la Logique d'Aristote* (2 vols. 8vo, 1838). Among his other works are several on Buddhism, *Mahomet et le Coran* (1865), and *Philosophie des deux Ampère* (1866).

BARTHEZ, or Barthès. I. Paul Joseph, a French physician, born at Montpellier, Dec. 11, 1734, died Oct. 15, 1806. He early acquired renown as an army physician, and about 1760 became a professor in the medical school of Montpellier, and in 1773 coadjutor and prospective successor of the chancellor of the faculty. He was also received doctor of law in 1780, and appointed councillor in the court of aids. His haughty character led him into disagreements with his colleagues, wherefore he removed to Paris in 1781, and became consulting physician to the king, member of the council of state, and of many learned societies. He lost his places at the revolution, but was afterward honorary professor at Montpellier, and received many tokens of regard from Napoleon. He explained the animal economy by the theory of a vital principle, and has been called the Hegel of medical science. His method is stated in his *Nouveaux éléments de la science de l'homme* (Montpellier, 1778; enlarged ed., 2 vols., Paris, 1806), which has been translated into most European languages. His *Nouvelle mécanique des mouvements de l'homme et des animaux* (Carcassonne, 1798), and his *Traité des maladies gouteuses* (2 vols., Paris, 1802; new ed., 1819), have been translated into German. Among his other numerous writings are two posthumous works, *Traité du beau* (edited by his brother, 1807), and *Consultations de médecine* (2 vols., 1810). **II. Antoine Charles Ernest de**, a French physician, grand-nephew of the preceding, born at Narbonne about 1800. He received his doctor's diploma in Paris in 1823, became physician to several hospitals, and prepared with M. Riiliet his *Traité clinique et pratique des maladies des enfants* (new ed., 3 vols., Paris, 1853-'4), which won prizes from the medical academy and academy of sciences.

BARTHOLD, Friedrich Wilhelm, a German historian, born in Berlin, Sept. 4, 1799, died Jan. 14, 1858. He studied history under Raumer, and was teacher at the Frederick's college of Königsberg (1826-'31), and professor of history at the university of Greifswald (1831-'58). His principal works are: *Der Römerrug König Heinrich's von Lützelburg* (2 vols., Königsberg, 1830-'31); *Geschichte des grossen deutschen Krieges von Gustav Adolf's Tode ab* (Stuttgart, 1841-'3); *Geschichte der deutschen Städte und des deutschen Bürgerthums* (4 vols., Leipzig, 1850-'52); and *Geschichte der deutschen Haasa* (Leipzig, 1854).

BARTHOLDY, Jakob Solomon, a German diplomatist and patron of art, born in Berlin, May 13, 1779, died in Rome, July 27, 1825. He was of a rich Jewish family, studied at Königsberg,

spent several years in Paris, visited Italy and Greece, and in 1805 became a convert to Protestantism. He fought in the Austrian army against the French, and roused the national spirit by his *Krieg der tiroler Landleute*, 1809 (Berlin, 1814). In 1813 he held a place in the Prussian chancery under Hardenberg, attended the congresses of Vienna and Aix-la-Chapelle, and was consul general in Italy from 1815 to 1818, and afterward chargé d'affaires in Florence. He published in 1815 an anonymous biography of his friend Cardinal Consalvi, employed Cornelius Overbeck, and other German artists in Rome in fresco painting, and left a large art collection, the greater part of which, chiefly bronzes, vases, and terra cotta, has passed into the possession of the museum of Berlin.

BARTHOLIN. I. *Kaspar*, a Danish physician and savant, born at Malmö, Sweden, Feb. 12, 1585, died in Copenhagen, July 13, 1629. He taught medicine in Basel, practised at Wittenberg, and was successively professor of rhetoric, medicine, and theology at the university of Copenhagen. His principal work, *Institutiones Anatomicae* (Wittenberg, 1611), has passed through several editions and been translated into foreign languages. II. *Thomas*, son of the preceding, born in Copenhagen, Oct. 20, 1616, died at Hagested, Dec. 4, 1680. He was a physician, professor of mathematics, and for 11 years of anatomy, in Copenhagen, and finally became physician to the king, director of the university library, and adjunct judge of the supreme court. He is especially distinguished as the reputed discoverer of the lymphatic system of vessels, though the priority in this matter was contested by Olaus Rudbeck of Sweden. His works were very numerous, the most important being *De Lacteis Thoracis in Homine Brutique* (Copenhagen, 1652), and *Vasa Lymphatica nuper Hafnia in Animalibus inventa et in Homine, et Hepatis Ezequia* (1653).

BARTHOLOMEW, a southeastern county of Indiana, drained by Flat Rock creek and Driftwood fork of White river; area, 375 sq. m.; pop. in 1870, 21,133. The eastern part is generally level, but in the west are hills of some elevation. The Jeffersonville, Madison, and Indianapolis railroad and its Shelbyville division pass through the county. In 1870 the chief productions were 491,424 bushels of wheat, 1,529,675 of Indian corn, 111,839 of oats, 67,352 of potatoes, 9,370 tons of hay, 221,086 lbs. of butter, and 47,590 of wool. There were 6,189 horses, 4,372 milch cows, 7,816 other cattle, 15,838 sheep, and 38,546 swine. Capital, Columbus.

BARTHOLOMEW BAYOU, a large stream of the S. W. United States, rises N. W. of Pine Bluff, Jefferson county, Arkansas, and flows very tortuously S. E., S., and S. W. into the Washita river at Washita City, Morehouse parish, Louisiana. It is navigable by steamboats for 250 m.

BARTHOLOMEW. I. *Valentine*, an English painter, born Jan. 18, 1799. He acquired renown as a flower painter, and has been for

over 80 years a member of the society of water-color painters. II. *Anne Charlotte*, a miniature and flower painter and poetess, second wife of the preceding, born at Loddon, Norfolk, early in this century, died Aug. 18, 1862. She was a daughter of Mr. Arnall Fayermann and a niece of Dr. John Thomas, bishop of Rochester. In 1827 she married Mr. Walter Turnbull, a composer of popular songs, who died in 1838; and in 1840 she became the wife of Mr. Valentine Bartholomew. She was a member of the society of female artists, and published "The Songs of Azrael," a volume of poems; "The Ring, or the Farmer's Daughter," a play (1829); and "It's Only my Aunt," a farce (1849).

BARTHOLOMEW, Saint, one of the twelve apostles, a native of Galilee, and generally supposed to be the same as Nathanael, who is mentioned by St. John among the first disciples of Christ. According to Eusebius and other ancient authors, he preached the gospel in the Indies, under which name they generally include not only India proper, but also Arabia and Persia. It is related that in the third century traces of Christianity were found in those countries, and that a copy of St. Matthew's Gospel in Hebrew was preserved by the natives, who had a tradition that St. Bartholomew left it there when he came among them to preach the faith. He afterward journeyed into Phrygia, met St. Philip at Hierapolis, and thence passed into Lycaonia. Beyond this we are told little of his life and travels, and even the meagre accounts which we have received are of doubtful authenticity. The place and manner of his death are equally uncertain. Modern Greek writers assert that he was crucified at Albanopolis; others that he was flayed alive. As we know that it was not unusual in some parts of the East to unite these two barbarous punishments, it is possible that both accounts may be true. The relics of this apostle have undergone many vicissitudes. We hear of them at Dura in Mesopotamia, in the island of Lipari, and at Benevento. It is believed by Roman Catholics that they rest beneath the high altar in the church of St. Bartholomew at Rome. A gospel anciently attributed to St. Bartholomew was declared apocryphal by Pope Gelasius I. A collection of writings also ascribed to him, but doubtless without reason, is known to have existed during the first four centuries of the Christian era, although no part of it now remains. His festival day in the Roman church is Aug. 24, and in the Greek June 11.

BARTHOLOMEW, Saint, Massacre of, the slaughter of Huguenots in France on St. Bartholomew's day (Aug. 24), 1572. It is maintained on the one hand that it was the result of a plot laid long beforehand to annihilate the Huguenots, in which religion had the prominent part; on the other, that it was a sudden outbreak, arising wholly from political motives. A desperate struggle had for many years been waged in

France between the Catholics and the Huguenots, in which both parties committed numerous outrages. It took finally the form of a conflict between the houses of Guise and Condé. The feeble Charles IX. was now king, his mother Catharine de' Medici being the real sovereign. It being certain that neither Charles nor his brother Henry would have children, Henry of Navarre, afterward Henry IV., was the next heir to the throne. He was by birth and education a Protestant, and had distinguished himself in war. In 1570 a peace had been patched up between the parties, which was to be rendered more secure by the marriage of Henry with Margaret of Valois, the sister of the king. August 18, 1572, was fixed upon for the wedding, and many of the principal Huguenots were gathered in Paris. On the 22d Admiral Coligni, one of the foremost Huguenots, was fired upon by an assassin named De Maurevel, known to have been a creature of Catharine, who was jealous of the influence which the admiral had acquired over the king. It has been maintained by many that the marriage between Henry and Margaret was a scheme intended only to collect the Huguenot leaders in Paris in order that they might all be put to death at once, and that the assassination of the admiral was to be the signal for a general massacre. Coligni was not killed, but severely wounded. The king visited him, and swore that the assassin should be punished. The Huguenots were alarmed, and uttered violent threats. Catharine persuaded her son that they were on the point of massacring the Catholics, and that the only thing to be done was to anticipate them. At her urgency, Charles in the night of the 23d gave an order for a general massacre of the Huguenots, the signal to be the tolling of the matin bell of St. Germain l'Auxerrois. The execution of this measure was intrusted to the duke of Guise and the Italian guards of the palace, supported by the companies of the burghers. Orders were also sent to all the principal provincial cities, directing a simultaneous massacre throughout France. It is said that the king was reluctant to give these orders, and that at the last moment he countermanded them; but the duke of Guise, to whom the counter-order was given, replied that it was too late, and mounting his horse rode off toward the hotel of Coligni, for the completion of the murder of the admiral was the first step to be taken. A band of assassins burst into his apartment, ran him through the body, and flung the corpse from the window into the street, where the duke of Guise was waiting on horseback. He dismounted and wiped the blood from the face of the victim in order to be sure that there had been no mistake as to the person. At 4 o'clock in the morning the signal was given, and the general massacre commenced. It is said that Charles, with his brother Henry of Anjou and their mother, was at the time in the tennis court; that he

was at first overcome with horror, but soon began himself to fire from the windows of the Louvre. But this statement rests upon insufficient authority, and is inconsistent with his conduct before and after. He died 21 months after the massacre, not without suspicions of having been poisoned by his mother and brother, although the Huguenots ascribed his death to the direct visitation of God. His agony of mind and body was extreme. He "sweat blood," say credible historians, "from every pore," and died exclaiming, "Oh, how much blood! how many assassinations! Oh, what evil counsels have I followed! O Lord God, pardon me, and have mercy upon me!" The slaughter in Paris lasted for several days. Condé and Henry of Navarre escaped by attending mass, and pretending to become Catholics; but most of the Huguenots gathered in Paris were killed. But the slaughter was not confined to them. Many who had grudges to avenge, or something to gain by the death of others, took occasion to gratify their malice or cupidity. The orders for the massacre were executed in nearly all the cities and towns of France where Huguenots were to be found as speedily as they could be received from Paris. It occurred at Meaux on Aug. 25; at La Charité on the 26th; at Orleans on the 27th; at Saumur and Angers on the 29th; at Lyons on the 30th; at Troyes on Sept. 2; at Bourges on the 11th; at Rouen on the 17th; at Toulouse on the 23d; at Romans on the 30th; at Bordeaux on Oct. 3. Many districts and towns, however, were spared, generally through the opposition of their governors or local authorities. The number of persons put to death in all France is variously stated at 100,000 to 1,500. The former number is doubtless much too great; the latter much too small. The estimate of De Thou, 20,000, is probably near the truth.—The subsequent conduct of the French government throws considerable light upon the origin of the massacre. Lingard states it as follows: "The bloody tragedy had been planned and executed at Paris with so much expedition that its authors had not determined on what ground to justify or palliate their conduct. In the letters written the same evening to the governors of the provinces and to the ambassadors at foreign courts it was attributed to the ancient quarrel and insatiate hatred which existed between the princes of Lorraine and the house of Coligni. But as the duke of Guise refused to take the infamy on himself, the king was obliged to acknowledge in parliament that he had signed the order for the death of the admiral, and sent in consequence to his ambassadors new and more detailed instructions. La Motte Fénelon, the ambassador to England, assured Elizabeth that Charles had conceived no idea of such an event before the preceding evening, when he learned with surprise and astonishment that the confidential advisers of the admiral had formed a plan to avenge the attempt made on

his life by surprising the Louvre, making prisoners of the royal family, and putting to death the duke of Guise and the leaders of the Catholics; that the plot was revealed by one of the council whose conscience revolted from such a crime; that his deposition was confirmed in the mind of the king by the violent and undutiful expressions uttered by Coligni in the royal presence; that having but the interval of a few hours to deliberate, he had hastily given permission to the duke of Guise and his friends to execute justice on his and their friends; and that if, from the excited passions of the populace, some innocent persons had perished with the guilty, it has been done contrary to his intention, and has given him the most heartfelt sorrow." The balance of evidence evinces that the original plan, formed by Catharine de' Medici and the duke of Guise, was simply to disorganize the Huguenot party by the murder of Coligni, their recognized leader; that the partial failure of this threw the court into alarm, and the weak king, persuaded that his person was in danger, consented to issue the order for the massacre, which, as expressed by Lingard, "was not originally contemplated, but grew out of the unexpected failure of the attempt already made upon the life of the admiral."—A grave question has arisen as to the supposed complicity of the papal court in the massacre. The despatches of the papal nuncio at Paris seem to set this question at rest. On the very day of the massacre he wrote to the cardinal secretary at Rome an account of the matter. A month later (Sept. 22), in reply to inquiries for more detailed information, he wrote: "The queen regent, having become jealous of the admiral, came to the resolution a few days before, and caused the arquebuse to be discharged at him without the knowledge of the king, but with the participation of the duke of Anjou, and of the duchess of Nemours, and of her son the duke of Guise. Had he died immediately, no one else would have perished. But he did not die, and they began to expect some great evil; wherefore, closeting themselves in consultation with the king, they determined to throw shame aside, and to cause him to be assassinated with the others; a determination which was carried into execution that very night." This account was contained in a cipher despatch from the nuncio at Paris to the government at Rome, which would hardly have asked information about a conspiracy in which they had borne a part; and the nuncio, in a secret despatch, would hardly have spoken in terms of such condemnation of a plot in which his superiors were implicated. These secret despatches were first published almost two centuries after. A solemn *Te Deum* over the event was sung at Rome by the order of Pope Gregory XIII.; but it must be borne in mind that, according to the accounts then at hand, the affair grew out of an unsuccessful conspiracy against the French government and the Catholic church;

and the *Te Deum* belonged to the same category with the one sung shortly before for the victory gained at Lepanto over the Turks.—Nuthdorf, a German student who professed to have been an eye witness of the massacre, left a narrative of it in Latin, which has been recently discovered in France, and is said to be in course of publication (1872).

BARTLETT, Elsha, an American physician and author, born in Smithfield, R. I., in 1805, died there, July 18, 1855. He graduated from the medical department of Brown university in 1826, spent a year in Europe, and commenced practice in Lowell, Mass. He delivered the course of lectures on pathological anatomy at the Berkshire medical institute in Pittsfield, Mass., in 1832, and in 1839 lectured at Dartmouth college. Subsequently he held professorships in Transylvania college, Lexington, Ky. (1841), the university of Maryland (1844), Lexington again (1846), Louisville (1849), and the university of New York (1850); and from 1851 till his death he held the chair of materia medica and medical jurisprudence in the college of physicians and surgeons in New York. While occupied in these different situations during the autumn and winter, he also delivered from 1848 to 1852 the lectures at the Vermont medical college, Woodstock, in the spring and summer. He wrote "Essay on Philosophy of Medical Science" (1844); "Inquiry into the Degree of Certainty in Medicine" (1848); "The Fevers of the United States" (1850); "Discourse on the Times, Character, and Works of Hippocrates" (1852); and a volume of verses entitled "Simple Settings in Verse for Portraits and Pictures from Mr. Dickens's Gallery" (1855); and edited "The Monthly Journal of Medical Literature" at Lowell.

BARTLETT, Ichabod, an American lawyer, born in Salisbury, N. H., in 1786, died in Portsmouth, N. H., Oct. 19, 1853. He was educated at Dartmouth college, and commenced the practice of law in Durham, but soon removed to Portsmouth, where he spent the rest of his life. He is celebrated as an opponent of Webster and Mason. He was seven years in the state legislature, a representative in congress (1823-'9), and a member of the state constitutional convention of 1850.

BARTLETT, John Russell, an American author, born in Providence, R. I., Oct. 23, 1805. He was early placed in a banking house, and was for six years cashier of the Globe bank at Providence. While there he was one of the original projectors of the Providence athenæum and an active member of the Franklin society, before which he occasionally lectured. In 1837 he engaged in business in a commission house in New York, in which he was unsuccessful. He then took part in establishing there the bookstore of Bartlett and Welford, chiefly for the importation of foreign works. He became at this time one of the active managers of the New York historical society, and was a projector of the American ethno-

logical society. In 1850 he was appointed by President Taylor commissioner to fix the boundary line between the United States and Mexico under the treaty of Guadalupe Hidalgo. He remained in this service till Jan. 7, 1853, making extensive surveys and explorations, with elaborate scientific observations; but, for want of the necessary appropriations, the boundary line was not completed by him. In 1854 he published a "Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora, and Chihuahua." He had previously published a small work on "The Progress of Ethnology" (1847), and a "Dictionary of Americanisms" (1850), since revised and enlarged (1859). He became secretary of state of Rhode Island, May 1, 1855, and has held that office ever since. He has edited and published the "Records of the Colony of Rhode Island and Providence Plantations" (10 vols., 1856-'65), and written "Bibliography of Rhode Island" (1864), "Index to the Acts and Resolves of the General Assembly of Rhode Island from 1758 to 1862" (1863), "Literature of the Rebellion" (1866), "Memoirs of Rhode Island Officers in the War of the Rebellion" (1867), "Primeval Man" (1868).

BARTLETT, Joseph, an American wit, poet, and adventurer, born in Plymouth, Mass., about 1763, died in Boston, Oct. 27, 1827. He graduated at Harvard college in 1782, and began the study of law at Salem, but soon gave it up for a voyage to England. In London, being at the representation of one of Gen. Burgoyne's plays in ridicule of his countrymen, he stood up in the pit and cried out, "Hurrah! Great Britain beaten by barbers, tailors, and tinkers!" with prodigious effect. It was taken in good part, and got him the acquaintance of many of the "bloods" of the day. He gambled, got into prison, wrote a play for his release, and went upon the stage himself. From an actor he became a merchant, and, having sailed for America with a large supply of goods on credit, was shipwrecked on Cape Cod. For a while he figured as captain of volunteers in Shays's war, then opened an office in Woburn, painting it black, and calling it the "Coffin," to attract notoriety. He next removed to Cambridge, and in 1799 delivered a poem on physiognomy before the Phi Beta Kappa society, satirical and clever, and said to touch upon the traits of individuals at the time. To the edition of this poem published in 1823 were appended a number of "Aphorisms on Men, Principles, and Things," the results of his various experience. The same year he delivered a Fourth of July oration at Boston, and afterward recited a poem entitled "The New Vicar of Bray," which obtained considerable celebrity. He attempted the practice of law and of politics in Maine, was elected to the state legislature, and nearly secured an election to congress. He then practised law at Portsmouth, N. H., and closed his improvident life, a burden to his friends, at Boston.

BARTLETT, Josiah, M. D., an American patriot and statesman, born at Amesbury, Mass., in November, 1729, died May 19, 1795. He commenced the practice of medicine in 1750 at Kingston, and established a reputation during the prevalence of the *angina maligna* in 1754 by treatment with Peruvian bark, in opposition to the usage of other physicians. He received several appointments from the royal governor, John Wentworth, but was deprived of them in 1775 for being a zealous whig. In 1774 he was appointed to the command of a regiment of militia. Being chosen delegate to the continental congress, he was the first who voted for, and the first after the president who signed the Declaration of Independence. He accompanied Stark in 1777 to Bennington. In 1779 he was appointed chief justice of the common pleas, in 1784 justice of the supreme court, and in 1788 chief justice. He was an active member of the convention called to adopt the federal constitution in 1788. In 1790 he was president of New Hampshire, and in 1798 was chosen the first governor under the new state constitution.

BARTLETT, William, one of the founders of the theological seminary at Andover, Mass., born at Newburyport, Jan. 31, 1748, died there, Feb. 8, 1841. He made a large fortune in trade, and besides liberal contributions in aid of the temperance reform, foreign missions, and the education of young men for the ministry, he gave \$30,000 toward the foundation of the Andover theological seminary, endowed a professorship, and built a house for the incumbent.

BARTLETT, William Henry, an English artist and author, born in London, March 26, 1812, died at sea in September, 1854. He was apprenticed to John Britton the antiquary, and employed by him as a draughtsman. He travelled extensively at home and abroad, repeatedly visiting the East and the American continent, and engraved nearly 1,000 plates from his drawings, with descriptions written by himself, by his fellow traveller William Beattie, and by other hands. The text of his "Beauties of the Bosphorus" (London, 1840) was furnished by Miss Pardoe, and that of "American Scenery" (3 vols., 1840) and of "Scenery and Antiquities of Ireland" (2 vols., 1842) by N. P. Willis. His works on Switzerland, Egypt, and the Holy Land were the most popular, a 4th vol. of his "Footsteps of our Lord and his Apostles" appearing in 1856. A brief memoir of his life, by Beattie, was published in London in 1855.

BARTOL, Cyrus Augustus, an American author and Congregational clergyman, born at Freeport, Me., April 30, 1813. He graduated at Bowdoin college in 1832, completed his theological education at the Cambridge divinity school in 1835, and was settled as colleague pastor with the Rev. Charles Lowell, D. D., of the West church in Boston, March 1, 1837. His principal writings are: "Discourses on the Christian Spirit and Life" (1850); "Discourses on the Christian Body and Form" (1854); "Pictures of Europe" (1855), a work combining

graphic sketches of travel with philosophical reflections; a history of the "West Church and its Ministers;" "Church and Congregation: a Plea for their Unity" (1858); "Word of the Spirit to the Church;" and "Radical Problem" (1872). He has also published a variety of occasional and miscellaneous discourses and essays, besides numerous contributions to the leading periodicals of the day, and several poetical compositions. His writings are characterized by a remarkable individuality of thought and illustration, and a certain antique quaintness of style. Although of a deeply religious tone, they give more prominence to the ethical and social element than to theological doctrine.

BARTOLI, Daniele, an Italian author, born in Ferrara, Feb. 12, 1808, died in Rome, Jan. 13, 1885. He entered the society of Jesus at the age of 15, and was sent to Rome in 1850 to write the history of the order, and in 1871 was appointed rector of the Roman college. His *Istoria della compagnia di Gesù* (5 vols. fol., Rome, 1853-'63; 12 vols., Turin, 1825) is in five parts, three relating to the East, including China, Japan, and Mongolia, one to Italy, and one to England, chiefly in the times of Elizabeth and James I. He wrote also *Vita e Istituto di S. Ignazio* (1689), which has been widely circulated in English; and *L'Uomo di lettere*, also translated into English.

BARTOLI, Pietro Santi, known also as **PERUGIO**, an Italian engraver, born about 1635, died in Rome in 1700. He was a pupil of Nicolas Poussin, and imitated his master's works with wonderful fidelity. He excelled chiefly as an engraver, his prints of Greek and Roman works being much valued by Winckelmann. His most celebrated designs are after the Scriptural frescoes of Raphael in the Vatican. His St. John, after Mola, is in the Louvre, and his "Jupiter crushing the Giants," after Giulio Romano, is at Mantua. He completed over 1,000 plates, chiefly etchings, which have become very scarce.

BARTOLINI, Lorenzo, an Italian sculptor, born at Savignano, near Prato, Tuscany, in 1777, died in Florence, Jan. 20, 1850. He took lessons from a French artist in Florence, and went to Paris in 1797, where his bass relief of "Cleobis and Biton" won a prize from the academy. He became a great favorite of Napoleon, who charged him in 1808 with the establishment of an academy at Carrara, from which city he was expelled after the overthrow of the emperor, whom he accompanied to Elba. After the battle of Waterloo he returned to Florence, where he directed the department of sculpture, and was professor in the academy of fine arts. He was regarded in Italy as next to Canova in eminence. He excelled especially by his graceful drapery, and by his exquisite modelling of the flesh. In the Pitti palace at Florence is his masterwork, a marble group representing Charity. Among his numerous other works in that city are statues of the Venus de' Medici and of Machiavelli.

At Milan is his statue of "Faith in God," erected by the marchioness Trivulzio in commemoration of her husband; in the cathedral of Lausanne is his monument of Lady Harriet Stratford Canning; and his Bacchante is in the duke of Devonshire's collection in England. In Paris he made busts of Madame de Staël, Lord Byron, the countess Guiccioli, Thiers, and many other prominent persons, besides the monument of Prince Nicholas Demidoff and the marble statues of Arnina, nymph of the Arno (1841), and of "The Nymph with the Scorpion" (1845).

BARTOLO, or Bartoli. I. Taddeo di, an Italian painter of the Siennese school, flourished from 1390 to 1414. He was the son and grandson of painters. Some of his pictures are at Pisa, Volterra, and Padua, and one of his celebrated madonnas is in the gallery of the late king Louis I. of Bavaria. His most remarkable fresco painting, in the vestibule of the chapel of the Palazzo Pubblico at Siena, representing celebrated men of antiquity, was imitated by Perugia in the exchange at Perugia. **II. Domenico di**, nephew and pupil of the preceding, was a painter of frescoes (1440), from which Raphael while at Siena derived a knowledge of national costumes. His "Ascension of the Virgin" is in the museum of Berlin.

BARTOLOMMEO, Fra, an Italian painter, whose real name was **BACCIO DELLA PORTA**, called also **il Frate** and **Fra Bartolommeo di San Marco**, born at Savignano in 1469, died in Florence, Oct. 8, 1517. He studied under Cosimo Rosselli, and acquired his knowledge of chiaroscuro from Leonardo da Vinci. His first works were of small size, such as his two cabinet pictures in the Florentine gallery, representing the "Nativity" and the "Circumcision." In his fresco of the "Last Judgment," in the chapel of Santa Maria Nuova, he adopted a grander style. He was an admirer and friend of Savonarola, whose execution preyed so much upon his mind that in July, 1500, he entered the convent of Prato, and subsequently that of San Marco. But he resumed his profession in 1504, and became intimate with Raphael, whom he instructed in coloring and the folding of draperies, while Raphael taught him the rules of perspective. Subsequently he went to Rome, to study the works of that master and of Michael Angelo. In the convent of San Marco are some of Fra Bartolommeo's most finished frescoes. One of his finest productions, "The Virgin upon a Throne," is in the public gallery of Florence. In the Pitti palace is his single figure of St. Mark, which is described by Winckelmann as a Grecian statue transformed into a picture. In the Quirinal of Rome are two of his pictures, St. Peter and St. Paul. The latter was most admired by Raphael, who completed it. Other famous works of his are to be found in Rome, Naples, Munich, Berlin, and St. Petersburg; and those removed by Napoleon I. to the Louvre have been restored to Florence. His rarest per-

formances are in the possession of the former grand ducal family of Tuscany, including his last and one of his best works, a large picture in chiaroscuro representing the patron saints of the city surrounding the Virgin. His designs came into possession of Sir Benjamin West, and afterward into that of Sir Thomas Lawrence, at whose death they were sold and scattered. He was the inventor of a new method of casting draperies, and of the use of the wooden figure with movable joints. The distribution of light and shadow constitutes the great merit of his art.

BARTOLOZZI, Francesco, an Italian engraver, born in Florence in 1725 or 1730, died in Lisbon about 1815. He was the son of a goldsmith, perfected himself in his art in Venice, Florence, and Milan, and in 1764 accompanied Richard Dalton, librarian of George III., to England, where he was employed in the royal academy, and acquired great celebrity, especially by his "Death of Otham" after Copley, and by his "Virgin and Child" after Sassoferrato. In 1805 he was called to Lisbon by the prince regent of Portugal, who pensioned him and made him president of the academy of fine arts. He excelled in every species of engraving, and left a prodigious number of plates and etchings; that of Clythia after Annibale Carracci is one of his master-works, and other designs after the Carracci, the "Death of Dido" after Cipriani, and the "Massacre of the Innocents" after Guido, are among his more renowned productions. With Bracci he wrote *Memorie degli antichi incisori* (2 vols., Florence, 1784-'8).

BARTON. I. A S. W. county of Missouri, on the Kansas border, watered by affluents of the Grand or Neosho and of the Osage river; area, 600 sq. m.; pop. in 1870, 5,087, of whom 19 were colored. The chief productions in 1870 were 21,436 bushels of wheat, 245,460 of Indian corn, 38,847 of oats, and 7,459 tons of hay. There were 1,983 horses, 1,755 milch cows, 8,237 other cattle, 8,337 sheep, and 6,794 swine. Capital, Lamar. II. A W. central county of Kansas; area, 900 sq. m.; pop. in 1870, 2. The Arkansas river intersects the S. portion, and its branches, the chief of which is Walnut creek, water the greater part of the county. Fort Zarah is in this county, at the junction of Walnut creek with the Arkansas.

BARTON, Benjamin Smith, an American naturalist, born at Lancaster, Penn., Feb. 10, 1766, died in Philadelphia, Dec. 19, 1815. He was a son of the Rev. Thomas Barton and a nephew of Dr. David Rittenhouse. After his parents' death, and after a course of general studies at York, Penn., under Dr. Andrews, he studied medicine and the natural sciences in Philadelphia (1782-'6), and in Edinburgh and London (1786-'8), and took his medical degree in Göttingen in 1788 or 1789. Subsequently he practised his profession in Philadelphia, and became professor of botany and natural history, retaining this position after the incorporation of the college with the university in 1791. He

received the chair of materia medica in 1796, and succeeded Dr. Rush in that of the theory and practice of medicine. He was president of the Philadelphia medical society, vice president of the American philosophical society, a member of many other American and European societies, and a correspondent of Humboldt and other savants. Among his works are: "Elements of Botany" (2d ed., 2 vols., 1812-'14); "Collections for an Essay toward a Materia Medica of the United States" (3d ed., 1810); *Flora Virginica* (1812); and numerous other writings, chiefly relating to natural history, and on medical, philological, and archaeological subjects.—His nephew, **WILLIAM P. C. BARTON**, M. D., succeeded him in the chair of botany, and died in 1856. He wrote "Memoirs" of his uncle, "Flora of America" (3 vols., 1821-'3), "Vegetable Materia Medica of the United States, or Medical Botany" (illustrated, 1817-'25), and other works.

BARTON, Bernard, an English poet, born in London, Jan. 31, 1784, died at Woodbridge, Feb. 19, 1849. He was a member of the society of Friends, and a bank clerk at Woodbridge from 1810 to 1847. His work entitled "Metrical Effusions" (1812) was followed by others, which, though deficient in poetical power, were animated with tender and devotional feeling, and gained for him the regard of Southey, Lamb, and Byron, and a donation of £1,200 from a reading club which he had established at Woodbridge, besides a pension of £100 accorded to him in the latter part of his life through Sir Robert Peel. His poems fill 8 or 9 volumes, the "Household Verses" being among his latest and best productions. His sister Maria Hack wrote many juvenile works, and his daughter Lucy published in 1849 "Selections from the Poems and Letters of Bernard Barton."

BARTON, Elizabeth, called the Holy Maid or the Nun of Kent, an English religious impostor, executed April 21, 1534. She was a servant, who when seized with nervous fits lay out in ravings, of which her parish priest, Masters, took advantage in 1525 to represent her as an inspired prophetess. In 1531 she was induced by Father Bocking to take the veil at Canterbury for the sake of additional effect, he prompting her to denounce the reformation, and especially Henry VIII. on account of his proposed divorce from Queen Catharine. Even Sir Thomas More and Bishop Fisher of Rochester countenanced the imposture for a time, and the excitement among the populace became so obnoxious to the authorities that she was arrested in 1533. She made a confession of the conspiracy at St. Paul's cross in December. A bill of attainder against her and her accomplices including Masters, Bocking, Deering (who wrote a work on her revelations and prophecies), and two other persons, was passed on March 6, and she was beheaded with them at Tyburn.

BARTON, William, an American soldier, born in Providence, R. I., about 1747, died there

Oct. 22, 1831. He was a lieutenant colonel in the state militia when, on the night of July 20, 1777, he crossed Narragansett bay with a small body of men, passed unnoticed three British frigates, landed between Newport and Bristol ferry, reached the house where the English general Prescott was sleeping, and with the assistance of a negro, who broke in a panel of the door with his head, made his way into the room and took him prisoner. For this exploit he received from congress the gift of a sword, a commission as colonel, and a tract of land in Vermont. He retired from active service in August, 1778, after having been wounded at Bristol ferry, and was a member of the convention which adopted the constitution. By some illegality in the transfer of a portion of his Vermont land Barton was involved in difficulties, and for several years imprisoned for debt in Vermont till 1825, when Lafayette paid the claim against him. Mrs. O. M. Williams included a life of Barton in her "Biography of Revolutionary Heroes" (Providence, 1839).

BARTOW, a N. W. county of Georgia, formerly called Cass; area, 714 sq. m.; pop. in 1870, 16,566, of whom 4,719 were colored. Gold, copper, lead, iron, plumbago, marble, and limestone are found in several places. The surface is much diversified, and occupied in part by forests of hickory, pine, elm, and other trees. The Western and Atlantic railroad traverses the county, and it is drained by Etowah river and its branches. The chief productions in 1870 were 136,647 bushels of wheat, 239,197 of Indian corn, 36,284 of oats, and 2,833 bales of cotton. There were 1,045 horses, 1,682 milch cows, 2,552 other cattle, 4,100 sheep, and 11,794 swine. Capital, Cartersville.

BARTRAM, I. John, an American botanist, born at Marple, Delaware county, Penn., in 1701, died in September, 1777. His grandfather was one of the companions of William Penn. He himself supported a large family by his industry as a farmer; but by unremitting application he mastered the rudiments of the learned languages, and made such proficiency in botany that he was pronounced by Linnaeus the greatest natural botanist in the world. He made excursions through many regions of North America at a time when they were covered with forests, and he was the first to describe particularly their natural productions. In 1743 he visited the shores of Lake Ontario, and in 1765 explored the region of the river St. John's in Florida; and in both of these excursions he collected many beautiful plants and trees, which he sent to enrich the gardens of Europe. He was supplied by Linnaeus, Sir Hans Sloane, and others, with books and apparatus, and he in return sent them specimens of new and curious American plants. He founded on the bank of the Schuylkill, a few miles below Philadelphia, the first botanic garden in America, where he cultivated beautiful and rare American and exotic plants. At the

time of his death he was a fellow of several foreign learned societies, and bore the title of American botanist to George III. of England. He published an account of his observations during his travels, and contributed to the British "Philosophical Transactions" several papers on scientific subjects. See "Memorials of John Bartram and Humphrey Marshall," by Dr. William Darlington (Philadelphia, 1849). **II. William**, son of the preceding, born at Kingessing, Penn., in 1739, died July 22, 1823. He commenced life as a merchant, but accompanied his father to East Florida and settled on the banks of the river St. John's. In 1771 he returned to Kingessing, but in 1773, at the request of Dr. Fothergill of London, he made a second scientific journey to Florida, and also to the Carolinas and Georgia. The narrative of his expedition, under the title of "Travels through North and South Carolina, East and West Florida, the Cherokee Country, &c.," was published in Philadelphia in 1791, and in London in 1792, and again in 1794 with illustrations (French translation by P. V. Benoist, 2 vols., Paris, 1801). One of his essays, written in 1789, was published in 1853, in vol. iii. of the "Transactions of the American Ethnological Society," under the title of "Observations on the Creek and Cherokee Indians." In 1782 he declined the chair of botany in the university of Pennsylvania, on account of his impaired sight. He made known and illustrated many of the most curious and beautiful plants of North America, and published the fullest list of American birds previous to Wilson, whom he greatly assisted at the outset of his labors.

BARTSCH, Johann Adam Bernhard von, a German engraver, born in Vienna, Aug. 17, 1757, died there, Aug. 21, 1821. He rose to the highest eminence in his art, and became a member of the academy of fine arts and director of the imperial collection of engravings. He wrote *Le peintre-graveur* (21 vols., Vienna, 1802-'21), one of the best accounts of prints ever published; and *Catalogues raisonnés* of the works of Rembrandt (2 vols., 1797) and other great artists. The catalogue of his own productions, comprising over 500 prints, was published in 1818 by his son FRIEDRICH JOSEPH ADAM VON BARTSCH, born July 12, 1793, who succeeded him as director.

BARTSCH, Karl Friedrich, a German philologist, born at Sprottau, Feb. 25, 1832. He graduated at Halle in 1853, was director of the library of the German museum at Nuremberg 1855-'7, and professor at Rostock 1858-'71, when he succeeded Holtzmann in Heidelberg. He has written much on ancient German and French literature, and translated Burns into German (1865). Among his principal works are his critical edition of the *Nibelungenlied* (Leipsic, 1870) and his *Grundriss zur Geschichte der Provenzalischen Literatur* (1872). He has edited the *Germania* since 1869.

BARUCH (Heb., blessed), the son of Neriah, a friend and amanuensis of the prophet Jer-

miah, whose captivity he appears to have shared, and whom he accompanied to Egypt. His subsequent fate is unknown. He wrote from dictation the prophecies of Jeremiah, and read them to the people from a window of the temple (about 605 B. C.); but King Jehoiakim, being displeased with the contents, destroyed the roll, cutting it with a penknife and afterward burning it. Concealing themselves from the persecutions of the king, Baruch and Jeremiah rewrote the whole of the prophecies. The enemies of Jeremiah ascribed to the latter an important influence upon the prophet. Bunsen regards Baruch as the author of the second part of Isaiah.—One of the apocryphal books of the Old Testament bears the name of Baruch. It follows in the Septuagint immediately after the prophecy of Jeremiah. The prologue of the book states that it was read by Baruch to Jeremiah and the people in Babylon by the river Sud (Euphrates); that the people were brought by it to repentance, and sent the book with a letter and presents to Jerusalem. Then follows an exhortation to wisdom and a due observance of the law. Jerusalem is introduced as a widow comforting her children with the hope of a return. The Roman Catholic theologians generally defend the authenticity of the book, while most of the Protestants regard its spuriousness as fully proved. The first portion of the book, embracing chap. i. to iii. 8, is, according to the unanimous opinion of all writers, a translation from a Hebrew original; according to Ewald and Hitzig, the translation was made by the Alexandrine translator of Jeremiah. The remainder is believed to have been written by a Greek author. Ewald thinks it was composed between 360 and 350 B. C.

BARY, Hendrik, a Dutch engraver of the 17th century. His productions are remarkable for neatness of execution, though inferior to those of Cornelius Vischer. Among them are excellent engravings of the portrait of Grotius, of several Dutch admirals, and of an allegorical picture by Vandyke, representing "Summer and Autumn."

BARYE, Antoine Louis, a French sculptor, born in Paris, Sept. 24, 1795. He perfected his studies under Bosio and Gros, and acquired reputation in 1831 by his group representing a tiger and a crocodile, in M. Thiers' possession. In 1848-'51 he held an office in the Louvre museum, where he also had his studio. In 1850 he became a teacher of the art of designing subjects in natural history at Versailles, and afterward taught in the Louvre from 1854, and in the museum of the botanical garden from 1856. He executed allegorical statues for the pavilion of the new Louvre; produced many works relating to mythological and historical subjects; statuettes of Gaston de Foix, Napoleon, and Charles VI. (the last executed after his model by the late princess Marie d'Orléans); the "Three Graces," the "Amazon," "Angelica," two of his daughters (since dead), and other fine female figures. His

works most admired for their anatomical and physiological qualities and monumental grandeur are his bronze groups of animals, as his lion crushing a boar, and his other lions in the garden of the Tuileries; his panther and gazelle in the collection of the duke de Luynes; his little bears playing; his tiger devouring a goat in the Lyons museum; and his jaguar feasting upon a hare, purchased as a plaster model by the French government in 1850, and exhibited in bronze at the Paris expositions of 1852 and 1855. In 1833 he became chevalier and in 1855 officer of the legion of honor; received the gold medal of honor at the exhibition of 1855; took a prominent part in the London exhibition of 1862; and in 1868 became a member of the academy of fine arts. Gonon's revival of the renaissance method of modelling bronze statues at the first casting from waste wax (*cire perdue*) is successfully applied to many of Barye's works.

BARYTA, or **Barytes**. See **BARITUM**.

BAS, or **Batz**, a small island of France, in the English channel, a part of the department of Finistère, 15 m. N. W. of Morlaix, about 2½ m. long and nearly 2 m. wide; pop. about 5,000. It contains three villages, four batteries, two forts, a revolving lighthouse, and a safe harbor of refuge.

BASALT, the hardest, most compact, and heaviest of the trap rocks, frequently columnar in structure, the columns or prisms having three, five, or more sides, regular and jointed. Some of the columns of the isle of Skye are 400 feet long, while in other localities they do not exceed an inch in length. The diameters of the prisms range from nine feet to an inch across the face. The columnar structure is most noticeable when the rock is viewed at a distance, as at the Palisades on the Hudson. Remarkable examples of basalt have been found on the N. W. shore of Lake Superior, at the Giant's Causeway, Ireland, and Fingal's cave, Scotland, and on the island of St. Helena. Basalt belongs to the augitic series of the igneous rocks resembling dolerite, and consists of labradorite, augite, and chrysotile in grains looking like green glass. Its specific gravity varies from 2.9 to 3.2. Owing to its hardness, basalt has been much used for pavements and for macadamizing roads. When melted and cooled rapidly it is converted into a kind of obsidian (volcanic glass), and can be cast into ornamental blocks and mouldings. Artificial building stone was at one time made of it in England.

BASARJIK (Turkish, market town), the name of several places in European Turkey, the most important of which are the two following. **I.** Also called Hadji-Oglo-Basari, in eastern Bulgaria, 25 m. N. of Varna; pop. about 5,000, mostly Mohammedans. The town contains 10 mosques, and has an important yearly fair in April. It was captured by the Russians, June 2, 1774, and again June 3, 1810, after an obstinate struggle in which 8,000 Turks fell. **II.** Also called Tatar-Basarjik, on the upper

Maritza, in the eyalet of Adrianople, 20 m. W. N. W. of Philippopolis. It contains 4,000 or 5,000 houses, about three fourths of which are occupied by Mohammedans and one fourth by Bulgarian Christians. The town has 18 mosques, 5 churches, and a yearly fair lasting from the beginning of June to the middle of August. Rice culture and the trade in that article are important branches of industry. There are also warm springs and baths.

BASCHI, Matteo, an Italian Franciscan, founder of the Capuchins, died in Venice in 1552. He was a Minorite friar of the convent of Montefalco, when he declared that St. Francis had appeared to him in a vision, and commanded him to introduce into the order the same costume which the saint had worn in life, namely, a robe of flannel, of a chestnut color, tied with a cord for a girdle, a short flannel cloak, and a large hood. Pope Clement VII. accepted the revelation, and gave Baschi and those who wished to imitate him permission to form a separate congregation, which soon took the name of Capuchins (*capote*, a hood). Baschi met with much opposition from his brethren, and was for a short time imprisoned; but he finally became the first general of the Capuchin branch of the Franciscans.

BASCOM, Henry Bidleman, D. D., LL. D., an American clergyman, bishop of the Methodist Episcopal church South, born May 27, 1796, in Hancock, Delaware co., N. Y., died in Louisville, Sept. 8, 1850. Before the age of 18 he received license to preach, and was admitted to the Ohio conference. After several years of hard work on frontier circuits, he was transferred to the Tennessee conference in 1816, returned to the Ohio conference in 1822, and in 1823, through the influence of Henry Clay, was elected chaplain of the house of representatives at Washington. In 1824 he was stationed at Pittsburgh, in 1825 was made conference missionary, and from 1827 to 1828 was president of Madison college, Uniontown, Penn. From 1829 to 1831 he served as agent of the colonization society, and then was appointed to the chair of moral science and belles-lettres in Augusta college, Kentucky, where he remained till 1841. He declined the presidency of Louisiana college and of the Missouri university to accept that of Transylvania college, Kentucky (1842). He was the author of the celebrated protest of the southern delegates to the general conference against the action of the majority in the case of Bishop Andrew (1844), was also a member of the convention of southern delegates held in Louisville, Ky., in May, 1845, and drew up the report of the committee on the organization of the church South. After serving as editor of the "Quarterly Review" of the M. E. church South (1846-'50), and chairman of the board of commissioners to settle the controversy between the northern and southern divisions of the church, he was elected to the episcopal office a short time before his death. His works (4 vols. 8vo, Nashville, 1850 and 1856)

comprise sermons, addresses, lectures, and essays on infidelity, mental and moral science, moral and political philosophy, &c., and "Methodism and Slavery," a defence of the southern branch of the church. As a pulpit orator, Dr. Bascom was singularly fervid and powerful, and the fame of his eloquence was scarcely surpassed by that of any other public speaker in church or state. His biography has been written by the Rev. M. M. Henkle (12mo, Nashville, 1854).

BASCOM, John, an American scholar and author, born at Genoa, N. Y., May 1, 1827. He is a graduate of Williams college and of Andover theological seminary, and has been since 1855 professor of rhetoric in the former institution. He has published a treatise on "Political Economy" (1861); "Treatise on Aesthetics" (1862); "Text Book of Rhetoric" (1865); "Elements of Psychology" (1869); and "Science, Philosophy, and Religion" (1871), a series of lectures delivered before the Lowell institute, Boston, in the winter of 1869-'70.

BASE, in chemistry, a term used with several applications, varying according to the view taken of the constitution of compounds. As originally used in the exposition of the dualistic hypothesis, it signified the electro-positive oxide, sulphide, &c.; but in the new unitary hypothesis it must be applied to those electro-positive elements or compound radicals which can be substituted for the hydrogen of acids. Alkalies and some other metallic oxides were formerly regarded as comprising all the strictly defined bases; but to these are now added a large class of organic substances existing in plants, which with acids form salts, and may be separated by the greater affinity of the acid for stronger bases. These vegetable bases or alkaloids consist of oxygen, hydrogen, and carbon, in combination with a certain proportion of nitrogen. The constant presence of this element has led to the supposition that the salifiable properties of these compounds may be attributed to it. The vegetable bases are usually in white crystals. The few animal bases or alkalies are volatile, liquid, and of oily consistency. The medicinal properties of plants reside in the bases extracted from them. A crystal of aconitine contains the concentrated strength of numerous plants of the monkshood; and one of morphia combines that of a large quantity of opium, as one of quinine does of Peruvian bark. (See **ALKALI**, **ALKALOID**, and **SALT**.)

BASE BALL, an athletic game played in the United States, where it has, as a national amusement, a prominence almost equal to that attained by cricket in England. It has reached its present importance only within the last 10 or 15 years, though it was long before played in some parts of the country, and is indeed probably derived from an old English game called "rounders." It is played with a hard ball, composed of yarn tightly wound around a piece of vulcanized rubber, and a round wooden bat not more than 42 inches in length.

The ball must not weigh less than 5 nor more than 5½ ounces avoirdupois, and must be between 9 and 9½ inches in circumference. The bat must not be more than 2½ inches in diameter in the thickest part.—A base ball ground should be a level area of fine turf about 600 ft. in length by 400 ft. in breadth, at one end of which a square of 90 ft. is marked out. At the lower angle of this, designated as the home base, is fixed a white iron plate or stone, while the other angles are indicated by white canvas bags filled with sawdust and attached to posts, or more commonly iron pins, sunk in the ground. Nine players constitute a side, one side taking the bat and the other the field. The batsman stands at the home base, having the pitcher opposite to him, at the distance of 45 ft., and the catcher behind. A player is also stationed at or near each of the three canvas bags, known as the first, second, and third

bases, and which are respectively on the right, opposite to, and on the left of the batsman. Besides these, there is a short field, called the short stop, behind the pitcher, and a right, centre, and left field at a considerable distance in the rear of the second base, the duties of all of whom are to catch or stop the balls and return them to the pitcher or the basemen. The positions of the players as well as those of the bases will be understood by reference to the annexed diagram. A captain, who is generally the catcher, assigns the places of the players on his side and directs the game. One or two definitions must precede a description of the actual game. The batsman may strike a ball in two ways, "fair" and "foul." It is a fair ball when it is struck in a direction lying within the lines of range of the home and third base, or of the home and first base—supposing those lines indefinitely continued in the direction of the field—and when it first touches the ground, a player, or any object within those lines. It is a foul ball when struck outside those limits, either to the right, left, or

rear of the batsman.—The actual form of play is as follows: When the batsman has struck a fair ball, or when he has struck three times at any fairly delivered ball and missed it each time, he must start for the first base; from which it is his object to reach in turn, as he has opportunity, the second, third, and again the "home." When he succeeds in reaching the home base without being put out, and after having successively touched the first, second, and third bases, he is entitled to score one run. As soon as each batsman begins to run the bases, he is succeeded at the bat by another player of his own side, the succession continuing until three players of the side are out, when the side goes to the field, and their adversaries take their innings. A player may be put out in the following different ways: 1, if while he is acting as batsman a fair ball struck by him be caught by an adversary before it touches the ground; 2, when a foul ball struck by him is either so caught, or caught on the first bound; 3, if a fair ball struck by him is held by his adversary on the first base before he reaches that base; 4, if he strikes three times at fairly delivered balls, misses each time, and each time the ball is caught by the catcher, or if, after so striking, the ball is held by the player on first base before he can reach it; 5, if while running the bases he is touched by the ball, while in play, in the hands of an adversary, at a time when no part of his person is touching any base; 6, if he wilfully breaks certain important rules concerning details of play, or attempts to frustrate by any improper means a legitimate attempt to put him out—by knocking the ball from the hand of a player, or in other ways. A ball is said to be out of play after a foul stroke, until it has been returned to the hands of the pitcher. Nine innings are played on each side, and the party making the greatest number of runs wins the game.—The rules observed throughout the country in playing the game are those agreed upon by the two national associations of base ball players—one of professional players, so called, and the other of amateurs. Representatives of the different clubs belonging to these meet annually in convention, revise the rules of play, settle contested points, &c.; and reference may be made to their code of regulations, printed in all base ball players' manuals, for further information concerning the details of the game.

BASEDOW, Johann Bernhard, a German reformer of education, born in Hamburg in September, 1728, died in Magdeburg, July 25, 1790. He was the son of a wig maker, and a pupil in the Hamburg gymnasium, where he was encouraged in his studies by Reimarus. Subsequently he spent several years at the university of Leipsic and became a professor. Rousseau's *Emile* having produced a strong impression upon his mind, he came forward in 1768 in favor of a thorough reform in education, and received assistance for the publication of his *Elementarwerk* (8 vols., 1774; translated

into French and Latin), with 100 of Chodowiecki's plates, illustrating natural sciences and industry. This became the model of many school books of the kind, imparting varied information in a cosmopolitan and liberal spirit. Under the auspices of Prince Francis Frederick of Anhalt-Dessau, he opened at Dessau in 1774 the *Philanthropin*, a school free from sectarian bias and from corporal punishment, and designed to deliver public instruction from mediæval bonds, to prepare pupils for higher academical studies without pedantry or bigotry, to introduce gymnastic exercises, and to impart a knowledge of modern as well as of ancient languages. This school led to the establishment of many similar ones, though Basedow himself withdrew from it in 1778. He was charged with not duly appreciating the advantages of a thorough classical and of an orthodox religious training; but he was nevertheless regarded as a most effective and philanthropic reformer.

BASEL (Fr. *Basle* or *Bâle*). I. A canton of Switzerland, which since 1833 has been divided into two half cantons, called Basel City and Basel Country (Ger. *Baselstadt* and *Baselland*); area of both, 176 sq. m.; pop. in 1870, 101,887. It is bounded by Alsace, Baden, and the cantons of Aargau, Solothurn, and Bern. The northern chains of the Jura here descend into the plains of the Rhine, which are about 700 ft. above the level of the sea, the highest elevation being 3,800 ft. The country is hilly but fertile, and the climate mild, the cold northern winds being intercepted by the mountains. The canton has no lakes; the Rhine is the only considerable river, though there are numerous small streams. Coal and salt are the only minerals. The agricultural products present but little variety. Cattle, hides, butter, cheese, and cherry brandy are exported. There are considerable manufactures of iron, copper, steel, silk, linen, leather, and paper; the dyeing and bleaching factories are noted.—The city half canton has an area of 14 sq. m.; pop. in 1870, 47,760, of whom 34,455 were Protestants, 12,301 Catholics, 516 Israelites, and 488 of other sects. It had in 1865 a revenue of 1,205,988 fr.; the expenditures were 1,529,373 fr.; the public debt was 5,987,885 fr., while the value of the public domain was estimated at 2,951,386 fr. The country half canton, the capital of which is Liestal, is divided into four districts; area, 162 sq. m.;

pop. in 1870, 54,127, of whom 43,528 were Protestants, 10,245 Catholics, 131 Israelites, and 228 of other sects. The yearly expenditure is about 550,000 fr.; the public debt in 1867 was 824,000 fr.; while the value of the property of the canton was estimated at 2,951,386 fr. The inhabitants of both half cantons are purely Teutonic, but generally speak a mixed Franco-German dialect. II. A city, the capital of the half canton of which it forms the largest part, situated on the Rhine, 43 m. N. N. E. of Bern; pop. in 1870, 44,884. It is divided into Great Basel on the S. and Little Basel on the N. bank of the river, connected by a wooden bridge 580 feet long. The city is surrounded by unimportant fortifications, and contains a cathedral, built on the spot where stood the Roman fortress of Basilia, a university, a public library containing paintings by Holbein, the hall where the council of Basel was held, and other public buildings, among which are many educa-

Basel.

tional institutions, toward the maintenance of which one-fifth of the public revenue is applied. Basel is the most important manufacturing and commercial town in Switzerland, and the wealth of its citizens is proverbial. The ribbon manufacture, which gives employment to about 3,000 persons, is the principal branch of industry. There were formerly extensive manufactures of paper and leather, but these have declined within a few years, and are nearly abandoned.—The city was founded by the Romans, by whom it was called Basilia or Basiliensia. It was destroyed in the wars between the Romans and Germans, and rebuilt in the early part of the 10th century by the German emperor Henry I., when it became the residence of a bishop, and belonged for some time to Burgundy, but after 1032 to the German empire. The territorial dominion belonged partly to an imperial bailiff, partly to

the bishop, whose see extended over other localities, and partly to nobles of the rural districts and to patrician families. The latter gradually became sole proprietors until they joined the Swiss confederation; the country nobility emigrated or were embodied among the patricians, and the bishop emigrated with his chapter to Solothurn, when after 1519 the city embraced with ardor the reformed faith. Thus the whole political sway was left with the patricians and trading corporations, who in time became omnipotent over the peasants, and reduced them and the poorer citizens to subjection, against which the latter often but in vain rebelled. The first French republic gave social equality to all classes, while a contribution of 11,000,000 francs was levied upon the city. The dissatisfaction with the restoration of the ancient prerogatives of the privileged city classes led in 1831 to several bloody battles between the soldiery of the city and the peasants, until the Swiss confederation intervened and in 1833 acknowledged the independence of the rural canton. At Basel was signed the treaty of peace between the French republic and Prussia, April 5, and that between the French republic and Spain, July 22, 1795. The population of the city, which was much larger in the middle ages, was in the middle of the 14th century greatly reduced by the "death of Basel," or "black death."

BASEL, Council of, one of the œcumenical councils of the Roman Catholic church. Properly speaking, the councils of Basel, Ferrara, and Florence constitute but one council, of which several sessions were held in each of these cities, and which is usually called the council of Florence, because the most important questions were definitely settled and the council terminated at this latter city. The council during its sessions at Basel, until its transfer to Ferrara in 1437, was acknowledged as œcumenical by Eugenius IV., and its decrees were confirmed by him, with the exception of those which interfered with the prerogatives of the holy see. The principal reasons for assembling a general council at the period referred to were to effect the reconciliation of the Greek church, and to reform ecclesiastical discipline. The council was summoned by Pope Martin V. to meet at Basel, March 3, 1431. Meanwhile he died, and Eugenius IV. was elected to succeed him on the very day of the indiction of the council, and immediately confirmed the acts of his predecessor convoking it. On the day appointed not a single bishop, and but one abbot, appeared at Basel. The last-mentioned person went through the form of declaring himself assembled in œcumenical council. Five days afterward four deputies, together with the first-named abbot and a few clergymen of the city, opened the council solemnly a second time. In September Cardinal Julian Cesarini, the papal legate, arrived at Basel, and sent letters to different

prelates exhorting them to come to the council. On Sept. 26 he held a session, at which it is said three bishops and seven abbots were present. The cardinal having sent an envoy to Rome to represent the state of things at Basel, Pope Eugenius IV., who desired to convoke the council in a place more convenient to the Greeks, sent a bull to his legate empowering him to dissolve the council and indicate a new one at Bologna. Cardinal Julian, who at first seemed disposed to dissolve the council, had however changed his mind, and was desirous to continue it. His principal reason appears to have been that he thought it would be a favorable opportunity for treating with the Hussites and reconciling them to the church. He himself had been lately in Bohemia on a legation from the holy see, and was more interested in this matter than in the affairs of the Greek church. This reason, however, made Eugenius still more desirous to transfer the council, as the affair of the Hussites had been once definitely settled at the council of Constance, and he did not wish it to be reopened. His legate, however, was determined if possible to continue the council at Basel; and when he had collected a sufficient number of prelates, the charge of provoking a schism deterred the pope from pressing violently his own wishes. But on Dec. 11, 1431, the pope published a bull dissolving the council of Basel. The cardinal legate obeyed, and declared that he could no longer act as president of the council. Nevertheless he exerted himself in the most energetic manner to induce the pope to revoke the bull, as did also the small number of prelates who were assembled. In these efforts they were supported by several sovereigns. After vainly endeavoring to effect an amicable transfer of the council, Eugenius IV. finally revoked his former bull, and on Feb. 14, 1433, published another, authorizing the continuance of the council at Basel. Meanwhile, however, the prelates had not ceased to continue their sessions, and to style themselves an œcumenical council, although the approbation of the pope was withdrawn from them, and the cardinal legate had ceased to preside. In this they justified themselves by the act of the council of Constance declaring its supremacy over the pope (1415); an act, however, which canonists regard as only intended to apply to contending claimants of the papacy, and as not synodical because the council was only recognized at the time by a part of the church. During the period of the suspension of the council by Eugenius IV., the prelates, who after a time increased to the number of 30, framed several decrees, declaring the superiority of a general council to the pope, the want of power in the latter to dissolve or transfer it, citing Eugenius to appear within a certain time, &c. After the revocation of the bull of transfer, all these edicts were revoked by the council, and the legitimate sessions recommenced under the presidency of

the legate. The declaration of the superiority of a general council to the pope was renewed, however, after the reconciliation, though the legate refused to be present, or sanction the act in any way. A number of decrees of reformation were framed, which are all the acts of the council ever recognized as truly synodical, and as such approved by the holy see. Great efforts were made to enter into negotiations with the Greek emperor, though without success. Finally, Eugenius IV., finding Cardinal Julian, the principal sovereigns, and the Greek emperor, altogether disposed to enter into his views, on June 19, 1437, dissolved once more the council of Basel, and transferred the sessions to Ferrara. There had been from the outset at Basel but few prelates and bishops of high rank, and a great number of the inferior clergy, all of whom had been admitted to a vote in violation of the canons. The cardinals and the principal portion of the prelates of rank obeyed immediately the mandate of the holy see, and repaired to Ferrara. The patriarch of Aquileia, the archbishops of Arles and Palermo, with a few other prelates, and several hundred priests, remained, and continued the sessions of their so-called council, from this time regarded as a *conciliabulum* or schismatical assembly. They declared several propositions respecting the superiority of general councils to be articles of faith, excommunicated the council of Ferrara, deposed the pope, and in 1439 elected Amadeus VIII., formerly duke of Savoy, who took the name of Felix V., and continued to bear it during 10 years, after which he abdicated it, and submitted himself to Nicholas V., who made him cardinal. The council of Basel continued its sessions during all this period, and finally the *débris* of the council, which had adjourned to Lausanne, put an end to itself by electing the reigning pontiff, Nicholas V., pope.

BASEVI, George, an English architect, born at Brighton in 1794, died at Ely, Oct. 16, 1845. He was a pupil of Sir John Soane, and travelled in Greece and Italy. In 1819 he commenced practice in London on his own account with great success. Belgrave square was erected from his designs. He was joint architect with Mr. Sidney Smirke of the conservative club house, St. James's street, a beautiful building. His best and greatest work, the Fitzwilliam museum at Cambridge, was finished by Mr. Cockerell. While inspecting the west bell tower of Ely cathedral, then being restored under his direction, he fell through an aperture a distance of 40 feet, and was killed.

BASHAN, in Biblical geography, the northern portion of trans-Jordanic Palestine, between Damascus Syria on the north and Gilead on the south. It is a high table land, and was anciently famous for the fertility of its soil, and for its oaks, which vied with the cedars of Lebanon. Remains of these forests are still seen in some of the mountainous districts. The deep, rich, black soil on the plains pro-

duces the same luxuriant pasture as in ancient times, and the flocks and herds reared there may still be called the fatlings of Bashan. It was conquered from the Amorites in the bloody battle of Edrei, where Og, the giant king of Bashan, fell. It was occupied by the nomadic half tribe of Manasseh. Later it was captured from Israel, after the revolt of the ten tribes, by Hazael, king of Syria, and afterward recaptured by Jeroboam II. It was also the first province that fell before the Assyrian invaders. When the Israelites were taken captive, the scattered remnants of the aboriginal inhabitants, who had settled among the rocky passes of Argob and Hermon, and in the desert, returned. Henceforth it is not mentioned under its name of Bashan by any writer, but the provinces into which it was divided are often referred to. Gaulanitis was the territory of Golan, the ancient Hebrew city of refuge. Auranitis is the Greek name of the Hauran of Ezekiel. Batanæa is the name given to the eastern mountain range, and occasionally used for Bashan in general; and Trachonitis, the rocky region of the north, is a Greek translation of the ancient Argob, the rocky. During the siege of Jerusalem by the Romans, the Christians living in that city retired to Pella, a town of Bashan; and in the 4th century nearly all the inhabitants of the country were Christians. Heathen temples were converted into churches, and churches were built in almost every town and village. When the Saracens overran Syria these churches were converted into mosques; and when the country fell into the power of the Ottomans its desolation was completed. The mountains of Bashan, though not generally very steep, are rugged and rocky. The remains of terraces are still to be seen on the slopes, which give evidence of past industry, and oaks and other forest trees and shrubs abound here. The whole mountain range is of volcanic origin; the peaks shoot up conically in deep serried lines, and the rocks are black. One or two craters of extinct volcanoes have been seen on the plain. The ancient province of Trachonitis, now Lejah, is a vast field of basalt in the midst of the plain of Bashan. In Argob, one of the provinces of Bashan, 30 m. long by 20 broad, Jair is said to have taken no fewer than 60 great and fenced cities. A late traveller, Cyril Graham, writes: "We find one after another great stone cities, walled and unwalled, with stone gates, and so crowded together that it becomes almost a matter of wonder how all the people could have lived in so small a place. When we see houses built of such huge and massive stones that no force which can be brought against them in that country could ever batter them down; when we find rooms in these houses so large and lofty that many of them would be considered fine rooms in a palace in Europe; and lastly, when we find some of these towns bearing the very names which cities in that country bore before the Israelites came out of Egypt, I think

we cannot help feeling the strongest conviction that we have before us the cities of the Rephaim of which we read in the book of Deuteronomy." Porter visited and passed by more than 30 cities and towns, and saw many others dotted over the plain. In his description of one of the houses of the aboriginal inhabitants he says: "The house seems to have undergone little change from the time that its old master left it, and yet the thick nitrous crust on the floor showed that it had not been inhabited for ages. The walls were perfect, built of large blocks of hewn basalt, without cement of any kind. The roof was formed of large slabs of the same black basalt, lying as regularly and joined as closely as if the workmen had just completed them. They measured 12 ft. in length, 18 inches in breadth, and 6 inches in thickness. The end rests on a plain stone cornice projecting about a foot from each side wall. The outer door was a slab of stone 4½ ft. high, 4 wide, and 8 inches thick. It hung upon pivots formed of projecting parts of the slab working in sockets in the lintel and threshold; and though so massive, it could be opened and shut with ease. At one end of the room was a small window with a stone shutter. An inner door, also of stone, but of finer workmanship, and not quite so heavy as the other, admitted to a chamber of the same size and appearance. From it a much larger door communicated with a third chamber, to which there was a descent by a flight of stone steps. This was a spacious hall, equal in width to the two rooms, and about 25 ft. long by 20 high. A semicircular arch was thrown across it, supporting the stone roof; and a gate so large that camels could pass in and out opened on the street. The gate was of stone and in its place." Some of these cities were supplied with water from distant springs by means of aqueducts. Desolation reigns everywhere; the cities are deserted, and the limited number of Druses and refugees who have settled there raise no more than is indispensable for sustenance, out of fear of arousing the rapacity of an arbitrary government and attracting the Bedouin robbers. (See BOZRAH.) The principal authorities on Bashan are J. L. Porter ("Damascus," "The Giant Cities of Bashan," &c.) and Wetzstein (*Reisebericht über Hauran und die Trachonen*, Berlin, 1860).

BASHAW. See PASHA.

BASHKIRS, or *Bashkarts*, uncivilized tribes of Russia, scattered from the Caspian to the boundary of Siberia, chiefly W. of the Ural mountains, and inhabiting large tracts of land (together about 50,000 sq. m.) in the governments of Perm, Ufa, Orenburg, Samara, and adjoining parts; total number about 500,000. They are of remote Finnish origin, but considerably mixed with Tartars, and have their local organizations of cantons, clanships, yurts, and villages, though they have been under Russian authority since their final subjugation about the middle of the 18th century. They are under

the ecclesiastical jurisdiction of the Mohammedan Tartar mufti of Ufa, and are nominally Sunnite Mohammedans, but addicted to paganism. They have many of the Tartar and Kirghiz characteristics, but although semi-savages, they are docile and inoffensive. About 50,000 of them are employed in the Russian cavalry service, and the whole race are relieved from paying taxes. They are excellent horsemen and eat horse flesh, and their horses, famous for endurance, are highly valued. In the war of 1812 the Bashkirs, though inferior to the Cossacks, rendered good service. In the Crimean war they were chiefly employed in rough work connected with the transportation of provisions and material. Some of them reside in permanent villages, cultivating the soil,

and raising cattle and bees; others are nomads, wandering from place to place with their flocks and herds, which are numerous, a rich man sometimes having 2,000 sheep and 500 head of cattle. About 400 schools have been established among them, which are attended by about 8,000 children.

BASIL, a name applied to various odoriferous labiates, but especially to the genus *ocymum*. The species of this genus number about 40, and are chiefly indigenous to the East Indies, where some species are regarded with superstitious veneration from their supposed power as disinfectants. Basil has been cultivated in many parts of Europe and America as a garden herb, useful in cooking for flavoring. In Madagascar the roots are eaten. A few species have conspicuous purplish flowers and variegated foliage, and find a place in cultivation among ornamental plants; but these are exceptions, and although the genus is closely allied to *coleus*, well known for its rich foliage, the species are usually recommended by their odor

and not by their appearance. All the species are easily cultivated from seed, and most of them are half hardy in the latitude of Boston.

Sweet Basil (*Ocimum basilicum*).

BASIL, a Bulgarian monk and physician, founder of a religious sect called Bogomiles (Slavic *Bog*, God, and *milui*, have mercy), burnt alive in Constantinople in 1118. His followers believed that before the birth of Christ God had a son Satanael, who revolted, seduced the angels, created the visible universe, and gave the Mosaic law, and that Christ had the mission to destroy the power of Satanael by consigning him to hell under the name of Satan. Basil repudiated marriage, favoring a free intercourse of the sexes, rejected the doctrine of the resurrection, the books of Moses, and the eucharist, abolished baptism, characterized churches as devilish, denounced priests and monks, and would not recognize any liturgy but the Lord's prayer. He condemned all cruelty to animals, and objected to the eating of meat and eggs. In 1111 the emperor Alexis Comnenus convened a synod for the condemnation of the Bogomiles; and entrapping Basil, as their chief leader, into making a confession of his faith, he convened a second synod (1118), calling upon him to retract; but he remained firm, expecting, even while the flames surrounded him, that angels would come to his rescue. See Engelhardt, *Kirchengeschichtliche Abhandlungen* (Erlangen, 1832).

BASIL I., or **Basilus**, surnamed the Macedonian, emperor of the East, born in the province of Macedon about 825, died March 1, 886. At a very early age he was taken prisoner by a party of Bulgarians, who carried him into their country and sold him as a slave. Having obtained his liberty, he proceeded to Constantinople, where a monk caused him to be presented to Theophilus the Little, a relative of the emperor. Accompanying his master to Greece, he won the favor of a rich widow, who made him her heir, and whose wealth enabled

him to purchase large estates in his native country. He continued in the service of Theophilus till 842, when he brought himself to the notice of the emperor Michael III. by vanquishing in single combat a gigantic Bulgarian. He gradually rose to the dignity of chief chamberlain, and repudiated his wife in order to marry one of the emperor's concubines. He formed a conspiracy against Bardas, on whom the dignity of Caesar had been conferred, caused him to be assassinated in the presence of Michael, and soon afterward was created Augustus and recognized as heir apparent. Henceforward, in consequence of the inebriety and incapacity of Michael, the whole administration of the government devolved upon him. The emperor, perceiving himself reduced to a cipher, became jealous and resolved on Basil's ruin; but the plot was revealed to Basil, and on Sept. 24, 867, Michael III. was murdered. Basil was now proclaimed emperor, and during a reign of over 18 years displayed a vigor and ability which few of his predecessors had equalled. He removed the patriarch Photius from the see of Constantinople, because of the religious feuds which he had excited there, and installed Ignatius in his place; reduced the revolted Paulicians to obedience; compelled the Arabs to raise the siege of Ragusa in 872, vanquished them in Syria and Mesopotamia in several engagements, and attempted to drive them out of Italy. His general Procopius was defeated and slain through the treachery of his lieutenant Leo, whom Basil accordingly caused to be mutilated and sent into exile. Basil meanwhile became jealous of his own son Leo, owing to the slanders of a courtier; but, convinced at the last moment of the young man's innocence, he restored him to his affections, and punished his calumniator. The emperor died in consequence of a wound received from a stag. He made a collection of some of the laws of the eastern empire, which was entitled the "Basilican Constitutions," and wrote a small work on the moral, religious, social, and political duties of sovereigns, which he dedicated to his son and successor Leo the Philosopher. This work is still extant; the best edition of it is that published in Göttingen, 1674.—**Basil II.**, emperor of the East, eldest son of Romanus II., born in 958, died in 1025. Romanus had decreed that his infant sons Basil and Constantine should reign together under the guardianship of their mother. Immediately after the death of Romanus, however, their mother married Nicephorus Phocas, and raised him to the throne; and the brothers did not succeed to their inheritance till 976. Constantine gave himself up to licentiousness, and the whole administration of the government devolved on Basil. His reign was a series of domestic and foreign wars. He put down the formidable revolt of Sclerus, defeated the attempt of Otho II., emperor of Germany, to enforce his claim to Calabria and Apulia in Italy, in right of his wife Theophania, the sister of

Basil; and was repeatedly engaged in war with the caliph of Bagdad, from whom he made valuable conquests, and with his old allies the Sicilian Arabs. But his most important war was that which resulted in the conquest of Bulgaria. This war broke out in 987, and lasted, with few intermissions, till 1018. In the first years of it Basil conquered a considerable portion of the southwestern division of that kingdom; but in 996 Samuel, its king, overran all Macedonia and Thessaly, laid siege to Thessalonica, and penetrated into the Peloponnesus. During his homeward march, however, he was encountered by Basil on the banks of the Sperchius, and defeated. In 999 Nicephorus Xiphias, the general of Basil, captured two of the most important strongholds in Bulgaria proper; and in 1002 Samuel again invaded Macedonia and Thrace, and even took Adrianople, but was driven back to his own kingdom. Basil gave his enemies such an overthrow at Zetunium that they never recovered from the blow. On this occasion the emperor showed no mercy to the vanquished. Of 15,000 prisoners he ordered the eyes of all to be put out save those of one in every 100, who was to guide his 99 unfortunate brethren in arms to their native land. The cries of these poor wretches, as they approached the camp of their countrymen, had an effect on the Bulgarian monarch which the shouts of his foes could never produce; he fell to the ground insensible, and expired on the third day after. The conquest of Bulgaria was, however, not entirely completed till 1018, when it became a Greek province and was subjected to the rule of a Greek governor. Basil contemplated the expulsion of the Arabs from Sicily; but in the midst of his preparations for it he was seized with an illness which terminated his life. To expiate the sins of his youth, Basil wore the hair shirt of a monk beneath his imperial robe, and lived the abstemious life of an ascetic. Notwithstanding his incessant wars, he accumulated from his surplus revenue during his reign an enormous fortune, estimated to have been equal to £8,000,000 sterling.

BASIL THE GREAT, a saint of the Christian church, born at Cæsarea in Cappadocia in 328 or 329, died Jan. 1, 379. His father and mother were St. Basil the Elder and St. Emmelia. His father belonged to a noble family of Pontus, which had long been Christian. He had nine brothers and sisters, all of whom, according to the testimony of their intimate friend St. Gregory Nazianzen, were remarkable for sanctity, and three of whom are canonized, viz., St. Gregory Nyssen, St. Peter of Sebaste, and St. Macrina. His early education was superintended by his father, after whose death he continued his studies at Cæsarea, Constantinople, and Athens. He excelled in eloquence and logic, applied himself also to philosophy, natural science, medicine, poetry, and the fine arts, and was one of the most ardent advocates of the study of classical literature and eloquence

in Christian schools. At Athens he formed an intimacy with St. Gregory Nazianzen. He returned to Cæsarea in 355, and opened a school of rhetoric with brilliant success, but soon gave it up for the purpose of embracing a religious life. Dividing the principal part of his property among the poor, he travelled through Syria, Mesopotamia, and Egypt, to visit the most celebrated anchorets and monasteries. In 358 he returned home, was ordained lector by Dianius, and retired to his grandmother's house in Pontus. His mother and sister had already founded a female convent in the neighborhood, on the bank of the river Isia, in which his sister was superior. Basil now founded a monastery, according to some authorities on the opposite bank, according to others at Seleucobol, and in the course of time other affiliated monasteries. He remained in his own convent as superior for four years, when he yielded his place to his brother St. Peter of Sebaste. After his election to the episcopate he continued to watch over these religious homes, and composed rules and spiritual treatises for them; and the principal part of the religious in the East are hence called Basilians. In 359, during a famine, he sold the remaining portion of his property for the relief of the sufferers. Gregory joined him, and has left an interesting account of the life they led in common, in a little hut with a barren garden spot around it, where they found exercise and diversion in cutting stone, carrying wood, planting flowers, and making canals to irrigate the sandy soil. In 362 Basil went back to Cæsarea and took with him a number of his religious brethren, it seems, to found a cloister. Julian the Apostate was now emperor; he had been Basil's fellow student at Athens, and he sent a hypocritical invitation to him to come to his court. This invitation was declined, and was followed by another, which was accompanied by an order to pay 1,000 pounds of gold to the treasurer or be dragged through the city. Basil replied in a very bold and severe style to his old comrade, who soon afterward found his death in the Persian war. In his 35th year Basil was ordained priest by Eusebius, the successor of Dianius in Cæsarea, but for some reason was soon dismissed from the high post which the bishop had assigned him. Eusebius's conduct met with general censure. Basil retired again to Pontus, but in 366 Eusebius was obliged to recall him to Cæsarea, to stem the irruptions which Arianism was making under the auspices of the emperor Valens. In 370, on the death of Eusebius, he was elected archbishop of Cæsarea. During the remaining nine years of his life he presided over this important see in such a manner as to win the reputation of one of the greatest bishops of the church. The whole city followed him to the grave, Jews and heathen wept with the Christians at his death, and St. Gregory Nazianzen pronounced his panegyric. The principal efforts of St. Basil the Great were directed to the defence of the

divinity of Jesus Christ against the Arians. On account of this he is styled by the general council of Chalcedon "the great Basil, the servant of grace, who has proclaimed the truth to the whole earth." He is held in especial veneration in the Greek church, though he was a strenuous supporter of the Nicene creed. His works were first published at Basel with a preface by Erasmus in 1532. The most complete edition is that of Garnier (3 vols., Paris, 1721-'80; reprinted in Paris in 6 vols. 8vo, 1839).

BASILAN, an island of the Malay archipelago, the largest of the Sooloo group, separated by the strait of Basilan, 12 m. wide, from the S. W. extremity of the island of Mindanao; area, about 500 sq. m.; pop. about 5,000. The coast abounds with fish; there are wild hogs, deer, and elephants in the forests. It is a favorite resort of pirates.

BASILIAN MONKS, or *Monks of St. Basil*, a religious order founded by St. Basil the Great, about the middle of the 4th century. When the saint retired into the deserts of Pontus he found there a vast number of solitaries whose manner of life he strove to copy. Crowds of followers gathered around him, and so rapidly did their number increase that he found it necessary to build a large monastery, and to embody in a code of written laws instructions for their conduct. These rules were published in 362, and received the sanction of Pope Liberius. The new order spread rapidly throughout the East, and it is said that before his death Basil saw himself the spiritual father of over 90,000 monks. In the 8th century they were treated with great severity by the emperor Constantine Copronymus, a violent iconoclast. The Basilian rule was translated into Latin by Rufinus, and thereupon passed into the West, where it became the basis of all monastic institutions up to the time of St. Benedict. Great numbers embraced it in Italy, Sicily, and Spain; but, though calling themselves by the common name of "monks of St. Basil," these various communities were independent of each other until Pope Gregory XIII. united them under one head, and at the same time corrected several abuses which had crept in among them during the lapse of years. Various causes have since led to their decline in the West, but the order is still large and important. Their principal monastery is that of St. Saviour at Messina. In Spain, where they are very numerous, the Latin rite is universally followed; in Italy and Sicily they generally conform to the ritual of the Greek church, with a few modifications. Most of the monks of the Greek church in Russia claim to belong to the order of St. Basil, but if so they have deviated widely from their original rule. The historians of the order state that it has produced 14 popes, numerous patriarchs, cardinals, and archbishops, 1,800 bishops, and 11,800 martyrs.

BASILICA (Gr. *βασιλική*, from *βασιλεύς*, king), a term first applied in Athens to buildings in which public business was transacted, and

afterward in Rome to stately edifices of an oblong shape, with four corners, adorned with Corinthian columns, generally used for the administration of justice, and for other public purposes. The first basilica at Rome was built by Cato the Elder, and was called *Porcia*. The *basilica Julia*, built by Vitruvius at Fanum for Julius Cæsar, was supported by 100 marble pillars, embellished with gold and precious stones, and contained 13 judgment seats for the prætors. There were about 20 basilicas in Rome, and one in every provincial town. The only one of which considerable remains still exist is that of Trajan. Among the most celebrated basilicas were those at Palestrina, Pompeii, and Pæstum. Many of them became churches, some of which in the 4th and 5th centuries were called basilicas; and the term was also given to the tomb of Edward the Confessor and other mediæval church-like sepulchral monuments. There are several churches in Rome called basilicas, but the name is chiefly applied in modern times to the five patriarchal churches of St. Peter, St. John Lateran, Santa Maria Maggiore, St. Paul, and St. Lorenzo, the last two being without the walls. Of the smaller basilicas the most important are those of Santa Croce, St. Sebastian, St. Agnes, and San Pietro in Vincoli.—See Bunsen, *Die christlichen Basiliken Roms* (Munich, 1843), and Hübsch, *Der altchristliche Kirchenbau* (Carlsruhe, 1862).

BASILICATA, a province of S. Italy, situated chiefly E. of the main Apennine ridge, and between it and the gulf of Taranto, occupying the greater part of ancient Lucania; area, 4,122 sq. m.; pop. in 1871, 509,089. The chief rivers, the Sinno, Agri, Basento, and Bradano, form extended valleys bounded by offsets from the Apennines, which latter slope gradually toward the sea and settle into low plains within 10 m. of the coast. These plains, famous in antiquity as the plains of Metapontum and Heraclea, are still remarkable for their fertility. The interior is mountainous, rugged, and little visited, and the inhabitants retain primitive modes of life. The principal tree is the pine. The most extensive forests are along the Sinno. In the most northern part of the province, watered by the Ofanto, is the volcanic region of Mount Vultur, which extends N. and S. between 15 and 20 m., and is 20 m. wide. The mountain proper is situated between Melfi and Rionero, and is 3,000 ft. high. Disastrous earthquakes occurred here in 1851 and in December, 1857. Basilicata is rich in cattle, silk, wine, and saffron. Cotton and olive oil are produced moderately. The chief cereals are maize and buckwheat. It is divided into the districts of Lagonegro, Melfi, Matera, and Potenza. Capital, Potenza.

BASILIDES, the founder of a Gnostic sect, who taught in Alexandria about the year 120. Some say that he was born in Egypt, others in Syria or Persia. He taught that the Supreme Being produced from himself seven other

beings, called *sons*. These are, Intelligence (*Noûs*), Reason (*Λογός*), Providence, Wisdom, Power, Peace, and Holiness; these seven, with the Supreme Being himself, constituting the perfect eight (*Ὀγδοάς*). The *sons* Wisdom and Power produced the angels of the first order, who produced those of the second order, and so on to the number of 365 orders, each order dwelling in its own heaven. From Greek letters the numerical value of which is 365 was formed the mystical word *Abrazas*, which became the symbol of the sect founded by Basilides. The seven angels of the lowest order, whose archon or chief was the God of the Hebrews, were the creators of the world. All human souls had committed sins in a previous state of existence, and were consequently excluded from the realm of light. To effect their return to this realm, the *Nous* united himself with the man Christ Jesus at the time of his baptism; but the sufferings which Jesus endured were borne by the man only, and were in expiation, as all suffering is, of sins committed by him in a former state of existence. Basilides forbade marriage and the eating of meat. He wrote a book entitled *Exegetica*, fragments of which are still extant, and several other works, among which is a gospel. His followers, the Basilidians, existed as late as the 4th century; but they soon degenerated from the doctrines of their founder, affirming the God of the Hebrews to be the enemy of the world of light, and became grossly immoral.

BASILISCUS, emperor of the East, died in Cappadocia in 477. Though his early exploits against the Scythians had been far from brilliant, he was through the influence of his sister, the empress Verina, wife of Leo I., placed in command in 468 of the fleet which sailed from Constantinople to Carthage against Genseric, consisting of over 1,100 ships and 100,000 men. The expedition safely reached the coast of Africa, but ended disastrously. Basiliscus, after displaying either the greatest pusillanimity or treachery, fled to Constantinople at the beginning of the contest, and hid himself in St. Sophia until his sister had appeased the wrath of the emperor. He was punished merely with banishment to Thrace. After the death of Leo I. (474) the throne devolved on his infant grandson, Leo II., the son of his daughter Ariadne and of her Isaurian consort Zeno. The latter, hoping to become sole ruler after the suspiciously sudden death of his son, was deposed by Verina and Basiliscus, and Basiliscus was proclaimed emperor by the senate. During his brief administration Constantinople was partly laid in ashes (476), the famous public library with over 120,000 MS. volumes, including the 48 books of the *Iliad* and the *Odyssey*, executed in golden letters, being burned. He burdened the people with taxes, and his rule became so intolerable that Zeno was recalled and Basiliscus and his wife and children were imprisoned in a tower in Cappadocia, where they were left to die of cold and starvation.
